INDEX

CANADIAN MINING JOURNAL, VOL. 31.

JANUARY 1, 1910, TO DECEMBER 31, 1910.

E Editorial. * Illustrated.

Abstract of Report of Mr. Jas. Ashworth, 522-526.*
Acadia Coal Co., 477.
Accidents, Preventable, 323. E.
Accident at Goodwin Lake Mine, Twp. of Lorrain, Jan. 15, 1910, Whereby Frank Shepherd was Killed, 78.
Address by F. H. Sexton, Director of Technical Education, Nova Scotia, 435-6.
Advance Chapter From H. P. Davis' Handbook of the Cobalt District, 136-7.
Africa—Gold Coast, 770.
Ainsworth and Slocan Districts, Mining in, by E Jacobs, 143-5.
Alaska, 221, 350, 771.
Alberta, Coal Mine Branch, Annual Report of Department of Public Works of the Province of, 656-663.*
Alberta Provincial Coal Mine Officials' Examinations, 690-4.
Amalgamated Asbestos, 613. E.
Amalgamated Asbestos Corporation, 476.
Amalgamated Asbestos Corporation, Fire Protection at the Plants of the, 727.
Amalgamated Copper Co., 672.
Amalgamation and Cyanidation, The Electrochemical System of, by Elmer Ellsworth Carey, 18-20.
Amalgamation, Electrolytic Cyanidation and, by E. E. Carey, 393-4.
Amendment to The Criminal Code, The, 360.
American Labour Unionism in Canada, 583.
American Mining Congress, 717.
Anderson, G. R., on Photography at University of Toronto, 716.
Annual Meeting of The Canadian Mining Institute, Toronto, Mar. 2nd, 3rd, and 4th, 1910, Proceedings of the Twelfth, 163-5.*
Annual Meeting of the Mining Society of Nova Scotia, Halifax, March 15 and 16, 1910, The Eighteenth, 195-7.*
Annual Report of the Department of Public Works of the Province of Alberta, Coal Mine Branch, 656-663.*
Annual Report of the Nova Scotia Department of Mines for 1909, 260-265.*
Are British Columbia Ores Improving? by E. Jacobs, 531-2.
Argumentative Outfit, An, by John Ravenor Bullen, 182.
Asbestos, 710.
Asbestos Bureau, 62.
Asbestos Deposits in the Eastern Townships of Quebec, On the Distribution of, by John A. Dresser, 465-470.*
Asbestos Industry, The, by J. J. Harpell, 50-52.
Asbestos Mining in Quebec, Notes on Recent Developments in, by W. J. Woolsey, 434-5.
Ashworth, Jas., on Testing Safety Lamps, 12-13.*
Ashworth, Mr. James, Abstract of Report of, 522-526.*
Australia, 29, 61, 124, 220, 349, 509, 540, 609, 641, 737.
Australia, Electrolytic Copper Refining and Smelting in, 433.
Australian Nobel Dynamite, 329.
Austria, 251, 413, 641, 770.

Badgley, C. W., on Estimation of Nickel and Cobalt, 588-9.*
Barite in Washington County, Missouri, The Geology, Mining, and Preparation of, by A. A. Steel, 138-143.
Barnstead, Arthur S., on Nova Scotia's Mineral Output in 1908, 74-76.
Bartlett Fiasco, The, 67. E.
Bathurst District, New Brunswick, by G. A. Young, 488-492.*
Belgium, 770.
Bell's Asbestos Co., 319.
Bitter Creek, B.C., 498.
Blast Furnaces, The Mechanical Charging of, by E. J. W. Richards and Thomas Lewis, 420-8.*
Book Reviews—
Index of Mining Engineering Literature, 23.
Metal Statistics, 1910, 148.
The Mining Manual, 1910, 148.
The Colliery Managers' Pocket Book, Almanac, and Diary for the Year 1910, 148.
A Text-Book of Ore Dressing, 183.
The Chemistry of Cyanide Solutions Resulting From the Treatment of Ores, 183.
The Copper Handbook, Vol. IX., 277.
Telephonology, 407.
The Corrosion and Preservation of Iron and Steel, 407.
The Coal and Iron Industries of Nova Scotia, 439.
From Prospect to Mine, 548.
Ore Mining Methods, 548.
Canadian Annual Review of Public Affairs—1909—The, 548.
Dictionary of Metallurgical and Chemical Material, 622.
Rock Drills,—Design, Construction and Use, 713.
Modern Assaying, 714.
Practical Data for the Cyanide Plant, 714.
Testing for Metallurgical Processes, 744.
Practical Stamp Milling and Amalgamation, 744.
Brick, 265.
Briquetting Iron Ores, 712. E.
Briquetting of Iron Ores, The, by C. C. De Schwarz, 599-603.
Bristol Mine, Pontiac County, Quebec, The, 493-4.
Britain, Mine Rescue Work in, 728.
British Columbia Coal Mine Inspection, 712. E.
British Columbia Copper Co., 286, 642, 672.
British Columbia, The Engineer Group, Atlin Mining Division, by E. Jacobs, 528-9.
British Columbia Mines, Losses by Fire at, 492-3.
British Columbia, Mine-Rescue Stations in, 460.
British Columbia Mining and Smelting Conditions in, 236-9.
British Columbia in 1909, Mineral Production of, 457-460.
British Columbia in 1909, Mining in, by E. Jacobs, 38-44.
British Columbia, New Mining Field in, 697-8.*
British Columbia, Ore Production in, 436-7.
British Columbia Placer Gold Mining in, 405-6.
British Columbia in 1908, Review of Mining in the Province of, by Geo. A. Ohren, 5-7.
British Columbia Smelteries, Ore Receipts at, 732.
British Columbia, Special Correspondence, 26-7, 58-9, 91-2, 122-3, 150-1, 187-8, 217-218, 283-4, 346-7, 378-9, 411-413, 443-4, 474-5, 506-7, 537-8, 570-1, 607-8, 637-9, 669-671, 704-5, 735-6, 766-8.
British Columbia, Zinc Mining in, 274-5.
British Columbia, The Zinc Mining Industry in, 20-22.
British Mineral Rights Taxation, 56.
Brown, Thomas J., on The Use of Coke-Oven Gas as Fuel, 234-6.
Bruce Peebles & Co., 116.
Brussels Exhibition, Canadian Minerals at the, 463-4.*
Buffalo Mines, Ltd., 510, 672.
Building Stone, 265.
Bullen, John Ravenor, on—
An Argumentative Outfit, 182.
The Dinner Hour, 464.
Bureau of Mines Report, Ontario, 731.
Business Honour, 259. E.

Cairnes, D. D., on Forestry and the Coal Areas of the Yukon Territory, 131-132.
Campbell, D. F., on Electric Steel Refining, 695-7.
Carey, Elmer Ellsworth, on The Electrochemical System of Amalgamation and Cyanidation, 18-20; on Electrolytic Cyanidation and Amalgamation, 393-4.
Carter, W. E. H., on The Porcupine Gold Area, 361-366.*
Cobalt Mine Royalties, 757.
Copper Mine, Observatory Inlet, B.C., Hidden Creek, 763.
California, The Folsom Dredge Working Placer Ground in, by F. C. Perkins, 500.*
Canada Iron Corporation, 610.
Canada, Mining and Metallurgical Opportunities in, by A. B. Willmott, 527 and 552.
Canadian Annual Review of Public Affairs, The, —1909—Book Review, 548.
Canadian Iron and Steel, by Watson Griffin, 207-8, 231-4, 324-327, 388-393.
Canadian Manufacturers' Association, 501-503.
Canadian Minerals at the Brussels Exhibition, 463-4.*
Canadian Mining Institute, 242, 460, 616.
C. M. I. Committee at Ottawa, The, 193. E.
Canadian Mining Institute, The Quarterly Bulletin of the, 66. E.
Canadian Mining Institute for the Year 1909, Report of the Council of the, 76-78.
C. M. I., Toronto Branch, 731.
Canadian Mining Institute, Toronto, March 2nd, 3rd and 4th, 1910, Proceedings of the Twelfth Annual Meeting of the, 163-5.*
Canadian Mining Institute's Twelfth Annual Meeting, The, 129. E.
Canadian Mining Institute—Western Branch, 143, 197-8, 329.
Canadian Patents, 147, 279, 404, 438-9,* 604.
Canadian Westinghouse Co., 578.
Chambers-Ferland Co., 642.
Charging of Blast Furnaces, The Mechanical, by E. J. W. Richards and Thomas Lewis, 420-8.*
Charts, Two, 387.
Chemistry of Cyanide Solutions Resulting From the Treatment of Ores, The—Book Review, 183.
Chibougamau Commission, The, 335-6.*
China, 124, 540, 737.
City of Cobalt Mining Co., 672.
Claims Assessment Work in the Province of Ontario, by James Rennie, 210-211.*
Clay and Shale Deposits of Nova Scotia and Portions of New Brunswick and Prince Edward Island, The, by Heinrich Ries, 470-1, 499-500.
Clubs, Societies, and An Editor, 353. E.
Coal, 260-3.
Coal Areas of the Yukon Territory, Forestry and the, by D. D. Cairnes, 131-132.
Coal and Iron Industries of Nova Scotia, The—Book Review, 439.
Coal in Nova Scotia, The Cost of, Hon. Robt. Drummond, 44-45.
Coal Mine Branch, Annual Report of Department of Public Works of the Province of Alberta, 656-663.*
Coal Mine Officials' Examinations, Alberta Provincial, 690-4.
Coal Mines, Oxygen Breathing Apparatus in Pacific Coast, by E. Jacobs, 334-5.
Coal Mines Regulations Relating to Submarine Areas, Report on, by T. E. Forster, 267-9.
Coal Mines, Rescue Apparatus in, 369-370.
Coal Mining in Alberta During 1909, 615. E.
Coal Mining Regulations, The New Federal, 321. E.
Coal, The Price of, 527.
Coal, Reciprocity in, 684-6.
Cobalt During 1909, 45-47.
Cobalt, Estimation of Nickel and, by C. W. Badgley, 558-9.*
Cobalt in 1910, by A. A. Cole, 199-207.*
Cobalt, The Nissen Stamp in, 87-88.
Cobalt, A Protest From, 226. E.
Cobalt Provincial Mine, The, 343.
Cobalt, Special Correspondence, 25-6, 57-8, 89-91, 120-122, 149-150, 185-7, 215-217, 248-9, 281-2, 314-315, 344-5, 376-8, 410, 441-2, 472-3, 504-5, 536, 568-9, 605, 636-7, 667-8, 701-3, 733-4, 765.
Cobalt, Steam Driven Air Compressors In, by H. V. Haight, 209-210.*
Coke Ovens and Direct Ammonia Recovery Process, Koppers By-Product, 496-8.*
Coke-Oven Gas as Fuel, The Use of, by Thomas J. Brown, 234-6.
Cole, A. A. on Cobalt in 1910, 199--207.*
Colliery Manager's Pocket-Book, Almanac and Diary for the Year 1910, The, Book Review, 148.
Colvocoresses, G. M., on Present Developments at Gowganda, 584-9.*
Commendation, 323. E.
Company Notes—
Maritime Coal, Railway and Power Co, Ltd, 672.
La Rose, Third Annual Report, 672.
Trethewey Mining Co, 610, 672.
Nipissing Mines Co, 94, 254, 446, 578, 672.
Buffalo Mines Co, 222,, 254, 510, 672.
Amalgamated Copper Co., 672.
British Columbia Copper Co, 125, 221, 286, 578, 642, 672.
City of Cobalt Mining Co, 672.
Granby Consolidated, 190, 642, 673.
Wyandoh, 738.
Temiskaming & Hudson Bay, 510, 578, 740.
Canadian Westinghouse Co, 578.
Canada Iron Corporation, Limited, 578.

Temiskaming Co, 286, 350, 541, 578, 737, 740.
La Rose. 578.
Canada Iron Corporation, 610.
Kerr Lake Mining Co, 286, 610, 737.
Van Roi Mining Co, Limited, 641.
Chambers-Ferland Co., 642.
Van Roi Mining Co, Ltd, 446.
Amalgamated Asbestos Corporation, 476.
Crown Reserve Mining Co., 30, 125, 223, 477, 673.
Lake Superior Corporation, 414, 477, 610.
Acadia Coal Co., 477.
Coniagas Mines, 477.
Crow's Nest Pass Coal Co, 510, 738.
McKinley Darragh Savage, 542.
Dominion Coal Co., 252, 286.
Bell's Asbestos Co., 319.
Van Roi Mining Co, Ltd, 382, 446, 641.
Dominion Steel & Coal Corporation, 382.
McKinley-Darragh Co., 155, 382, 738.
Amalgamated Asbestos Corporation, 414.
New Dominion Copper Co., 446.
Nevada Consolidated Copper Co., 446.
Intercolonial Coal Mining Co, 190, 350, 542.
Dominion Iron & Steel, 190, 254, 414.
Nova Scotia Steel & Coal Co., 155, 190, 253.
Western Coal & Coke Co., 125, 190.
Yukon Gold Company, 221.
Pacific Pass Coal Fields Co., 222.
International Nickel Co., 223, 382.
Calumet & Hecla, 286, 382.
Asbestos Bureau, 62.
North Star Mining Co., 63.
International Coal & Coke Co., 94.
Dominion Coal Co., 125.
Le Roi Mining Co., 125, 542.
Peterson Lake Silver Cobalt Mining Co., Ltd., 153, 318.
Trethewey Silver Cobalt Mines, Ltd., 154.
Portland Canal Mining Co., Ltd., 62, 156.
Comparison, A., 67. E.
Compressed Air in a Canadian Mining Camp, Costs of Producing, by R. L. Webb, 102-111.*
Compressed Air Question in Cobalt, The, 386. E.
Compressors in Cobalt, Steam-Driven Air, by H. V. Haight, 209-210.*
Concentration, The Elements of Slime, by Walter McDermott, 299-303.
Concerning Nova Scotian Gold, 482. E.
Concerning One Appointment, 387. E.
Concerning Ourselves, 418. E.
Condition and Needs of Mining in the Yukon, by F. T. Congdon, M.P., 71-74.
Congdon, F. T., M.P., on Condition and Needs of Mining in the Yukon, 71-74.
Coniagas Mines, Limited, 477.
Conservation and Common Sense, 290. E.
Conservation Work of the Geological Survey for the Year Ending March 4, 1910, 175.
Conservative, by P. W. Hunt, 716.
Consolidated Mining and Smelting Company of Canada, Limited, The, 631-4.
Consolidated Mining and Smelting Company of Canada, Limited, 484-7.*
Contribution to the Philosophy of Shipment Sampling, by Joseph T. Mandy, 718-722.*
Copper, 265.
Copper Handbook, Vol. IX., The, Book Review, 277.
Copper Handbook, The History of Stevens', by Horace J. Stevens, 145-6.*

SULLIVAN DIAMOND CORE DRILLS

IT IS EASIER to string wires than to lay pipes or haul boilers. So there are many cases in which electricity is more convenient than steam or air for operating Diamond Drills.

Sullivan Electric Diamond Drills are made in any capacities, for either direct or alternating current. Their compactness and adaptability permit operation either underground or from the surface. Holes bored at any angle.

THE YEAR 1909.

A Review.

When, one year ago, we reviewed the growth of Canadian mining during the previous twelve months, we expressed the belief that the year 1909 was to be a period of strong expansion. Events have proved this belief to have been well founded. The past year has brought health and strength to almost every department of mining in the Dominion. Indeed, the commercial and financial conditions have been excellent; and rich accessions, in the way of new mining territory, have been added to our stores of mineral wealth. As a nation, Canada looks forward to the coming year not only without misgivings but with sturdy confidence. Never before were the prospects so good for the industry that we represent; and, most certainly, never before have the people of Canada been so widely interested in that industry. For the past year we have much for which to be thankful; that the dawning year will bring us more is, humanly speaking, certain.

We shall survey now the salient points in the history of each mining Province during 1909.

Nova Scotia.—Beginning with Nova Scotia, the events that centred round Glace Bay first command attention. Whilst early in the year all things pointed to a heavy shipping year for the Dominion Coal Company, even then a cloud, the size of a man's hand, had gathered in the horizon. The intention of the United Mine Workers of America to paralyze the company's business by precipitating a strike at the opening of navigation was rumoured. The strike became an accomplished fact in July. The U.M.W.A. prepared its campaign in a manner peculiar to itself. Throughout the United States, for instance, it worked upon the sympathies of its adherents by disseminating grotesque fictions as to the conditions of labour at Glace Bay. To its followers in the employ of the Dominion Coal Company, it held out promises equally grotesque. But the U.M.W.A. made a sad mistake in underestimating the strength of the local Provincial Workmen's Association, a body that the foreign organization had resolved to disrupt. After a few months of costly and absolutely needless "strike," the U.M.W.A found itself in a humiliating position. By its own action it had given assured and lucrative employment to the members of its rival, the P.W.A.; and, after depriving two or three thousand of its own followers of work, it was quite unable to assume the responsibility of supporting them. The outcome was inevitable. After a period of light shipments, the Dominion Coal Company gradually resumed its normal outputs. This was made possible by the fact that throughout the strike the leaders and men

of the P.W.A stuck fearlessly to their colours and refused to be dominated by imported demagogues.

Throughout the year the U.M.W.A. succeeded in shutting down several coal mines, including the collieries of the Cumberland Railway and Coal Company. In no sense, however, was the agitation finally successful. The net effect was a loss to the Province, to the companies, and, especially to the miners, of several millions of dollars. While the experience has been expensive, we have no hesitation in stating that the the U.M.W.A. has lost its hold upon Nova Scotia. And for this blessing hardly any price is too high.

That long-desired consummation, the amalgamation of the Dominion Iron and Steel and Dominion Coal is now assured. The legal victory of Steel over Coal led, by perceptible degrees, to this momentous step. This victory, the consequent improvement in Dominion Steel finances, the re-organization of its huge plant, together with a successful year, helped to balance matters. From geographical and industrial reasons the two concerns were always intended for each other. May the union prove fruitful.

Gold mining in Nova Scotia has not yet been galvanized into life. The whole Province outputs scarcely as much as comes from a few Rhodesian prospects; and this despite ideal working conditions, favourable legislation, and extensive unprospected territory. On this subject we shall touch in a later editorial. We shall, however, record here our conviction that the gold mines of Nova Scotia, maugre all reports to the contrary, will repay proper investigation.

At this date official returns as to iron ore, gypsum, limestone, etc., are not available. But indications point to a sustained output in all minerals save coal. The falling off in this commodity is due entirely to the action of the U.M.W.A.

Nova Scotia's present needs, from the point of view of mining, are, firstly, the services of a competent, commercially-trained mining geologist; secondly, discriminate publicity; and, thirdly, a complete diagnosis of the present condition of its mining industry generally by a commission of unimpeachable specialists.

New Brunswick.—Except for gypsum and limestone quarries, and a light production of coal, New Brunswick has hardly qualified as a mining province. The iron deposits of the Canada Iron Corporation, Ltd., are to be a large asset. Antimony mining, recommenced this year on a small scale, has been suspended temporarily. Near Moncton, gas and oil prospects, under the management of English interests, are showing up encouragingly.

Indifference to her mineral wealth is the prime cause of New Brunswick's backwardness. A well-organized Bureau of Mines is badly needed.

Quebec.—Quebec has been the scene of many changes. The organization and flotation of Amalgamated Asbestos, which embraces under one administration the bulk of the chief asbestos-producing mines, have been sufficiently commented upon. The excessive capitalization of this consolidation will require to be offset by close technical management and by comprehensive marketing facilities. Black Lake Consolidated, a consolidation of several asbestos mines that are not at present producing, has been favourably reported upon as to ore in reserve and ore indicated.

The erection at Lachine of a large plant for the manufacture of finished asbestos products, marks a departure. This will assuredly bring about an increased demand.

The mining of mica has been quiet. For chrome ore the market has been sporadic.

The attempt to create interest in alluvial gold in Eastern Quebec appears to have been but a flash in the pan. Of silver in the Ville Marie district it is hard to obtain definite news.

The Province of Quebec, since the resignation of Mr. J. Obalski, has been without a technical officer in the local Department of Mines. Good men are scarce, but they are obtainable. The man to fill Quebec's requirements must have special knowledge of the land and of the people. Also, unless his energies are to be unprofitably dissipated, he must have a corps of assistants. The late changes and amendments in the Quebec mining laws give the prospector and investor a much better chance. But the public require more authentic information as to the whole Province. A strong Department of Mines is, therefore, a pre-requisite.

Ontario.—The mining industry of Ontario is waxing fat. Cobalt has contributed about twelve million dollars worth of silver during the year, and has abated not a jot or tittle of her vigour. South Lorrain is coming to the front. Gowganda, wounded almost mortally by over-capitalization, still shows signs of life. The Elk Lake region is holding its own. To the west and south of Gowganda, many new prospects await development. Cobalt money has been invested in one or two of the old Thunder Bay mines—not unwisely. The cobalt-silver smelters are all doing well. On the whole, the outlook for silver is most hopeful.

Ontario gold-mining, always an uncertain quantity, has received a decided fillip. The reports that come from Porcupine, north-east of Cobalt, are, to say the least, very interesting. Although opinion must be based upon insufficient data, there seems to be reason to regard the Porcupine region as one of exceptional promise. Wide ore-bodies, in which are spectacular superficial showings of gold, have been stripped. Men who have made their money in Cobalt are buying claims at fancy prices and, strange to relate, one English concern is already on the spot. This is as enterprising as it is exceptional.

The mining of iron-ore is progressing slowly. Several large purchases of mines and prospects have been made in Eastern Ontario, and a number of smaller

transactions have been arranged in the western ranges. At least two new blast furnaces will be put in commission during 1910.

Copper and nickel, as usual, form the backbone of Ontario's mineral production—although, to make the figure apposite, silver will have to be compared to some more important part of the Province's anatomy, possibly the heart and lungs.

We cannot here do more than mention a few of the other minerals of the Province. Mispickel, iron pyrites, talc, marble, feldspar, and corundum are the bases of growing industries. The decrease in oil production is counter-balanced by an increase in the supply and use of natural gas. The clay and cement industries are thriving.

As a whole, mining in Ontario is in good shape. Its mining administration, though by no means inerrant, is honest. Its mining laws, complicated to a most exasperating degree, must soon be revised and simplified. But not even the most wretched laws can stem the tide of prosperity that has set in.

Alberta.—The coal-mines of Alberta, from all indications, will have produced considerably more coal during 1909 than during the preceding year. And this despite the strike of the miners employed in the southern part of the Province—a strike that for a time embarrassed copper smelters in south-eastern British Columbia.

The plans of the German Development Company, and of several other large concerns, are maturing. When railway connections shall have been completed, Alberta's coal output will rapidly assume proportions incomparably larger than its present production.

Exploration for natural gas, particularly at Bow Island, has developed large flows. Oil has not been encountered as yet.

British Columbia.—Our westernmost Province, British Columbia, is dealt with preliminarily on another page. The events that stand out with prominence may, however, be noticed here. In the Boundary country, copper smelting has made headway. Although the total tonnage for the year will be lessened by the fuel shortage that affected the British Columbia Copper Company, and by the suspension of work at the mines of the Dominion Copper Company, yet the activities of the Granby and of the Consolidated mining and smelting companies helped to fill the gap. Dominion has now been reorganized and is in operation. Granby has increased its furnace capacity considerably, and Consolidated Mining and Smelting is handling more ore than ever.

Rossland gold-copper mines are in good condition, although shipments have dropped as compared with 1908. Sheep Creek gold-mining is coming to the front. Considerable capital from London and from Montreal has found its way into the camp.

Renewed activity has been observable on the Queen Charlotte Islands and in the Portland Canal district.

Zinc mining will probably take a new lease on life as a result of the Convention held at Nelson on Dec. 15th. Concerted action of this kind is infinitely more effectual than is the advocacy of any number of individuals.

On the coast, coal outputs have increased. To the east, the Crow's Nest Pass Collieries are getting into normal condition. Other collieries have had fair seasons.

British Columbia is yet pre-eminently the mining Province of the Dominion, mainly because of a measure of co-operation amongst mine-managers and because, also, of a lively appreciation on the part of the Local Government of what successful mining means to any country.

Yukon.—Sufficient evidence is already to hand to prove that the gold returns from the Yukon for 1909 will exceed those for 1908 by a considerable quantity. The cheap electric power, generated at a colliery 43 miles north of Dawson, is now available. This will bring into the category of payable propositions much untouched placer ground. The achievement of Yukon Gold, which company succeeded in getting a flow of water in its fifty-mile long ditch, is worthy of record. The approaching dividend on Yukon Gold shares, incidentally, may be an isolated occurrence. Shareholders should enquire carefully into costs and reserves.

Technical Education.—Following the example of Nova Scotia, Quebec has adopted measures to provide useful technical training for the rising generation. New Brunswick lags behind. Ontario's elaborate system needs modification. The western Provinces are evolving institutions of their own. We rejoice to notice that the subject of technical training is engaging the thoughts of several members of the House of Commons.

Conservation of Natural Resources.—Canada's new sense of nationhood has broadened her in several directions. It has opened her eyes to the advisability of following the lead of other nations in conserving her resources. Our Federal Government is wisely looking into problems of forestry and kindred questions; but, so far, no steps have been taken to apply the principles of conservation to mining. This will and must come.

Legislation.—Two Provinces, Nova Scotia and Quebec, have effected notable changes in their mining laws. In both cases the changes have been improvements.

A Select Standing Committee of the House of Commons deliberated during last session on subjects pertaining to mining laws. Little was accomplished. More is hoped for this year, especially in the direction of codifying a Dominion mining law and placing the administration of that law in competent hands. The present situation is intolerable.

Departmental.—The two branches of the Federal

Department of Mines, the Geological Survey and the Mines Bureau, have grown in grace in the past twelve-months. The Survey, being the parent stem, is, of course, superior in organization, larger in scope, and incomparably more important than the newer limb. But to each credit is due. Publications have been improved. Work has been systematized, and much will be expected of both branches during the coming year.

THE ZINC PROBLEM.

The mining convention, held in Nelson, B.C., on December 15th, should be fruitful of good. On another page is given extended notice of the proceedings. A few general points require discussion.

The convention was called for the purpose of defining the present condition of zinc ore mining in the Kootenays, and to formulate a memorial to the Dominion Government setting forth the needs of the industry..

The present annual production of zinc ore in British Columbia is small and uncertain. The electric smelting plant at Nelson has failed to produce the metal on a commercial scale. Hence the market must be found in the United States.

But the annual consumption of zinc and zinc products in Canada represents an outlay of nearly eight hundred thousand dollars. Much of this material is imported from the United States. Practically none of it is manufactured in Canada.

The metallurgical treatment of the lead-zinc and other zinc-bearing ores of southeastern British Columbia is the crux of the question. Could this be solved, British Columbia could readily supply the whole of Canada and, probably, compete in foreign markets.

Recognizing this, the convention memorialized the Dominion Government, requesting that the Federal Mines Branch be authorized to undertake the investigation of the electro-thermic reduction of zinc ores.

For several reasons it was thought that to ask assistance in the shape of a bounty would be impolitic. In the first place, the zinc-smelting industry is not yet established; secondly, a clause in the Payne tariff provides for the imposition of additional duties against goods produced in other countries under a system of bounties.

While it was suggested during the meeting that the plant of the Canada Zinc Company, at Nelson, might be put at the disposal of the Mines Branch for experi mental work, it was clearly understood that the Canada Zinc Company, as a company, had had nothing to do with bringing about the convention.

A strong committee of five has the whole matter in hand. Funds have been raised to defray expenses; and there is every appearance of earnestness about the movement.

We endorse most heartily the request embodied in the memorial. The Dominion Government can, and, no doubt, will, come to the aid of the Kootenay operators. The Mines Branch has never been called upon by more responsible men. Its services are needed. It has a splendid opportunity of proving its usefulness.

"INSPECTION OF MINES."

Our attention has been drawn to the fact that a sentence in one of our editorials, November 1st, is open to misconstruction. The sentence occurs in an editorial headed "Inspection of Mines." It reads thus: "So long as inspection is left entirely to provincial officials it will be neither adequate nor effective."

Isolated from its context, this sentence might be interpreted as a harsh criticism of our various provincial inspectorates. This we did not intend. The editorial in question referred specifically to inspection of coal mines, and to the need that exists of the co-operation of the Dominion Department of Mines.

As regards the inspection of our metalliferous mines, and we now refer particularly to Ontario, the only criticism that we can make is that there is not enough of it. What there is of it is surprisingly effective. But the Ontario Government is slow in appreciating the situation. Its one inspector has given intelligent, devoted and constant service for four years. The results of his labours are shown in largely decreased death-rates amongst mine employees. With a small staff of deputies, the Ontario Inspector of Mines would be at liberty to attend more closely to the higher phases of his duties.

This, we hope, will appeal to the common sense of Ontario's not unintelligent administration.

A HAPPY NEW YEAR.

To our readers we extend the season's greetings. We hope that during the year 1910 each will arrive closer to the desire and purpose of his days. Further, we hope that every day of the New Year will bring some new delight.

Dr. Ludwig Mond, one of the most notable figures in modern industrial chemistry, died in London, England, on December 10th. Canadians will remember Dr. Mond more particularly for the process of copper-nickel reduction and separation of which he was the inventor.

REVIEW OF MINING IN THE PROVINCE OF BRITISH COLUMBIA IN 1908.

By George A. Ohren.

The calendar year 1909, in all its varied aspects, now lies behind us. The interesting sequence of events that have transpired in the growing mining industry of British Columbia at this moment but remain a mere matter of history; these events having their influence upon the future, of course, but, nevertheless, being relegated to the dead past. Part of the general scheme of advancement, looked forward to as the year was ushered in, has become a realized fact; many expectations that were sanguine during the early months have been hopelessly shattered. Horizons that then appeared nebulous and cloudy have since cleared and brightened, and despite the several little retrogressions in some quarters the year was fraught with the elements of progress and it can be truthfully said that another step forward has been taken.

In the Boundary, the premier mining district of the Province, substantial advancement was looked for during 1909. While some of the marks of progress, outlined at that time, have been duly passed, others are still lying before us in the impending future. The disabling of the electric power system that supplies the mines, by the cold weather of early January, caused somewhat of a set-back. The strike of coal miners in Southern Alberta was the occasion of a grave depression in the tonnage shipped from the mines of the B. C. Copper Co. for nearly four months. Activity in the affairs of the Dominion Copper Co. was mostly confined to reorganization and untangling legal knots, and little or no work was done on the mines until near the last of the year, when diamond drill exploration was started on the Rawhide, the leading mine controlled by that company.

The Granby Consolidated M. S. & P. Co., taking advantage of the low price of copper, augmented, in turn, each of its eight big furnaces at the Grand Forks smelter. The last furnace was completed and blown in during the early part of December. The furnaces were lengthened from 18 to 22 feet and made four feet wider. This increased the capacity of the smelter from 3,500 to 4,500 tons per day. The lately completed convertor plant has a capacity of 40,000,000 lbs. copper per annum. The total receipts of the Granby smelter in 1908 amounted to 1,049,670 tons, and the receipts for the year 1909 will just about equal or slightly surpass these figures. A 2% dividend was paid in December. The management of this company has not tried to make an extraordinary year's production, but has worked along on a sane basis and taken steps to improve conditions for times when metal prices will be stronger.

Although the mines of the British Columbia Copper Co. were closed down for several months on account of fuel shortage, the ore shipments from its mines to the company's Greenwood smelter will total approximately the figure of 1908, or about 360,000 tons. A change in the mine management took place October 1st, when P. S. Couldrey, erstwhile manager, Le Roi 2, Ltd., Rossland, took charge. The ore shipments were noticeably heavier shortly after this change. On the Oro Denoro mine operated by this company, extensive development work was done and much ore located.

The Consolidated Mining & Smelting Co. of Canada, Ltd., operating the Snowshoe-Phoenix Amalgamated, will ship over 100,000 tons more from the Snowshoe in 1909 than during the previous year. A tramway has been built on the Amalgamated and the railway spur will soon be completed, so that the output for this group in 1910 will be record-breaking.

The Greenwood-Phoenix tunnel was driven a couple of hundred feet; the Argo tunnel, at Greenwood, is in nearly 300 feet, and one 20-inch galena vein cut. The Sally shipped 130 tons of $125 ore. The Golden Eagle sent 330 tons to Grand Forks smelter. The Bruce mine shipped 210 tons, and the Crescent 20 tons of select ore: Little Bertha, 30 tons.

It will be seen that had the Dominion mines shipped an average tonnage and the B. C. Copper Co. not been compelled to shut down, that the total output of the Boundary would have greatly exceeded that of 1908, but, as it is, the matter has been deferred, and with the new equipment of the Granby smelter it will be possible in 1910 to exceed all past records, which will easily be the case if things in general are only normally favourable.

While the Great Northern Railway Company pushed its branch as far as Princeton in the Similkameen during the past year, this move did not lead to the shipping of ore that will likely take place in 1910. The Nickle Plate mine was lately bought by a New York development syndicate, new machinery added to the old plant, and extensive production for next year is planned. The Vermilion Forks M. & D. Co. has opened up its coal mines and will produce on a moderate scale from the present. The Kingston, Golden Zone, Number Four, and Bear Creek mines were under development all year.

In the Rossland gold-copper district, the Consolidated smelter and refinery at Trail will show an increase of nearly $1,000,000, or approximately $6,000,000 in production of gold, silver, copper and lead, over 1908. An addition to the refining plant was made during the year and a new copper furnace put to work. At the Centre Star-War Eagle group of the Consolidated M. & S. Co. of Canada, Rossland, the ore production for 1909 will approximate 175,000 tons, 10,000 or 15,000 tons below 1908. The company acquired the City of Spokane, Mugwump, and other mines contiguous to the Centre Star during the year and has a large reserve of ore. The production of the Le Roi 2, Ltd., will also fall a few thousands below 1908, but this is not surprising as the main shaft was retimbered and sunk from the 950 to the 1,350 level. This concern paid six shillings ($1.44) per share in three equal dividends during the year, and it is expected will pay another two-shilling dividend from the net profits of 1909. As the Le Roi mine was not shipping from the middle of March until the last week in October, the output of that mine this year will only total about 10,000 tons. The property was inactive for nearly five months while

a plan of development and financial policy was being outlined in London. Two diamond drills are at work as the year closes, probing the ground from the 1,650-level downward—possibly the work will be extended to the 2,650-level. A crew of about 80 men is at work, and mining and shipping on a small scale going on. Several of the smaller mines were worked under lease during the early months but with indifferent success. It is to be hoped that 1910 holds better things for this camp than 1909 did, but the outlook is none too bright just now, taking the camp as a whole. Rossland shipments will fall nearly 100,000 tons below 1908 for the past year, or approximately 200,000 tons, that would probably average close to $11 per ton.

The Sheep Creek gold district, near Nelson, is principally responsible for an increase in Slocan-Kootenay shipments of about 50,000 tons of rather high-grade. The quantity of ore mined and sent to concentrator and smelter during 1909 will figure, roughly, 350,000 tons, whereas for 1908 the total was about 295,000 tons. The big Blue Bell lead-zinc property doubled its output, milling 46,000 tons. The big St. Eugene silver-lead property of the Consolidated held its own, but has lowered its ore reserve by nearly one-third. The Silver King, at Nelson, was operated from April until shut down by fire in August, resuming shipments in November. In the Slocan the Richmond-Eureka and the Van-Roi took a more stable position on the shipping list. It was in the Sheep Creek-Ymir district, however, that substantial tonnages were taken from the Queen, Nugget, Kootenay Bell, and Yankee Girl. The Second Relief also doubled its previous yearly output. Steps are being taken to place the growing zinc mining industry of this district on a more substantial basis. Government aid will be invoked toward experimental work, a bounty on zinc mined will be sought and a higher tariff advocated on manufactures of zinc now coming into this country. The bounty now existing on lead mined here has been a great stimulus to the industry, and it is thought the fostering of the zinc industry would tend to open large mines now idle and help the smaller mines. It would probably solve the great object in the zinc question here, and that is a commercial zinc smelter in this district.

In East Kootenay the Sullivan group was taken over by a new company, the Fort Steele M. & S. Co., during the year, and while there were many rumours of the resumption of work active operations were not begun. It is likely, though, that work on this big lead-zinc mine will be started early in 1910.

It was in the coal fields of this district that good progress was made during 1909, although the tonnage shipped may not surpass that of 1908 by very much. The Crows Nest Pass Coal Co. operated almost without interruption during the year, erected a new 3,000-ton tipple at Michel and installed two high pressure (1200) and one low pressure compressors. Also began the installation of another 1,000 coke ovens. The Hesmer Mines (C.P.R.), capacity 3,000 tons per day, also made a substantial output. The Corbin Coal & Coke Co., Corbin, installed a high pressure compressor, boilers, air locomotives, etc., and maintained a small output, which will be materially increased in 1910. The McGillivray Creek Coal Co., near Coleman, opened up its property and spent over $200,000 on tipple, buildings, and plant, and will show a good output for next year. The output of the International Coal & Coke Co., Coleman, will be somewhat reduced on account of the three months' strike of its miners. As it is, the figures will be about 390,000 tons of coal and 53,000 tons of coke. Two 7 in. x 14 in. compound air locomotives were added to the up-to-date plant of this company during the year.

The Canadian-American C. & C. Co., Frank, shipped approximately 100,000 tons of coal and will begin the production of coke in 1910. The West Canadian Collieries was also affected by the strike and the output reduced over twenty per cent. A new compressor plant was installed at the Bellevue mine of this concern. The Alberta Ry. & Irrigation Co., Lethbridge, shipped nearly 3,000 tons per day, excepting through the strike; opened up No. 5 mine and equipped it with steel tipple, 3,384 cu. ft. compressor, etc. At the Royal mine a 14 in. x 22 in. compressor and 14½ in. x 20 in. hoist were installed, and an output of about 300 tons per day maintained. The Nicola Valley C. & C. Co., Merritt, kept up a good output and installed a new air compressor plant, to be used for operating coal cutters, engines, etc.

So it will be seen despite the strike the coal output this year will be a good one and several new substantial mines have been opened up and equipped with modern machinery, ready for a heavy production in 1910.

In the Kamloops copper camp, a little work was done on three of the leading properties; and the B.C. Copper Co. bonded 33 claims on which it is expected development will be begun in 1910.

On the Coast the mines have not prospered as they should have and mismanagement is blamed for a lot of trouble. The Tyee Copper Co. is reported in considerable debt. The Vancouver Island coal properties have made a big production and the South Wellington mines have entered the market.

In the Portland Canal district the Red Cliff has ordered an air compressor, boilers, and mining plant, and will be a shipper in 1910. The Stewart and Portland Canal M. Co. properties are showing up well and will install plants in the Spring. The Consolidated M. & S. Co. of Canada has secured the Ikeda copper property, Queen Charlotte Island; the Granby Consolidated M. S. & P. Co. is interested in the contact group, in the same district and it is rumoured that the Le Roi and Le Roi 2, Ltd., are negotiating for copper claims of a promising character in the island mining districts, and will likely operate on the Coast during the coming summer.

The second section of the G. T. P. Ry, is being built up the Skeena River toward Hazelton, within a radius of 100 miles of which place are to be found the promising Telkwa (copper-coal), Babine (silver-lead), and 9-mile mountain (silver-lead), mining districts. Extensive development was carried out in these districts during the past year. The country is rich in mineral wealth. The third section of the G. T. P. Ry. is building from Yellowhead pass, westward. The Provincial government is behind a move to aid the Canadian Northern railway in building from Vancouver to Yellowhead pass. The G. T. P. Ry. is planning a branch from near Yellowhead pass to Vancouver. These railways will open up a country rich beyond comprehension in mineral wealth, including the famous Cariboo gold district. The extension of the C. P. Ry. from Midway to Nicola and of the C. N. Ry. from Princeton to Vancouver, will give the boundary two outlets to the Coast within the next year or so.

The total mineral production in British Columbia during 1908 was $23,851,277 and there is little doubt but that these figures will be exceeded in 1909. The total recorded production from 1852 to 1908 was $323,377,559, in annual figures that have increased year by year, although there was a reduction in 1908. B. C. coal deposits

are among the most extensive in the world and work has hardly been begun on them; there are big iron deposits awaiting development. The province still contains practically 300,000 miles of unprospected territory.

There is now a movement to better the zinc mining industry here, one thing asked being higher duty on zinc manufactures entering Canada, tending to encourage Canadian manufacture of zinc. The revision is upward and the consumer will have to pay for it. It seems to rest upon the United States, being the larger manufacturing country, to start reciprocity between the two countries. Of course, this is a question that can be argued from many a different point of view, but from that of a miner, in the final analysis, the boundary line, the tariff wall, red tape, etc., are a costly and inconvenient necessity (?) and it would seem more desirable to work toward reciprocity than away from it.

As far as the coal fields are concerned, reciprocity with the United States would no doubt be beneficial if they had more complete railway connection with that country, independent of existing roads; but until such time as this is the case, the main competition is with coal shipped in via the Great Lakes.

To sum up, it will be seen that the ore shipments from the boundary and Sheep Creek districts have increased, while the Rossland shipments have dropped; the net increase running over 100,000 tons. The coal fields will just about equal, or slightly surpass, the shipments of 1908, but have made unprecedented progress in the way of development and preparation for future work. Railway development has been all that could be asked for. The Portland Canal, Queen Charlotte Islands and Rabine-Telkwa districts have received the attention that is due them from the mining interests and much development work done. Taking everything into consideration, the production has been conservative and the work progressive and along the lines of good mining practice. The industry will show a far better balance sheet than was that for 1908 and another stone has been built into the foundation that is to support the better things to come in 1910 and in other years that are yet enveloped in the womb of time.

A PRIMER ON EXPLOSIVES.

The United States Geological Survey is about to issue a "Primer on Explosives" as an aid to the coal miner in particular and also to all who handle explosives. J. A. Holmes, expert in charge of the mine accidents investigations of the Survey, gives the purpose of the primer in the following words: "Of the common causes of the larger mine accidents, such as the falls of roof and coal, gas and dust explosions, mine fires, and the misuse of explosives, all of which are often closely related, each must be studied and fought in a manner peculiar to itself. The last mentioned—the misuse of black powder and other explosives—is sometimes considered the least important of these causes of mine accidents; but its importance is much greater than the statistics indicate, for the reason that this misuse of explosives may itself be the cause of many of the mine fires, gas or dust explosions, or falls of roof, and thus be responsible for a death roll often credited to other causes.

"The use of explosives is increasing both in quantity and in the variety of purposes to which they are applied. They are now made at no less than 150 plants in different parts of the United States, and the annual product approaches 500,000,000 pounds. Of all this material there is no such thing as a safe or safety explosive when in the hands of a careless or ignorant person. This statement is true whether considered in connection with the transportation or use of these explosives in mining. In addition to the large losses of life and property resulting from an improper use of explosives in mining, the recent statistics of the Railway Bureau for the Safe Transportation of Explosives have shown more than 400 persons killed or injured and over $2,000,000 worth of property destroyed from accidents from this source. The fact that through co-operative effort under the wise supervision of this bureau during the three years of its existence these losses have been reduced to almost nothing should encourage the hope that similar co-operative effort may likewise greatly reduce losses of life and property from the use of explosives in mining.

"This little book on explosives is published in the hope that it may aid in accomplishing this purpose. The aim has been to tell what explosives are and how they should be handled with a view toward greater safety, and to do this in language free from unnecessary technicalities. It has been prepared by Charles E. Munroe, explosives expert, and Clarence Hall, explosives engineer, of the Technologic branch of the United States Geological Survey. It has been revised in the light of suggestions made by the mining engineers associated with the Survey, by several mine managers, by the experts associated with the manufacture of explosives, and by Col. B. W. Dunn, Chief of the Bureau for the Safe Transportation of Explosives.

"Much of the information for this primer has been obtained from experiments conducted at the Mine Accidents station of the United States Geological Survey at Pittsburg, authorized by Congress, May, 1908, for investigations as to the 'causes of mine explosions.' These investigations have shown the recent development of a new type of quick flame explosives designated as 'Permissible Explosives,' which can be used with greater safety than black powder in mines where gas or inflammable dust exists under conditions indicative of danger, for the reason that the flame from the explosion of black powder lasts from 1,000 to 4,000 times as long as the flame from those newer explosives and is therefore more likely to ignite the gas or dust in these mines.

"Lists of permissible explosives were issued by the Geological Survey on May 15, and October 1st, of the present year, the latter list containing the names of thirty-one explosives, and with these lists is to be found a statement of the conditions under which these explosives have been selected from a larger number presented for examination. There are also in course of publication, and soon to be issued, bulletins dealing with other phases of the subject, such as methods and results of using permissible explosives in coal mining operations, the results of Tests of Explosives, and concerning the dust problem in coal mining.

"The large death roll of American mines is an oft recurring appeal to the miner and the management that they co-operate in every possible effort for greater safety. It may never be possible under conditions such as exist to-day to prevent mine accidents. Little may be accomplished in that direction by either the operators or miners working alone, but experience in all countries shows that through the hearty, determined co-operation of the two, these accidents may be greatly reduced."

THE EXTENSION EXPLOSION

Written for the Canadian Mining Journal by E. Jacobs.

An explosion which resulted in the loss of 32 lives took place on the morning of October 5th in No. 2 mine of the Wellington Colliery Company's Extension colliery, situated about ten miles from the town of Ladysmith, Vancouver Island, British Columbia. An exhaustive enquiry, extending over eight days was held, with the object of ascertaining the cause of the disaster. The Provincial Government secured the services of Mr. James Ashworth, a well-known English coal mining engineer, to give expert testimony, and was represented as well by Mr. Wm. Fleet Robertson, Provincial Mineralogist; Mr. F. H. Shepherd, Chief Inspector of Mines; Mr. Archibald Dick, Inspector of Mines for the Coast District, and by counsel. The Wellington Colliery Company also had counsel in attendance, while Messrs. J. H. Hawthornthwaite and Parker Williams took part in the enquiry on behalf of the miners.

During the enquiry a mass of evidence was taken. A brief summary of that given by Mr. Andrew Bryden, colliery manager at Extension; Mr. Alexander Shaw, overman at the mine in which the explosion occurred; Mr. F. F. Shepherd, Mr. W. F. Robertson and Mr. Jas. Ashworth follows, also the finding of the coroner's jury:—

Mr. Shaw deposed that at the time the explosion took place he was in the mine, on the slope, accompanied by a fireman. This was about 8.45 o'clock on the morning of October 5th. He felt at first as if the air had been taken completely from him. As no gas had been reported in No. 2 mine that morning, he could not understand what had occurred. He and the fireman at once went into some of the mine workings to investigate but were soon met by afterdamp. After going back they entered the counter level, and eventually found some of the miners, whom they directed out to the slope. He worked in the mine until 3 p.m.; meanwhile it had been fairly well determined where the trouble had occurred. After half an hour's respite he returned to the mine, but could not stand further effort in the mine, so left it, Mr. Andrew Bryden remaining in charge of operations. Mr. Shaw was submitted to a long cross-examination.

Mr. Andrew Bryden was also closely cross-questioned. In the course of his evidence he told of his investigations in company with Inspectors Shepherd and Dick, and Mr. Thos Graham, general superintendent of the Western Fuel Company, Nanaimo. In all there were probably 50 or 60 men working in the part of the mine where the explosion took place. Of these 32 were killed, 17 bodies having been recovered on Wednesday and the remainder early Thursday morning. He stated that a "cave" had occurred in the mine, and gave as his opinion of how the explosion had occurred as follows: "When the cave occurred there was a certain amount of gas, about half an inch or so, and the breaking of the coal during the caving process, created probably, a certain amount of dust. It may or may not have come in contact with a naked light, because, wherever a force may have struck a blind end, heat was generally there to a considerable extent. My reason for believing that the cave was the cause was because evidence of force extended from both ends of the cave and at two widely separated points. These blind ends are the only places where any scorchings are shown on the timbers."

Chief Inspector Shepherd gave very full evidence, first as to the preliminary investigations he and others made, and afterwards of the examination of the working places in the part of the mine where the cave and explosion occurred. Much detailed information of this examination was included in this testimony. The ventilation was dealt with and deductions were stated, these supported by indications of the direction of force and indications of flame. After stating that the mine was universally damp, as shown by hygroscopic observations mentioned in evidence, the probable condition of the atmosphere was thus indicated: "The evidence would tend to show that on the morning of the explosion the percentage of gas in the atmosphere of the mine was something below two per cent., but there was no evidence to show how much below. It might be conceded that marsh gas was present in the atmosphere of the mine that morning, but there was no body of standing gas or explosive gas reported that morning, nor more recently than August 14th." After quoting at length from an article on "Pressure as Affecting Explosive Conditions," and giving information on "Flame in Compressed Air Pipe," and other relevant matter, Mr. Shepherd continued: "I am of the opinion that such conditions obtained in the present case. A large cave had occurred, as shown, in No. 2½ level, extending along the level for more than 500 feet. This cave contains about 1,000 tons of fallen material, principally coal, which fell about seven feet. This represents a dynamic force of 7,000 tons, or a sudden displacement of 27,000 cubic feet of air, transmitting its velocity through the narrow drivages of the mine, which, upon meeting resistance at the dead ends, or sul de sacs of the mine, created a compression of the mine atmosphere, which converted the partly charged atmosphere, which under other circumstances, would not be considered dangerous, into an explosive condition. * * * The character of the explosion was of low intensity, which fact was, in my opinion, due to the absence of contributing factors, such as coal dust, to the damp condition of the mine, and the large area into which the explosion could take place." Mr. Shepherd was submitted to a long cross-examination by Mr. Hawthornthwaite.

Mr. W. F. Robertson, Provincial Mineralogist, corroborated the evidence of Mr. Shepherd regarding the condition of the working faces and, generally other conditions stated by the Chief Inspector of Mines. In his opinion the cause of the explosion was directly connected with the cave in No. 2½ level. The cave, he thought, occurred before the explosion, as there are none of the timbers left that show any evidence of heat in any shape. All the indications point to the explosion following. Dust blown on the top of the cave would indicate that the cave was down before the explosion occurred. The caved area is in the neighbourhood of 515 to 520 feet. There is no doubt in his mind that, by evidence given, previous to October 5th there had been no sagging or weighing on the timbers. He

Fig. 1.

Fig. 2.

SCENES AT EXTENSION COLLIERY

went on top of the cave and examined it very carefully and found a geological condition which, to a considerable extent, accounted for the suddenness of the caving. In this particular part of the roof there is a roll. In this cave it does not come up regularly; it commences to steepen at this point, and gradually increases in pitch until it takes a sudden roll, and seems to extend the whole length of the cave. It seems to have been a coincidence that the roll follows the level right along. Much other testimony was also given by Mr. Robertson.

Mr. James Ashworth, mining engineer, said that he was one sent by the Department of Mines to give expert testimony with regard to this explosion. He corroborated Mr. Shepherd's evidence in regard to the conditions of the faces of each stall and the positions of the different bodies found. He had seen, though, in one place, a hole and evidence of a badly blown out shot. After going into some detail as to conditions, he stated that the force which came along with the cave was followed by the fall of the roof, which brought down gas, and a man having a naked light the gas was ignited at a point he indicated. He was of the opinion that the cave occurred before the explosion. Dust was deposited on the top of the cave after the explosion.

At the request of Chief Inspector Shepherd, the coroner appointed two competent miners to investigate the place where Mr. Ashworth considered there was evidence of a blown put shot, but their testimony did not agree with that of the expert engineer.

After a lengthy consideration of the evidence, the coroners jury returned the following verdict:

"We, the jury empanelled to enquire into the cause of the explosion which took place in No. 2 Extension mine on October 5th, 1909, have come to the conclusion, after investigating the evidence of the different sworn witnesses, that the explosion was caused by the cave in No. 2½ level. Gas being present in its atmosphere, gas and dust being liberated by the cave, the sudden displacement of the air creating the compression, causing the partly charged atmosphere to become dangerous, and coming in contact with naked lights, exploded.

"Taking into consideration the unnatural and faulty conditions of the roof of this particular cave, and in view of the fact of no evidence to show bad timbering, we can in no way hold the company responsible, and therefore exonerate the company from criminal negligence.

Recommendations.

"(1) Taking into consideration the volume of work entailed in this particular department, and after taking from the statements of the Chief Inspector of Mines, and evidence in general, we are of opinion that the Coast District, being so large, it is impossible to make as thorough or systematic inspection as is absolutely necessary. We therefore recommend that the staff be increased.

"(2) That Rule 9a, Sec. 1, Coal Mines Regulation Act, be strictly enforced.

"(3) That every collier in British Columbia be compelled to equip its mines with up-to-date oxygen life-saving apparatus.

"(4) That where safety lamps are necessary, only re-lighting lamps of the Wolff principle be used.

"(5) That the maps of the mines be extended and kept up-to-date, and that index hand boards be placed in conspicuous places in different parts of the mines, showing the nearest way to the face, and that the management see that the men are instructed regarding them.

"(6) That greater precautionary measures be taken by the Inspector of Mines when gas of approximately 2 per cent. exists.

"(7) That coroner's juries, in cases where enquiries extend over one day, should be reasonably compensated. This enquiry having lasted eight days, we respectfully petition the Minister of Mines to consider our case, and compensate us accordingly."

"William G. Fraser, Foreman."

WOLFRAM MINING AND SMELTING CO., LTD.

Figures adduced at a shareholders' meeting of the above company are instructive. During July and August the company's mines produced 40 tons of tungsten concentrates, which sold at 28 shillings per unit. The ore mined ranges in tungsten contents from 1.7 per cent. to 2.2 per cent., which, apparently, is considered quite satisfactory. A very ready market is found for the mineral, despite current belief to the contrary.

OUR LONDON LETTER

British Miners and Mining Royalties in the General Election—Heavy Gravitation Stamp Development on the Rand—Powerful Three-throw Ram Pumps for Mine Draining in New Zealand—English Views on the Reverberatory Practice in Mexico—Copper Position and Rumours—Lead Prospects and a Canadian Proposal—Big British Zinc Plant Described—Successful Vacuum Process in Cornish Mine.

Special Correspondence to the Canadian Mining Journal.

The miners of Great Britain, organized, as they are, into trade union associations in each county and then into a National Federation, are proposing to take a big part in the general election which is looked forward to in January. Besides the ordinary Labour programme, they specifically ask for a Ministry of Mines, and are in favour of the minerals and mines of the country being under and managed by the state. As a matter of more practical politics, they ask for the legislative enactment of a minimum daily wage of $2 per day for miners. At the present time they say there are thousands of miners working in this country for $1.25, 75 cents and even 50 cents per day.

In the new taxes contained in the budget which has been thrown out by the House of Lords and which has therefore brought about this general election, there was a tax on mining rents and royalties coming as a result of the general taxes on land values. Mining royalties consist of royalties on each ton produced, practically a dead rent for the protection of the rent owner, with an accompanying compensating system of "shorts" for the protection of the mine owner, and of way-leaves above and below ground. Besides coal, they are charged upon other minerals, but coal is by far the most important.

The royalties and way-leaves on coal amount to about $21,000,000 per annum, while all other metals and ores only pay about $4,000,000 per annum. Upon coal these royalty charges vary in different coalfields from a minimum of 5 cents per ton in Northumberland and Durham to a maximum of 30 cents per ton in West Scotland. The average in each district varies from 6 cents per ton in the Forest of Dean, South Wales, to 14 cents per ton in West Scotland, this showing that mining royalties are not so much a tax as a rent for superior advantages of seam, situation, or both.

It is held by supporters of royalties that all that can be said to enter into the cost of coal is the minimum royalty of 6 cents per ton on the Forest of Dean. It is a well-known fact that coal owners would rather pay 60 cents per ton royalty for some mines than be compelled to work others without royalty.

As a perfect illustration of the way in which the royalty system has grown up in this country, although it is now part and parcel of the ordinary business results of our civilization, take the case of the coal mines held by the Dowlais Company. In the year 1748 the then Marquis of Bute leased to Anthony Brown eight miles of mineral property in Merthyr, Glamorganshire, for 99 years at $500 royalty per year. Some years later this lease was transferred to the Dowlais Company, which held it until its expiry in 1848. The Dowlais Company then re-leased it from the Butes at $100,000 per year, and apparently considered that even at that hugely enhanced figure they had struck a good bargain.

Popular opinion seems to have attached rather more importance to the question of mining rents and royalties than the subject deserves. Undoubtedly mining rents and royalties are a nuisance to the persons who have to pay them, and the total sums paid, as we have shown, are considerable. But these promises are by no means sufficient to authorize the popular conclusion that the system of royalties is an oppressive tax on one of the staple industries of the kingdom.

The Liberal Government proposed to put an annual tax of 5 per cent. on the rental value of all rights to work minerals, and on all mineral way-leaves, excluding brick, clay and earth, sand, chalk, limestone and gravel. The financial result of the mineral rights duty was estimated by Mr. Lloyd-George to add $875,000 a year to the revenue. It was urged by the Government that this was not a tax on minerals, but a tax on the landlords, who make a levy on the mine owners for the right to work minerals. The Government regards mining royalties as a tax on the springs of national wealth.

As the budget forms the real fighting centre of the election, it is interesting to point out these mineral and mining factors.

At the opening meeting of the winter session of the Institution of Mining and Metallurgy, Mr. W. A. Caldecott, discussing the development of the heavy gravitation stamps, said that the history of ore crushing by means of gravitation stamps showed a progressive increase in their weight and in corresponding efficiency. He had carried out a series of milling tests at the Knights Deep battery, which was equipped with stamps weighing 1,350 pounds when new, with the object of discovering some means whereby stamp-milling efficiency could be increased. Encouraged by the results of these and many other tests, including a duty of approximately 6½ tons through 1,500-mesh screening with stamps weighted up to 1,622 pounds, he recommended that the next stamps erected by the Consolidated Goldfield Companies should have a weight of 1,550 pounds each when new. Such a departure excited much adverse comment among experienced millmen generally, but the mills were satisfactorily at work today after periods of service ranging up to three years.

In accordance with the present changed state of professional opinion, he said, all Rand batteries lately erected or designed had stamps of a weight not long ago deemed extravagant, and, aided by the installation of tube mills, stamp duties of eight tons were now as common as those of four tons a few years ago. In order to employ heavy gravitation stamps to full advantage, it was absolutely necessary that a uniform speed should be maintained. That, in spite of certain obvious disadvantages, they still held their own was probably due to the fact that pneumatic and steam stamps as hitherto designed had proved wasteful of power and liable to derangement under the vibrations and shocks inevitable during crushing.

A serious effort was, however, now being made to utilize a new type of Holman pneumatic stamp at New

Kleinfontein mill. The day of the stamp as a unit of crushing capacity had passed away. The unit of the present basis was the tonnage per month or per day. The future limit of stamp weight was difficult to foretell, but it would probably be determined more by the mechanical considerations involved, as in the cam system of lifting, than by any decreased relative efficiency as a device for pulverizing ore. The advantages of heavy stamps as compared with lighter ones were: Reduction of the initial capital expenditure in erecting 200 stamps at 1,750 pounds with accessories, in place of 270 stamps at 1,250 pounds each; reduction in size of mill building, almost proportionate to the less number of stamps, 30 per cent. less shafting, belts, and other moving parts to maintain, and 30 per cent. less labour required.

Messrs. Hathorn, Davey & Co., of Leeds, have constructed for the Waihi Gold Mining Company of New Zealand two sets of powerful three-throw ram pumps for mine draining purposes. Each pump is capable of raising 1,500 gallons of water per minute, against a head of 800 feet, and has rams 12 inches in diameter by 2 feet 6 inches stroke. They are driven by variable speed, direct-current, 500-volt motors of 420 b.h.p., which have a speed variation of 50 per cent. The power is transmitted from the motor to both ends of the crankshaft through two stages of machine-cut gearing. The slides are loose and independent, so that should they be damaged by a fall of the mine roof or from any other cause, they could be readily replaced. This type also allows of easy adjustment. The bed-plate is built up in sections for easy lowering into the mine.

The water valves comprise a nest of small-sized valves, allowing ample waterway, which can be easily taken out for examination or repair. They are mounted on a valve-plate adjustable externally, and are of the makers' improved type for dealing with gritty mine water. Each valve is of gunmetal, with a leather joint ring. There is a vacuum vessel directly below each pump, and an air vessel immediately above. A large by-pass is provided in order to reduce the load on the motor at starting. This, of course, can be closed as soon as the pump is in motion. There is a bearing between and outside each crank, and each bearing is adjustable in four directions. In addition to the 12-inch rams, a separate set of interchangeable rams is provided. These are 10 inches in diameter to enable the pumps to deal with a smaller quantity of water against a correspondingly higher head, if it should be necessary to move them to a lower position in the mine.

Mr. L. D. Ricketts has been speaking in this country on recent developments, and especially experiments in reverberatory practice at Cananea, Mexico. He tells us how for the purpose of matting their flue dust from the blast furnaces and roasted concentrates a very large reverberatory furnace was installed in 1896, but this 100-foot structure had to be closed down until recently owing to the difficulty of firing with ordinary fuel. Powdered coal was tried unsuccessfully, and now finally oil is being used with special burners, and over the 72,000 tons of material smelted in the last eighteen months a very considerable saving has been effected in costs. Even the $1.68 per ton now ruling is thought to be capable of reduction in three ways: (a) Decreasing the excessive stack temperature at present existing, although three Stirling boilers are used to absorb waste heat; (b) decreasing cost of material and labour for repairs; (c) increasing the average daily capacity by fewer delays for repairs, and by decreasing the flue dust produced in the blast furnaces and increasing the amount of calcines from the McDougal roasting furnaces.

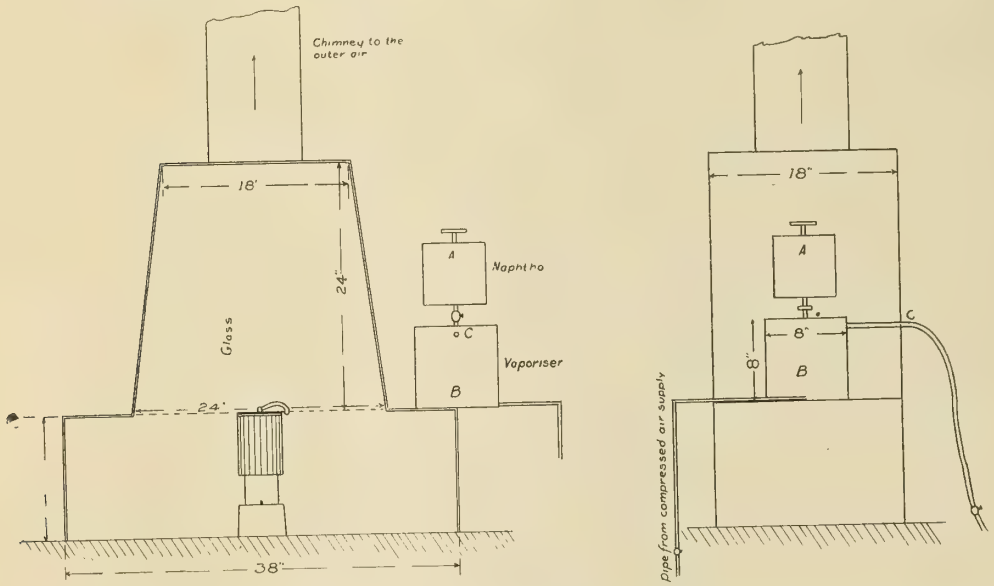
Mr. Ricketts expressed the belief that the introduction of large reverberatories would aid most copper smelters, as found at Cananea, by admirably seconding the blast furnace practice, in using up the flue dust and fine concentrates at low cost, and by removing the fine material from the charge, lessen the blast furnace cost also.

The latest copper market movements here show a great curtailment of speculative operations compared with the huge turnover recorded recently. The statistical position on this side has again grown appreciably worse, and renewed selling pressure has become manifest. The statistics for the second half of November disclosed a fresh notable increase in the European visible supply. Practically no disposition is shown to force forward sales.

Circumstantial reports have been circulated here to the effect that a London offer of $25,000,000 has been made for the property of the Arizona Copper Company in Edinburgh on behalf of the American capitalists who are behind the negotiations for the great copper combine. The chairman and another director of the Arizona Copper Company have sailed for New York, and no official information is obtainable. The Arizona has an ordinary share capital of $1,899,870, and its output is 17,000 tons of copper per annum.

The lead market on this side, like that devoted to copper, benefits by the great development of electrical enterprises. Unlike the more important metal, however, lead has not a serious overproduction and generally unstable statistical condition to contend against. Over here stocks are not unduly large, and the arrivals are well within the capacity of the market. Many lead mines sell their output at average prices for a year ahead; hence when the Convention came into existence some months ago the output of these for this year was already virtually disposed of. A few weeks ago the Convention's brokers bought freely in London, raising the price of prompt delivery from about $64 to $67, selling heavily at the same time to consumers everywhere. Contracts for 1910 will shortly be arranged, and the course of events in this connection may be interesting.

Messrs. Lindgens & Sohne and Messrs. Bergman & Simons, of Mulheim, Germany, have purchased from the Lead Products Syndicate, of Liverpool, Barton's patents for manufacturing litharge and red lead for Germany, Luxemburg, Austria, Russia, France, Italy, Sweden, Norway and Denmark. A company is in course of formation to work the Canadian patents in the neighbourhood of Niagara, where cheap electrical power is available. It is also intended to establish factories, as soon as possible, in the United States and Australia, and probably in Japan. In Barton's process the finished litharge is produced in one operation from metallic lead, at a temperature far below the point of fusion. No sifting, grinding or after-treatment is required.



The Central Zinc Company has organized a big plant at Seaton Carew, West Hartlepool, which has a smelting capacity of about 35,000 tons of zinc blende per annum, which should produce about 10,000 tons of spelter. This company is a subsidiary of the Sulphide Corporation, formed to treat the Broken Hill Central mine's zinc blende. It was formed in 1906, since which time extensive experiments have been carried on prior

to the starting of the plant at West Carew in May, 1908. The distillation furnaces are of the recuperative type. The pottery is 315 feet long, the upper floor of which is constructed of reinforced concrete. The roasting furnace is steel-panelled, 105 feet long by 75 feet wide, and the distillation works are 415 feet long by 56 feet wide. All the latest developments for zinc blende treatment have been adopted.

For the past two years the Elmore vacuum process has been in operation at the Dolcoath mine on its complex ores, with the result that practically all the sulphides are removed as a concentrate almost free from tin, leaving the tin in the tailings, which is passed on to the usual water concentrating appliances for the recovery of the tin practically free from sulphides. Where tin ore contains only copper sulphides, the vacuum process produces a high-grade copper concentrate readily salable to the copper smelters. This gets rid of the copper impurity, and at the same time purifies the tin ore so as to make it valuable to the smelter. Following this success, I understand, this process is about to be applied to similar ores found in two other widely separated parts of the world, namely, the Straits Settlements and South Africa.

TESTING SAFETY LAMPS

Written for the Canadian Mini ng Journal by James Ashworth.

The British Columbia Coal Mines Regulation Act of 1897, Chapter 138, Rule 8-A, enacts that in addition to the requirements of Rule 8, every safety lamp so in use shall be tested in an explosive mixture of gas and tar at least once every week. This rule came into force on the 1st of January, 1905, but by the written consent of the Minister of Mines, a further reasonable time might be allowed in which to prepare such testing of lamps. Up to quite recently it has not been possible for outlying collieries, where lighting gas is not available, to make this test more than once a week. The required test, where lighting gas is available, does not entail any very great or practicable difficulty, but where the gas has been specially prepared, the process of testing has been very tedious and expensive. The onerous nature of this rule became accentuated when the Inspector of Mines decided that a weekly test did not entirely fulfil the requirements of Rule 8-A. The rule further enacts that "should the glass, washers, gauze or any essential part of such lamp have been renewed, or removed and replaced after the lamp has been so tested, then such lamp shall be again tested, and any lamp which shall be shown by such tests to be imperfect or inefficient, shall not be allowed in any mine to which this Act applies, until such imperfection or inefficiency shall have been remedied and the lamp shall have passed a satisfactory test. And every colliery so using safety lamps shall be equipped with apparatus for making such tests of some such form as shall be approved of by the Minister of Mines, and such tests shall be of such a character as may from time to time be approved by the Minister of Mines.

It is quite clear that no double gauze lamp could be properly cleaned without the removal of all the parts from the lamp case, and, therefore, the literal observance of this rule means that the lamps must be tested daily. Although this rule came into operation in January, 1905, its observance has not been precisely insisted upon until recently, because of the want of a suitable arrangement to expeditiously pass the safety lamps through a practical test. Some firms using the Wolff Spirit Lamp adopted an arrangement consisting of an air tank, a gas generator and a gas cylinder, such as supplied by the Wolff Company. This apparatus has a tank similar to a gasometer filled with air, and this air is forced through a rubber tube into the gas generator, which is a sheet iron box divided in the inside into several horizontal compartments, on which absorbent cotton is placed. The shelves forming the compartments are slightly inclined, so that the excess of naptha (76°) on one shelf may run down on to the one below. The naptha is placed in a glass reservoir fixed on the top of the generator, and the supply of naptha is regulated by a tap. Air from the tank being forced into the bottom of the generator and zigzagged by the shelves, becomes charged with any desired percentage of gas.

The explosive mixture thus produced is then passed through a coiled pipe, perforated on its inner side and surrounded by a metal case, having a pane of glass on one side, through which the action of the mixture on the safety lamp placed within the coil can be observed. In the event of the mixture containing too much gas, more air can be admitted through a shutter arrangement at the base of the testing box. The main objection to this arrangement is that the process is very slow, and the man operating the test is exposed to the fumes of the gas.

The British Columbia Government, through its Chief Inspector, advised the coal operators that they were expected to observe the law, and must devise an apparatus which, if satisfactory, would be approved by the Minister of Mines. The writer having, therefore, taken the matter in hand, designed the arrangement shown by the accompanying drawings. Thus there is a box made of sheet iron, the bottom part where the lamp is shown being open on the front side, and the upper part enclosed by a glass plate, whilst entirely protected from the gas fumes. A constant current of air passing through the case goes right out to the open air up the chimney. Ten or more lamps are placed in the box at once, and after the cylindrical vessel "A" has been filled with naptha, the spirit is allowed to run through into the vaporizer "B," where there are shelves covered with cotton wool, so placed as to zigzag the compressed air, which is regulated by a tap and admitted at the bottom, as in the Wolff arrangement The operator then takes the flexible tube "C" into his hands, and after opening the tap applies the gas to the top or bottom part of the lamp, as he may desire, and the explosive mixture of gas and air is thus forced into the lamp. If the gauzes are sound the lamp may be extinguished, but if faulty, the gas issuing from the tube is at once ignited, and the lamp is then known to be dangerous.

These tests can be made very quickly and economically, and being in full accord with the Coal Mines Regulation Act, will doubtless receive the approval of the Minister of Mines very shortly.

In conclusion the writer hopes that this apparatus may be of use to other mining men who have had, or may have a similar difficulty to face.

THE UNITED MINE WORKERS IN NOVA SCOTIA DURING 1909

(By our Glace Bay Correspondent.)

The resume of conditions attending the coal-mining industry of Nova Scotia during the year 1908 which appeared in the Canadian Mining Journal of 15th January 1909, recorded a steady progress in all things connected therewith, and this year stood out as one marked by unusual advances in tonnage, legislation, technical education, and precautions for safety. The year just past unfortunately presents a very different aspect. It has been a year of stagnation and reaction. At the end of the 1908 resume it was stated that: "In any case there is no justification for any glowing forecasts of the progress of the coal industry in 1909," but the most pessimistic of men could hardly have foreseen that the tonnage of coal mined for the year would be less than in any year since 1903. At the date of writing it is not possible to compile any correct statistics of tonnage to compare with previous years, but it is within the mark to say that the coal production of Nova Scotia for 1909 will be almost one million tons less than it would have been had the delegates of the United Mine Workers of America not been able to bring about the several strikes which have marked the summer. The strike situation has so dominated the year's work, that its history must be to a large extent a retrospect of the U. M. W. A. trouble.

It has long been the policy of the leaders of the United Mine Workers of America to obtain control of all the coal workers in Canada, a policy that is expressed in the name of the organization. The miners, organizations which existed previous to the formation of the United Mine Workers of America, were the "American Miners' Association," the "Workingmen's Benevolent Association," and the "Miners' National Association." When these organizations were eventually superseded by the United Mine Workers of America, there can be no doubt that the territorial limitation which was inferred from such a title as the "Miners' National Association," occurred to the leaders of the U. M. W. A., and the title which they chose for the new organization is probably as wide and comprehensive a description of the ultimate aims of this Union as could have been devised. These aims are doubtless the absolute domination of all coal mines in the American continent from the headquarters of this union in the United States. It is particularly the desire of this organization to control the mine workers of Nova Scotia in order to consolidate their powers througout the whole of the great coal field which occupies the eastern half of North America.

Since 1904 the leaders of the U. M. W. A. have had agents actively working in Nova Scotia. In September 1905, a district president of the U. M. W. A. addressed the Grand Council of the Provincial Workmen's Association of Nova Scotia in Halifax, and at the Annual Convention of the U. M. W. A. early in 1906 the Dominion Coal Company and the P. W. A. were fiercely assailed for having entered into the Three Years Contract, particular exception being taken to a clause in that Contract which provided that "The employees shall not attempt to restrict the sale of the coal of the Company to any person, firm or corporation." This clause was objected to because it precluded a sympathetic strike by the Dominion Coal Company's workmen.

At the expiration of the Three Years Contract, the P. W. A. and the Dominion Coal Company were unable to agree upon new terms, and a conciliation board was called for by the workmen. The award of this board was accepted by both parties, and in March 1908 a contract was signed accepting the terms of the award until the end of 1909. After the signing of this contract the leaders of the U. M. W. A. grew very active and

commenced to organize locals of the American union, and vigorously attacked the Grand Officers of the P. W. A, chiefly by instituting a series of vexatious legal actions, in all of which the U. M. W. A. were nonsuited by the Courts. This fratricidal warfare did not interest the coal companies until at the beginning of 1909 the U. M. W. A. commenced to initiate into membership certain minor colliery officials of the Dominion Coal Company, who were forthwith discharged, in accordance with a long standing rule that no official who has the direction of other men can belong to a labour union. The constitution of the U. M. W. A. provides that all persons employed at collieries where that union is in control shall be members of the Union, with the single exception of the "Manager and the top-boss," and the "closed shop" in its most intolerable shape marks the U. M. W. A. wherever it is in power.

The U. M. W. A. workmen of the Dominion Coal Company applied for a Board of Conciliation, alleging discrimination against members of the U. M. W. A. as such. The award of the board found that no discrimination had occurred, and that there was no ground for any of the charges made by the representatives of the U. M. W. A. At the mines of other companies in Nova Scotia, Conciliation boards were called by the U. M. W. on various pretexts; namely, at Sydney Mines and Springhill. The award of the board in each case was adverse to the U. M. W. A. After the sitting of the various boards, various members of the International Executive of the U.M.W.A. came to Nova Scotia and paid organizers were put in the field throughout the mining districts of the province. These men spent money with great freedom throughout the first six months of 1909, and they prepared the ground for future events in a skillful manner, showing a considerable knowledge of human nature and the methods of bringing about labour troubles. The coal trade in the early part of this year was in an exceedingly slack condition and there was a shortage of work. The officers of the U. M. W. A. dispensed a large amount of money in what was called "relief" and put themselves into touch with the various religious and political organizations; they made especial endeavours to win the good-will of the wives and families of the miners through the medium of ladies related to the U. M. W. A. organizers. The U. M. W. A. leaders appeared to identify themselves with every form of advanced social legislation; they particularly laid themselves out to influence the men from Great Britain and various parts of Europe, and they appropriated as part of the platform of the U. M. W. A. most of the labour and social legislation which has been slowly evolved by the legislatures of the old world. Not a word was spoken about the possibilities of a strike, and the propaganda of this American organization was so designed that it was hailed as a new gospel and, unconsciously, a great number of people became enthused with it who were in absolute ignorance of the ultimate aims of the campaign—aims which to-day are unfortunately only too apparent.

The campaign among the general public was such as we have outlined, but among the workmen the bait held out was more specific, including, as it did, the eight hour day, a large increase in wages, reduction of house rent and the price of workmen's coal, certain minimum wages for certain classes at work, the collection of dues through the company's office, the establishment of a completely "closed shop," and the utter humiliation of the leaders of the Provincial Workmen's Association, accompanied by the extinction of the local union. The men were given to understand that all these things would automatically follow recognition of the U. M. W. A., but until the last moment these men did not think that a strike would be called.

At the end of June a circular letter was dispatched to all the operators in Nova Scotia, demanding their attendance at a joint convention with leaders of the United Mine Workers at Sydney. This demand was, of course, entirely ignored by every coal company. At the beginning of July the Dominion Coal Company was notified that unless it met leaders of the U. M. W. "To discuss the matters of difference between your company and ourselves" a strike would be called. By purposely omitting to make any specific demands upon the company in their ultimatum, the U. M. W. endeavoured to escape the penalties of the Industrial Disputes Act for calling a strike without legal notice.

The day before the strike local president of the U. M. W. A. gave an interview to the press, stating that his organization controlled 95 per cent. of the Coal Company's workmen, and there can be no doubt that the men who went on strike took this statement as being correct. Many of the men who went on strike had been members of the U. M. W. A. for a few days only, having been induced to join that union by a combination of coercion, cajolery and deceit, and when these men joined the U. M. W. locals they had not the slightest intention of going on strike. They were induced to strike by a series of falsehoods, and they have been kept out on strike by falsehood invented after falsehood. A newspaper was started by the help of U. M. W. funds to keep alive and foster the agitation, and this paper has been of great assistance to the leaders by disseminating among the strikers the falsehoods which have been necessary to prolong the abstention from work. This was rendered the easier to arrange as those strikers who could read English were counselled not to read those newspapers which disagreed with the position of the U. M. W. The agents of the U. M. W. have carried on a persistent misrepresentation of the number of men at work and the output produced from the mines of the Coal Company, and even at this late date very few of the men on strike believe the output figures which are given out by the company. The unwitting foreigners have been shamefully deluded. They were assured that the strike could not last more than a few weeks, and were promised large rewards if they would come out. They were also told that when the strike was over, and the U. M. W. had won, their wages would be increased up to $6.00 and $9.00 per day. All through the strike violent attacks have been made on the personnel of the company's management, on H. M. Inspectors of Mines, on the Government, and on the magistracy and judiciary in their administration of the law. Lying reports were disseminated the world over regarding the condition of the mines underground, the rate of wages and the conditions of living on the surface. Bribes have been offered to men holding important positions in the company's employ to defect at critical moments, attempts were made to intercept letters and telegrams in transit, and many overt and illegal acts have been committed in secret, apart altogether from the open and violent intimidation which has been carried on under the direction of the leaders in Glace Bay, and the funds of the U. M. W. have been used without stint to defend members of that union who have broken the law.

An exceedingly large sum of money has been disbursed from the International treasury of the U. M. W. during this strike. It is not a labour trouble that has arisen out of intolerable grievances, for as yet the strik-

ers have not formulated a single grievance, but it was brought about by "malice aforethought" by the campaign of the trained organizers of the U. M. W., and it has been maintained by a lavish expenditure of union funds. It is a well-known fact that many of those who have drawn upon the funds of this union had no right to do so. Many men have been in receipt of strike allowance who had not worked in the mine for years, and there are men living on their own farms in Cape Breton who are drawing strike pay. In some parts of the island it has been a recurring subject for joking when the farmers from the country came into the mining towns to draw their strike pay.

The Deputy Minister of Labour's report on the U. M. W. A. situation stated that at Glace Bay the strike was practically broken, and that most of the strikers would be "surplus labour through the winter months." At Inverness he found the strike was never at any time an effective one, and at Springhill the situation has resolved itself into a deadlock. This summing up can hardly be improved upon. An interesting sidelight on the Glace Bay strike is that on the 14th of December, the date on which the U. M. W. A. members voted for the presidental election of that union, the output was over 11,000 tons, What this means is shown by a comparison with previous years. In December 1906 the average daily output was 8,500 tons, in the same month of 1907 and 1908, it was 10,800 and 7,000 tons respectively.

The operators of Nova Scotia opposed the coming of the U. M. W. consistently and from the first, and the reason is not far to seek. The U. M. W. has a record of the worst kind in the United States, and their operations have always been attended by violent breaches of the peace. It was feared the same results would follow in Nova Scotia, and the fear has been more than justified. We have also witnessed in Halifax the General Manager of a large coal company forced to testify on the witness stand to the price of coal in Montreal at the very time when large coal contracts are pending there, for which the keenest competition is going on between the American coal mines and our own. This gentleman was asked to disclose in public the very secrets which our American competitors are spending money to get, in order to underbid our Canadian business just sufficiently to get the orders. There seems something anomalous in a state of affairs which allows an unincorporated foreign union to prosecute our operators because it is suspected they have tried to prevent ruinous cut-throat competition, while at the same time this union is pouring American money into the Province which is being used to gain American domination of our coalfields. Our coal companies have been compelled to spend large amounts in protecting their properties against physical violence and incendiary fires, and some 5,000 men have had to suffer contumely and bodily danger from a body of men numbering less than 2,000, because the latter were incited by American strike-breeders, and defended by American money. As the law stands to-day every Canadian corporation is apparently at the mercy of any United States labour union which sees fit to send into our country its heralds of discord to spend money in engineering strikes, and we have no protection should these funds get into the hands of an ill-advised or foolish man, or should the power of calling strikes be given to men whose integrity is not unimpeachable. The records of many United States labour leaders are not such that Canadians can contemplate with equanimity their present unchecked powers in the Dominion. Our Canadian industries and our national labour organizations may justly ask that protection shall be given them from the marauding and irresponsible actions of International organizations controlled from the United States, and from the scenes of lawlessness and bloodshed for which these bodies have been responsible in the Dominion.

EXCHANGES.

The Mining World, December 4th, 1909.—Editorially The Mining World credits 113 United States mines and metallurgical works with $55,398,429 paid in dividends during the 11 months ending Nov. 30th, 1909. Fifteen Canadian companies, thirteen of which operate in Cobalt, paid during the same period $6,120,188 to shareholders. By a curious misprint Crown Reserve is rendered "Crown Point."

Economic Geology, October-November, 1909.—In an article "On the Origin of Petroleum," Mr. L. V. Dalton comes to the conclusion that the great majority of oils are derived from the decomposition during long ages at comparatively low temperatures of the fatty matters of plants and animals, the nitrogenous portions of both being eliminated by bacterial action soon after the death of the organism. The fats and oils from terrestrial fauna and flora may have taken part in petroleum formation; but the principal role must, from the nature of most petroliferous deposits, have been played by marine life.

We fear that Mr. Dalton's point of view is one-sided.

Mining Science, December 2nd, 1909.—"The Application of Steel to Mine Timbering" is the title of an article by R. B. Woodworth. Among the advantages claimed for steel is the matter of re-use. Isolated props are now very seldom withdrawn and are utterly worthless when the time comes for their replacement. In English mines steel roof supports have been taken out, turned and used 200 times over. Experience in the United States has corroborated this.

A curious peculiarity of the new ferro-titanium rails, which have been made experimentally in the United States for a little more than a year, is that they may be entirely free from titanium, and at most they contain but little. In this respect the "alloy" differs from all others. The properties of nickel-steel, for instance, depend upon the presence of a material percentage of nickel, and manganese-steel must have a carefully adjusted proportion of manganese, for the new metal, the steel is made in a convertor and blown in the usual way, when it receives a charge of titanium alloy. This is a product of the electric furnace, and is a mixture containing 10 to 15 per cent. of titanium and 5 to 7 per cent. of carbon, the remaining portion being iron. Each ton of steel receives a charge of about 8 pounds of 10 per cent. alloy, the effect being to increase the slag removed from the metal in the ladle, while the ingots are free from blow-holes. The titanium unless in excess of what is necessary to remove the impurities, all passes off in the slag. The treatment gives special durability to rails for curves, and at the Grand Central Station in New York an ordinary rail lost 3.03 pounds per yard in four months, while a titanium alloy rail of the same composition was worn away only 1.01 pounds per yard in six months. The few dollars increase per ton of Bessemer rails is expected to be much more than offset by added durability.

HIGH POWER DIRECT CURRENT CENTRIFUGAL MINING PUMPS

By Frank C. Perkins.

One of the most important installations connected with mines is undoubtedly the drainage plant, and the recent development of direct current machines for steam turbines service requiring dynamos of high speed and special design has resulted in the construction of similar machines to act as special high speed direct current motors for coupling two centrifugal pumps.

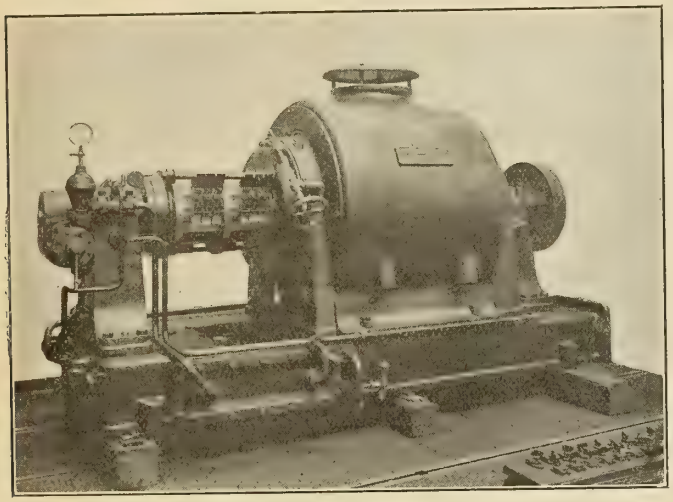


Fig. 1. Direct Current Motor for Driving a High Speed Centrifugal Pump of the Merles Mining Co.

The accompanying illustration (Fig. 1) shows a new Swiss direct current motor for coupling to a mining pump operating at a speed of 1,320 revolutions per minute.

In driving the same at full load, it develops 450 horse power and is operated on the 550-volt mining power circuit. Another similar electric centrifugal pump for mining service is shown in the accompanying illustration (Fig. 2), having a capacity of 55 horse power, normal rating, but being able to carry overloads continuously up to 75 horse power without injury. It runs at a speed of from 2,500 to 3,150 revolutions per minute, with a speed regulation of 50 per cent. up and 20 per cent. down.

These Swiss direct current high speed motors for mining pump service were designed and constructed at Baden, by Brown, Boveri & Co. The 500 horsepower motor operates at a speed of 2,600 revolutions per minute, and the 40 horse power drives the centrifugal pump at a speed of 4,000 revolutions per minute, while the largest electric direct current motor for pumping service has an output of 2,300 horse power working under a speed of 900 revolutions per minute.

Fig. 2. Direct Current Electric Mine Pump of 75 H.P. maximum capacity

These high speed Swiss direct current mine pump motors are provided with a series compensating winding as well as a shunt winding, and can operate over a wide range of speed with the help of a variable resistance in series with the latter.

It may be stated that forced lubrication is employed, the oil being forced continuously through the bearings by means of a pump worked from the motor shaft. The oil returns to the reservoir, where it is cooled by means of a water spiral and from which it is taken by the pump and fed to the bearings.

It is held that the principal advantage of this type of motor for the above class of work over the usual type of three-phase motor is the great speed variation obtainable without loss of efficiency when desired while otherwise the speed is constant, irrespective of the load. The efficiency of these machines is high and the ventilation in a similar manner to that employed for the turbo-dynamo. The air enters from underneath the leaves at the chimney-shaped opening at the top, the ends being completely enclosed, the machine being thus particularly adapted for use in mines.

The construction of the commutator is also the same as that employed for the turbo-dynamos, heavy shrinking rings being used, insulated from the commutator by means of solid mica the brushes remain fixed at all loads and speeds without sparking.

The hardening and strengthening influence of a minute proportion of some element in an alloy, which is a marvel and mystery of metallurgy, is not confined to the various steels. Arsenic is a hardly appreciable impurity of furnace copper, but it now appears that the electrolytic copper coming so generally into use is too pure for certain purposes. On the Prussian railways it has been noticed in recent years that the number of fractured locomotive staybolts was strangely increasing. Investigation shows that this has followed the increasing use of electrolytic copper, and that of 23 broken staybolts collected, 21 were of this metal, and only 2 of furnace copper. Of the electrolytic samples, only one contained arsenic, which was present in all furnace copper bolts tested. The high quality of copper containing traces of arsenic had been already recognized, and railways in Italy and the British Colonies specify 0.15 to 0.55 per cent. of arsenic as necessary in all copper bought.

Mr. H. H. Sutherland, formerly of Nova Scotia, recently disposed of several properties in the new Porcupine Gold District. The first sale was made to Mr. Noah Timmins, of Montreal. Another property, the Reamsbottom, was sold by Mr. Sutherland to a Montreal syndicate, and the Davison was acquired from him by a very wealthy Montreal investor who is already largely interested in Northern Ontario.

THE NORTH THOMPSON VALLEY, B.C.

By J. C. Gwillim.

(Continued from last issue.)

GEOLOGICAL AND MINERAL RESOURCES.

Concerning the geology and mineral resources of the district between Yellowhead Pass and Kamloops, several reports have been issued by the Canadian Geological Survey, but none of these gives much information of the central portion of the route along the upper North Thompson.

Dr. Dawson, in his Kamloops Map Sheet report of the years preceding 1890, covers the ground as far as the small coal field 50 miles north of Kamloops, and McEvoy, in his Report of 1898, covers the ground south of Yellowhead Pass to the Albreda summit, about 30 miles south of the "Cache." Between these mapped, examined areas is a stretch of over 150 miles, traversed in 1871 by Dr. Selwyn; but his report gives very little information beyond the occurrence throughout the district of mica schists and gneiss—an Archean series which he affiliates with the talcose micaceous schists of Old Cariboo, but which Dr. Dawson later describes as the Shuswap.

As far as known, the geology of the lower North Thompson, south of Raft River, is similar to that of Dr. Dawson's Shuswap sheet—a mixture of Archean gneiss, Cambrian schists, carboniferous cherts, and limestone, with a few small areas of greenstone, and Tertiary sedimentaries.

Some placer gold has been found on the bars of the river up to Clearwater junction, also on some of the tributaries. In 1901 a modern dredge, built by F. Satchill Clarke, of Vancouver, was operating at a point 12 miles above Kamloops; but the work was discontinued owing to the shallow nature of these bar deposits. Several fair showings of mineral in place have been made on Jamieson Creek, on Lewis Creek, and on Barriere River. Also at a point a little above Raft River some quartz and galena have been found. Galena, zinc blende, pyrites, and quartz with fair gold and silver values appear to constitute the prevailing ore. These are probably similar to the known occurrences about Adams and Stump Lakes eastwards and southwards.

With reference to the occurrences of mineral at these places, they seem to have been forgotten since Southern Kootenay came forward as a producer of metals. Many people may be astonished to learn that prior to 1890, or even as late as 1896, the deepest mine shaft in British Columbia was one of 400 feet at Stump Lake, 22 miles south of Kamloops. Some of the samples from this district are cited as carrying up to 6 ounces of gold and 90 ounces of silver; also several running $15 in gold with from 15 to 400 ounces of silver per ton.

Another promising district, according to Dr. Dawson, was Jamieson Creek, 15 miles up the North Thompson from Kamloops, with gold values from $11 to $22, and silver from 2 ounces to 34 ounces per ton. The quartz-galena ore from near Raft River assays: silver, 60 ozs.; Lead, 35%; gold $7 per ton.

From such occurrences there appears to be some promise of mineral development along the North Thompson, on its lower portion at least. Into this portion of the district drain several fairly large streams—such as Clearwater and Raft Rivers from the plateau country to the north-west; Lewis Creek, Barriere River, and Lost Creek from the eastwards. The Clearwater especially leads a long way into the district between the North Thompson and Quesnelle Lakes. Some placer gold has been reported from its upper waters, and good timber lands are abundant. All of these streams are clear, while the trunk stream, the North Thompson, is muddy with glacial waters derived from the much more mountainous country further north.

Beyond Raft River, at the head of boat navigation, a barrier of granitic and gneiss-mica schists crosses the country, and thence indefinitely, probably to the heads of Peace River, these crystalline Archean rocks form the first range west of the Rocky Mountains proper. The only mineral occurrences so far reported are some gold in quartz at Mad River; and various showings of white mica at the Big Bend on the Columbia, at High Bank, on the North Thompson, and at Canoe River and Mien Mountain near Tete Jaune Cache. Similar deposits were found far to the north-west on Finlay River by some of the Klondike gold-seekers on their way up by the Edmonton route.

The principal tributary of the North Thompson north of the sharp turn at the Raft River, is Blue River, coming in from the west. Looking up this rather straight, long low valley, one is impressed with a rapid change in topography on the northern side, the comparatively low, wooded mountains of the plateau give place to rugged, high peaks, with exceedingly green-coloured slopes to timber line.

At the same time the climate changes to a damp one, similar to that of the northern Selkirks about Revelstoke and Big Bend. Tributary mountain torrents bring down much glacial debris, amongst which is some limestone and a micaceous sandstone. Otherwise the evidence points to a persistence of the gneiss and mica schist, so far almost totally unprospected, except by hunters, who sometimes bring in good specimens of white mica, which go to show a wide distribution of this mineral for over one hundred miles along the route.

The best-known deposits of this mica are at Mica Mountain, and near Canoe River, in the range of mountains immediately west of the great open valley between the Cache and the Canoe River. These are said to have been found by an Indian, Alexis, while goat hunting. He brought specimens to the Hudson Bay people at Kamloops, after which the properties passed into other hands. Several expeditions have been made from Kamloops to these deposits from time to time, and two shipments made, one of half a ton in 1896, and another of 600 lbs. in 1898. The mica is of good quality and sometimes cuts in dimensions of 8 by 10 inches. It is found in spots along very wide and very feldspathic pigmatite dikes, which are mostly conformable with the enclosing mica schists and gneiss. These deposits are described in Mr. McEvoy's report of 1898. Also there is some account of them, and of the North Thompson route, in the B.C. Minister of Mines Report for 1901. At that time the properties were examined and Crown granted. Since then, so far as known, little has been done.

THE ELECTROCHEMICAL SYSTEM OF AMALGAMATION AND CYANIDATION.

By Elmer Ellsworth Carey, San Jose, Cal.

ABSTRACT PUBLISHED BY SPECIAL ARRANGEMENT WITH THE ENGINEERING MAGAZINE.

In the recovery of precious metals the three methods most generally used by miners, are: (1) The gravity system, used in sluicing, rocking, panning, etc. (2) The amalgamation system, in which values are recovered in the form of amalgams; this system calls for mercury riffles, mercury baths, pan amalgamation or plate amalgamation. (3) The chemical system, in which values are dissolved in certain solutions from which they are recovered by various systems of precipitation. The leaching of values from ore is known as lixiviation and the solvent most generally used is cyanide of potassium, although other solvents are known to metallurgists.

In the gravity system only the particles of gold and platinum heavy enough to be caught in riffles can be saved; the values in placer slimes, all miscroscopic and float gold, and all the values associated with the heavy sands are lost.

When we come to consider the saving of values by amalgamation we find hundreds of devices and machines which are designed to force sand, pulp, etc., into close contact with mercury; hundreds of patents have been issued for devices in which the gangue is passed through a mercury bath; but in practical milling operations only two devices are generally used—the copper plate coated with mercury, and the mercury riffle or mercury well. Only free, clean gold will alloy with mercury ordinarily, and only clean mercury has an affinity for gold. Gold in slimes will not amalgamate under ordinary conditions, and miscroscopic, rusty and coated gold cannot be saved by standard methods of amalgamation. Gold associated with sulphur, arsenic, lead, zinc, iron and tellurium amalgamates with difficulty or not at all, owing to the fouling and sickening of the mercury. Values in slimes cannot be saved on the standard mill plate by usual methods.

In milling operations when mercury wells are used the surface of the mercury often becomes covered with a coating of fine sulphides, which diminishes its alloying properties; for this reason mercury wells are not found in many mines in the United States although they are generally used in Australia.

In lixiviation we find endless difficulties; only when certain conditions are present can cyaniding be profitably employed; there are large areas, such as are found in Idaho, where there are hundreds of mines in which the ore is not amenable to cyanide treatment. While in lixiviation theoretically we have an ideal method of gold extraction, yet in practice we find the system hedged about by a multitude of exasperating troubles; generally speaking, cyanide plants are expensive to install, difficult to operate, and the average extraction is not over 85 per cent.

In view of the above very conservative statements regarding the shortcomings of the three popular systems of gold extraction, it is not strange that investigators have long sought improved methods in the metallurgy of precious metals.

Electrochemical science has devised improved methods for the reduction and refining of the useful materials, and it is not unreasonable to suppose that the same science will point the way to even greater improvements in the metallurgy of gold.

We will suppose that both the positive and negative electrodes or wires of a battery or dynamo are immersed in water, the two electrodes being an inch apart. The positive electrode is known as the anode, the negative pole as the cathode, and the separating water is called the electrolyte. When the battery or dynamo is in operation, lines of electrical force pass between the anode and cathode through the water, and there take place in the electrolyte a number of reactions; in other words, electrochemical conditions are present in the water, and these conditions form the key to the electrochemical system of amalgamation and lixiviation. An interesting experiment can be tried by any one. Pour a few ounces of mercury into a flat glass or porcelain dish, pour over the mercury half an inch of water containing a pinch of salt or a few drops of acid; immerse the negative wire from a dry battery in the mercury. Now touch the water only with the positive wire and note the activity that at once is manifest. Try this experiment with dirty mercury and note the instantaneous brightening and cleaning of the mercury. Place the positive pole in the mercury and the negative in the water, and the mercury soon becomes foul. Restore the wires to their original positions and note that the mercury clears at once. Grind the mercury in a small mortar with some sulphur or oil and it becomes foul. Now return the foul mercury to the dish and apply the current as at first. Note the clearing of the mercury and see how quickly the detached globules coalesce. Then remove the mercury and add a pinch of bichloride of mercury to the water; immerse both wires and note how quickly there is a deposition of mercury on the cathode or negative wire. In this simple experiment is the germ of the electrolytic system for the recovery of precious metals. While the theory of electrochemical action has been known for many decades, it is only within the last few years that methods and machines for making a practical use of the theoretical knowledge have been devised.

A distinction should be made between electrochemical amalgamation and electrochemical lixiviation. In the first place no solvent is used, and the values are recovered directly in the form of amalgam. In electrochemical lixiviation the action of the solution is hastened by the presence of the electric current, and the values are deposited by electro-deposition on suitable cathodes; the cathode may be lead, copper, aluminium or mercury.

Electrochemical amalgamation may be used in connection with (a) the standard mill plate, (b) mercury wells, or (c) the mercury bath (pan amalgamation.)

When the usual copper plate is used, anodes are suspended above it close enough to come in contact with the passing flow of water and pulp, which acts as an electrolyte. The copper plate is connected as the cathode.

Electrolytic sluices with suspended anodes require more water than the usual mill plate. Mercury may be supplied as in the usual practice, or it may be supplied to the water in the form of a solution of bichloride of mercury. A solution of common salt added to the water greatly increases the efficiency of the device. High-grade graphite anodes give the most satisfactory results; there is a grade of graphite made especially for anodes which is superior to the ordinary carbon. A current density of one-tenth to one-quarter ampere per square foot of cathode surface is ample.

Mercury wells such as are described in the second volume of Richard's work on Ore Dressing can be connected electrolytically and their efficiency greatly increased, some tests were made some years ago in South Africa with mercury wells in which the baffle plates were connected as anodes, and I am informed that a similar construction is now being successfully used in California. There are several methods of constructing electrochemical mercury wells and many experiments have shown that the electrolytic mercury well is a very efficient gold saver; there is no fouling or flouring, and no scums or coating of sulphurets collects on the mercury. Electrolytic mercury wells will extract values from slimes and will recover gold that cannot be amalgamated by the usual methods; they require no skilled attention and possess many advantages over plates.

In pan amalgamation, anodes are suspended from the stirrers and the mercury is connected with the negative wire; various systems of pan amalgamation have been described especially in connection with cyanidation (Parks, Pelatan-Clerici, Molloy, Hannay, etc.) but there is no essential difference in these various processes.

Turning to electrochmenical lixiviation, the claim is made that under electrochemical conditions the cyanide solution is more active than usual; values pass into the solution which are lost in the ordinary systems; the time of treatment is reduced and the extraction increased, while there is a decrease in the operating cost; precipitation by electro-deposition goes on simultaneously with the leaching process and the usual troubles are eliminated; a molecule of cyanogen after taking up a particle of gold, is released as nascent cyanogen, having greatly increased affinity for gold and silver. The solution is constantly regenerated, the loss of cyanogen being negligible. The larger particles of gold are amalgamated directly without passing into the solution. In electro-cyanidation the pulp and solution are agitated in a shallow tank having the bottom covered with quick silver (cathode); revolving stirrers cause the pulp to travel with a circular motion over the quicksilver for an hour or two; this is equivalent to passing the pulp over several miles of mercury surface. During this period the values are amalgamated directly or pass into the solution and are precipitated by electrolysis, the extraction averaging 97 per cent. All ores, so far as known, are capable of successful treatment by means of electro-cyanidation.

Within the next few years, I expect to see the electrochemical cyanidation process perfected to such an extent that it will become automatic and continuous; pulp from the mill will continuously enter a series of tanks, and from the lower end of the system the tailings will be continuously discharged. In fact plans for such a continuous system have already been prepared.

At present electro-cyanidation is in the experimental state, although it was once used quite successfully for several months at the De Lamar mine in Idaho; electro-deposition (Siemens-Halske process) is successfully employed in many mines in South Africa.

Let us consider again electrolytic amalgamation, taking as a text the so-called base or rebellious ore. When low-grade pyritic ore is crushed to 100, 150, or 200 mesh, practically all the gold is released as free gold; but only a small percentage of the assay value can be recovered by the usual mill plate. Gold when in a very finely divided state quickly becomes coated with argillaceous, talcose, sulphurous, or arsenious coverings, and it will not amalgamate; very fine gold easily acquires coatings, gaseous or otherwise, which effectually prevent the amalgamation contact; values in slimes cannot be extracted by the usual mill plate; particles of gold in placer deposits sometimes become coated by local galvanic action, and we have rusty, silicious, or cupreous coatings which effectually prevent amalgamation. With electrochemical conditions, all these difficulties are automatically overcome, and the broad statement can be made without fear of successful challenge that all values not encased are recovered, including platinum and the values associated with black sand.

In electrochemical amalgamation and cyanidation, a few pounds of common salt should be added to every ton of ore or pulp; by electrolysis the chloride of sodium is reduced to nascent chlorine and nascent sodium. Bichloride of mercury is also added to the water or solution; this salt under electrolytic action evolves nascent chlorine and mercury. As a result of these reactions, an alloy of nascent sodium and mercury is formed; this alloy absorbs nascent hydrogen produced by the decomposition of the water, and the resulting compound, known as hydrogen-sodium amalgam, has a powerful affinity for gold; in fact no compound known to science has a more powerful amalgamating action. The water and solutions become charged with nascent chlorine and hydrogen; these gases instantly destroy foul or greasy substances in the pulp; rusty or coated gold is quickly cleaned, the gases mentioned reducing all oxides. Nascent hydrogen reduces oxides at normal temperature. As a result of this cleaning and reducing action, gold particles have been freed from all substances that would prevent amalgamation, and amalgamation takes place at the first contact with the mercurial surface. Electrochemical action keeps the mercury in a perfect state, and it also prepares the gold for amalgamation; in the mercury riffle or well we have the necessary fall to bring every particle of gold into intimate contact with the mercury surface. And as the quickened mercury surface is at all times exposed to the passing pulp, we have the most perfect conditions possible for effective amalgamation. We have therefore all the specifications which would be called for in an ideal amalgamation device—simplicity, low cost, ease of installation and operation, absence of skilled attendance, large capacity, and high percentage of extraction.

In using the electrolytic system in placer and dredge operations, the auriferous material is at first passed through a series of screens until a 10 or 12 mesh concentrate is obtained; the coarser particles of gold will be saved by the usual riffle system. The 12-mesh concentrate, containing the values ordinarily lost, is then

passed over the electrolytically connected plate or riffles of suitable length and 95 per cent. of all values not encased are recovered at a trifling expense. The successful application of the electrolytic system on gold dredges would double the net savings. Under the present system the fine tailings of the dredges generally contain greater assay values per ton than the amount of gold recovered; that is, on ground where 15 cents per yard is recovered it will generally be found that the assay value of the tailings is 25 or 30 cents per ton. In ten years I estimate that gold and platinum to the amount of $25,000,000 have passed through the tail sluices of California dredges and have been forever lost. Within the next ten years the value of the lost gold in the dredge tailings will exceed $40,000,000, unless some new system of successfully extracting these elusive values is discovered.

THE ZINC MINING INDUSTRY IN BRITISH COLUMBIA.

A convention of mine managers and others directly interested in the mining industry, especially in lead-zinc mining, was held at Nelson, British Columbia, on December 15. There was an attendance of between 40 and 50, including most of the managers of the larger lead and zinc mines of the Kootenay district. Among those present were: W. H. Aldridge, managing director of the Consolidated Mining and Smelting Company of Canada, Ltd.; J. S. Airheart, general manager, and Geo. B. Squire, general superintendent, of the Highland-United Mines, and R. A. Airheart, superintendent of the United mine, all of Ainsworth; James Anderson, of the Ruth Mines, Ltd., Sandon; A. J. Becker, manager of the Lucky Jim and Sunset mines, Slocan; G. O. Buchanan, Dominion Supervisor of Lead Bounty, Kaslo; G. F. Caldwell, Utica mine, Kaslo; A. Fournier, manager of the Selkirk Mining Co., Ltd. (Cork mine), Kaslo; S. S. Fowler, general manager the Canadian Metal Co. (Blue Bell mine), Riondel; H. Giegerich, No. 1 mine, Ainsworth, and Province Mine, South Fork of Kaslo Creek; A. H. Gracey, Nugget Mines, Ltd., Sheep Creek, Salmo; Chas. J. Greenstreet, Big Ledge mine, Upper Arrow Lake; F. W. Guernsey, Consolidated Mining and Smelting Company, Trail; Robert R. Hedley; E. Jacobs; A. H. Kelly, Dandy mine, Nelson; John Keen, Goodenough mine, Kaslo; G. Weaver Loper, vice-president Lucky Jim Mines; D. H. Nellis, Woodberry Creek, Ainsworth; T. G. Procter, Nelson; A. D. Wheeler, Gallagher mine, Ainsworth, and W. E. Zwicky, manager Rambler-Cariboo Mines, Ltd., Kaslo.

The holding of the convention was proposed by W. R. Haldane, district freight agent for the Canadian Pacific Railway Company, who interested prominent Nelson men in the matter. F. A. Starkey, president of the Nelson Board of Trade, and E. K. Beeston, secretary, then took the matter in hand and made all arrangements for the meeting in Nelson, which, after it had been called to order by Mr. Starkey, elected Mr. Keen chairman and Mr. Beeston secretary. Numerous letters of apology for inability to attend and of hearty sympathy with the chief object of the meeting, were read by the secretary, the writers including R. F. Tolmie, Deputy Minister of Mines for British Columbia; R. W. Brock, Director of the Geological Survey of Canada; Dr. Robert Bell, Ottawa; J. L. Retallack, of Kaslo (who is at present in Ottawa), and Thos. Kiddie, Vancouver.

The question of how best to bring about the provision of facilities for the profitable reduction of zinc ores so that the immense quantity of low-grade zincky ore occurring in British Columbia, particularly in Ainsworth and Slocan districts, was first freely discussed. Mr. Fowler gave the meeting some information relative to the present market for zinc in Canada. He quoted customs statistics showing that the imports into Canada of zinc in all forms—spelter, blocks and sheets, zinc white, oxide, etc., amounts annually to about 7000 tons, of a total value of about $752,000.. While this consumption may be small in comparison with that of some other countries, it is worth looking after. It is questionable whether it would be wise to ask the Dominion Government for aid in the shape of a bounty on zinc produced in Canada, similar to that now given on lead, or for higher custom duties on zinc and its products. The granting of a bounty on zinc ores might have the effect of destroying the existing market in the United States for Canadian zinc ores, and this without providing any other way for the disposal of such zinc ores and concentrates from this province. He advocated requesting the Dominion Government to make experiments in connection with the smelting of zinc ores by electro-thermic process. It was known to all that Dr. Haanel, director of the Mines Branch of the Department of Mines of Canada, had successfully carried out experiments in the smelting of iron by electricity. If the government would authorize similar experiments in connection with zinc, the Canada Zinc Company's plant in Nelson would be at its disposal, if required, or another plant could be provided by the government if thought preferable. The demonstration of the possibility of making the electric smelting of zinc commercially successful, would be a great boon to the mining industry of the Kootenay.

Mr. Loper directed attention to a provision in the United States tariff, under which the amount of any bounty paid would be added to the customs duty to be paid on articles or merchandise sent into that country, and he opposed the suggestion to seek government assistance in the shape of bounty. He advocated rather the proposal to ask for assistance in the electric smelting of zinc.

Mr. Greenstreet supported Mr. Loper's views, and added that if the electro-thermic smelting of zinc can be made commercially successful, then British Columbia, with its large quantities of zinc-bearing ores will be in a position to control the situation.

Mr. Aldridge thought the first step should be to ask the government to adopt a similar policy in regard to zinc in the West to that it had so successfully done in the East in connection with iron. The government will, no doubt, if properly approached, be prepared to make the necessary investigation and carry out the proposed experiments. The presence of zinc in lead ores is a detriment to lead smelting, so his company which has trouble in smelting ores in which there is much zinc, will be glad to co-operate with others interested in getting something practical done. In his opinion the sum of $50,000 would go a long way towards proving whether the smelting of zinc ores by electro-thermic

methods can be made to compete successfully with the present methods of making spelter.

Mr. Buchanan narrated the history of earlier movements in connection with seeking the aid of the Dominion government for the lead and zinc industries, pointing out that the Associated Boards of Trade of Eastern British Columbia had led in these matters, and the government had generally met them in a very friendly spirit. In connection with the establishment of the Dominion Department of Mines, the appointment of Hon. Mr. Templeman as Minister of Mines the appointment of a Zinc Commission and the naming those who constituted that commission—in all these things their representations had been acted upon by the government, so he thought a similar friendly attitude would be adopted towards them in the matter of assistance to the zinc mining industry.

Mr. Caldwell urged that the question of the desirability of asking for a bounty on zinc ores be thoroughly discussed at the afternoon session the convention would hold. He had benefitted repeatedly from the lead bounty, and thought many other small operators would find a bounty on zinc of similar assistance.

Mr. Zwicky informed the meeting what was done when the Dominion parliament was last in session towards securing $50.000 from the unearned lead bounty for use in experimenting with the electro-thermic smelting of zinc. He had no doubt the Canada Zinc company would place its plant at the disposal of the government for the purpose of making the proposed experiments.

After further discussion, Mr. Fowler again submitted that the chief object in view is to establish zinc smelting by the electro-thermic process on a commercial basis. He reminded the meeting that spelter is being produced electrically in Europe. The question is, can it be produced commercially here? The work already done by the Canada Zinc Company seems to indicate that success is possible.

It was then resolved that the Dominion government should be asked to make experiments, as advocated by several of the speakers and the following committee was appointed to draft a resolution for presentation to the government: Messrs. Aldridge, Anderson, Aylard, Buchanan, Fowler, Greenstreet, Loper, and Squire.

At the afternoon session this committee presented the following report; which was adopted:

"Nelson, B. C., Dec. 15, 1909.

"Mr. Chairman and Gentlemen of the Convention:

"Your committee appointed to draft a memorial to be presented to the honorable minister of mines upon the subject of aid to the zinc industry begs to report:

"We recommend that a memorial in the terms following be prepared to be signed on behalf of this convention by the chairman and secretary for transmission to the honorable minister.

"This convention, consisting of some 50 gentlemen, representing mining smelting and commercial interests in Kootenay, B. C., begs to submit to the honorable minister the following facts in regard to the industry of the production of zinc:

"That the smelter erected by the Canadian Metal Company at Frank has been pronounced a commercial failure and its operation as a zinc smelter has been abandoned.

"That the plant established by the Canada Zinc Company at Nelson for the treatment of zinc ores by an electrical process has been idle for one year, with apparently no prospect of its resumption.

"That for the year 1909 11,000 tons of zinc ores with average contents of 50 per cent. of zinc have been shipped from Kootenay points to the United States.

"That a very large quantity of zinc necessarily mined in connection with the production of lead ores has been wasted, or remains piled up on the dumps.

"The developments during the year, particularly upon the property known as the Big Ledge, on Arrow Lake, indicate that the supply of zinc ores in sight calling for treatment is very much larger than has heretofore been supposed.

"That the Payne tariff of the United States adopted this year imposes a duty of 1 cent per pound upon the zinc contents of ores carrying more than 25 per cent. zinc.

"That railway rates upon ores from Kootenay points to United States zinc smelters are very much higher than are the rates upon Mexican ores.

"That these conditions, which may now be considered as permanently fixed, render impossible the export to the United States of any but very high-class zinc ores, and upon these latter absorb the greater part of the profit to the producer.

"That from the returns of the Customs Department of Canada it appears that there are imported into Canada annually zinc products to the amount of over 7,000 tons, worth, according to customs valuation, over $750.000.

"That it is highly desirable that we should have established a smelting plant capable of treating our own ores and of turning out manufactured products of zinc at least to the extent of supplying our own market.

"That this convention therefore begs respectfully to request that the Department of Mines of the Dominion Government will take this matter up and conduct experimental work upon such a scale as will determine definitely the practicability of the economical treatment by electro-thermic or electro-chemical process of these zinc ores."

It was decided that a copy of the memorial contained in the report of the committee should be sent, not only to the Hon. the Minister of Mines, but as well to the Right Hon. the Prime Minister (Sir Wilfrid Laurier) and other members of the Dominion Government; A. S. Goodeve, M.P. for Kootenay, and Martin Burrell, M.P. for Yale-Cariboo; also to members of the Provincial Government for their information.

A committee, consisting of Messrs. Keen (chairman), Fowler, Greenstreet, Loper, and Beeston (secretary), was appointed to forward the memorial to the Dominion Minister of Mines, and, in case necessity shall arise, to reply to any enquiries that shall be made in connection with the subject matter thereof.

Mr. J. C. Harris, New Denver, urged the desirability of endeavouring to induce the Provincial Government to reconsider the two per cent. mineral tax with a view to adopting some more equitable method of taxing mines and mineral claims. He argued at length in favour of this course, and submitted a resolution accordingly.

Mr. Jacobs stated that in 1904 a committee was appointed by the then existing Provincial Mining Association to suggest to the Government an equitable substitute for this tax, but had failed to agree upon anything practicable. He reminded the meeting that plant, machinery, buildings, etc., on mines are not taxed, as is similar property at smelteries, lumber mills, and other industrial establishments. He mentioned the method followed in another country, in which he had

lived, in meeting the evil of unworked mining properties, against which Mr. Harris had so strongly urged action, but those were leased mining lands, and forfeiture, if the work clauses of the lease were not lived up to, was the customary penalty. He did not think mining men in this country would support such a revolutionary change, even were the Government asked to adopt it.

This resolution met with a similar fate to that of Mr. Caldwell—it was given a six months' hoist.

On motion of Mr. Jacobs, seconded by Mr. Fowler, the meeting adopted a resolution of appreciation of the valuable work the Dominion Department of Mines, especially the Geological Survey branch, has done and is doing in the West, particularly in British Columbia. The meeting was then adjourned.

T. L. WILLSON

THE McCHARLES PRIZE.

To Mr. Thomas Leopold Willson, of Ottawa, Ont., has been made the first award of the McCharles Prize. Mr. Willson was the pioneer in the manufacture of calcium carbide upon a commercial scale. He is a native of Canada. His inventions are the basis of a large industry.

The committee appointed to award this prize was made up of representatives from the Faculties of Applied Science of the University of Toronto, the Kingston School of Mining, and McGill University.

SOUTH LORRAIN.

Written for the Canadian Mining Journal by Frank C. Loring.

The pioneer company in the way of extensive improvements is the Keeley Mine, Limited. This company has erected a gas producer plant, furnishing power for a 10-drill compressor, 50 h.p. electric hoist, pumps, etc. Mine buildings are extensive and electric lighted. Entire plant is in excellent shape. Development consists of shaft 130 feet deep, with about 300 feet of drifts, shaft 100 feet deep, also many open cuts and trenches. Three carloads of ore have been shipped. These figures are approximate.

The Wettlaufer Mine has a 5-drill compressor, two 60 h.p. boilers, and other machinery to correspond, and extensive, well-constructed buildings, all electric lighted, capable of accommodating 80 men. Development consists of a shaft 140 feet deep, and about 500 feet of levels. Shipments to date, all since July, are 80 tons of first-class and 30 tons of second-class ore. This mine has a large quantity of ore in reserve, and will be a steady shipper.

The Montrose, Harris Lorrain, Lounsbury, and Murray have steam plants. Among other mines in operation are the Newman, Little Keeley, Keeley-Jowsie-Woods, Haileybury Silver, Clear Lake, William, Maiden and other properties with which I am not familiar. All of these are in the Keewatin greenstone or diabase rocks, and generally not further than two claims from lines of contact.

Work has been materially stimulated during the past year by the remarkable development on one of the mines above mentioned, as well as sensational surface discoveries on other properties.

Some of the veins in South Lorrain are characterized by great strength, sometimes being traceable for three or four claims. They often follow well-defined lines of faulting. They should consequently be deep seated, and although there is at present slight evidence as to depth at which ore can be found, there are possibilities in excess of some of the mines in the superficial Huronian slates and conglomerates. The advent of comparatively cheap electric power during the next few months will greatly stimulate development. There is evidence of much more extensive operation for the future.

Summer transportation is by steamer to Silver Center, on Lake Temiskaming, thence by wretched wagon roads to the mines. No effort has been made to assist the miners in maintaining good roads. During the winter snow roads from Haileybury and Cobalt, or Temagami, are used.

Personal and General

Major R. G. Edwards Leckie will spend the winter in Vancouver, B.C.

Mr. C. H. Macnutt has assumed the general management of the Poderosa Mining Co., Ltd., in Chile.

Mr. J. D. Hurd has resigned his position as general manager of the Crow's Nest Pass Coal Company.

Messrs. Eugene Coste, R. W. Leonard and G. R. Mickle have been elected members of the Institution of Mining and Metallurgy.

The following gentlemen were elected to membership in this institute at a council meeting held on Dec. 3rd:—

Members

Adsit, L. M., Eustis Mining Co., Eustis, Que.
Annable, H. W. C., Grisham House, Egham Surrey, England.
Bateman, G. C., Supt. Hudson Bay Mines, Ltd., Cobalt, Ont.
Frecheville, Wm., 35 Queen Victoria St., London, E.C., England.
Lathe, Frank E., Granby Con. M. S. & P. Co., Grand Forks, B.C.
Macaulay, D. A., International Coal & Coke Co., Coleman, Alta.
McLellan, J., Skidegate, B. C.
Miles, Arthur D., Sudbury, Ont.
Passow, F. M., Eustis Mining Co., Eustis, Que.
Rogers, R. P., Box 587, Cobalt, Ont.
Shillington, Robt. T., Haileybury, Ont.
Wilson, David G., Supt. Crow's Nest Pass Coal Co., Hosmer, B.C.,
Winckler, A. Lange, Box 609, Gow Ganda, Ont.
Young, Jacob W., Mgr. Cobalt Central Mines, Cobalt, Ont.

Student

Rayner, Geo. W., Thorold, Ont.

Yours faithfully,
H. Mortimer-Lamb,
Secretary

Book Reviews

Index of Mining Engineering Literature. By Walter R. Crane, Ph.D. 8vo., 812 pages. Cloth, $4.00 net. Morocco, $5.00 net. John Wiley & Sons, New York; Renouf Publishing Co., 61 Union Avenue, Montreal.

Professor Crane has made a place for himself in technical literature. He possesses industry, erudition, and ambition. But we fear that, in the parlance of the vulgar, he has bitten off more than he should have.

The elaborate analytical index issued last year by the American Institute of Mining Engineers purported merely to cover the transactions of that society. It was elaborately complete. Professor Crane's index, it is claimed, covers eighteen engineering publications—and more also.

Professor Crane's index is neither complete nor exact. He has confined his references to periodicals with which he happened to be familiar. And his field has been narrow. Not a few of the most useful periodicals are not indexed at all. To our sorrow, for instance, we find that the Canadian Mining Journal is not indexed at all. Also we find that our predecessor, the Canadian Mining Review, is indexed under an inaccurate title. Other sins of omission and of commission we have noticed. Therefore we feel justified in stating that Professor Crane should not have rushed into print; he should have held his manuscript by him for another five years.

Possibly the author's initial mistake is indicated in his preface. "It [the index] represents," says Mr. Crane, "the unaided labour of the author for a period of about five years." We contend that the author was guilty of a lapse in judgment in trying to bring out any such volume by himself. To this may be attributed the imperfections of the book.

However, having said our worst concerning Professor Crane's "Index," we may be permitted to say that in several respects it is very worthy of commendation. Particularly praiseworthy is the subdivision of subjects. Incomplete as each section must necessarily be, it will prove instructive to the engineer to find, grouped under heads, numerous references to subjects such as "Mill Machinery," "Animals in Mines," "Ventilation," "Tunneling," etc., etc.

We have, perhaps, said our best and our worst of the book under discussion. At worst it represents the faithful though inaccurate labours of a diligent student and reader; at best it is a compact work of reference for the engineer who reads and wishes to remember. It will do no harm to add this book to the reader's library.

CORRESPONDENCE

NASCENT GOLD AGAIN.

Probably more than the usual number of men with questionable processes for the recovery of gold and silver are at present abroad in the land. One of these, Mr. Eden, recently visited the School of Mining, and proposed that he should demonstrate his method. He claimed that it would extract more gold from an ore than any of the ordinary assay or metallurgical methods.

As such an opportunity might not come our way again, we thought it advisable to give his process a fair trial. We thought it our duty to give the public as convincing proof as we could that there was nothing in Mr. Eden's claim. We approached the subject with as nearly unprejudiced minds as was possible under the circumstances.

His method, as used here on a laboratory scale, was to take 1 A.T. of pulverized ore, add 10 c.c. of his solution, and a small quantity of mercury, and rub all together in an agate mortar for a few minutes; then to dissolve the mercury in nitric acid, and thus recover the gold.

The following is a statement of the tests made, by whom made, and the results obtained:—

Tuesday, Nov 23rd—A test made by Mr. Eden, without supervision of any kind, on a sample of Larder Lake ore, finer than 100 mesh, gave 1.25 oz. per ton.

Wednesday, Nov. 24th—Tests made on same sample as above:—

(1) Fire assay (by McKay)—average of five, checking satisfactorily—0.202 oz. per ton.

(2) Mr. Eden's method (by McKay)—0.28, 0.16, 0.19 (2 A.T. gave 0.38 m.g.), 0.05 (omitted), and 0.11 oz. Average of four results, 0.185 oz. per ton.

Total weight of four beads, 0.98 m.g. After adding silver and parting, 0.95 m.g.

These five samples were weighed alternately with the five taken for fire assay. Mr. Eden expressed his satisfaction with the way in which the tests were carried out.

(3) Mr. Eden's method (by Eden, with close supervision), 0.20 oz. per ton.

Tests made on sample of Belmont ore:—

(1) Result of mill run by students on two tons of ore, of which this was a sample, made some weeks earlier, 0.226 oz. per ton.

(2) Mr. Eden's method (by Eden, closely watched), (2 A.T. gave 0.26 m.g.), 0.13 oz. per ton

Tests made on slimes from above mill run:—

(1) Fire assay (by McKay), 0.03 oz. per ton (3 assays).

(2) Mr. Eden's method (by Eden, closely watched), (2 A.T. gave 0.03 m.g.), 0.015 oz. per ton.

A gentleman who was with Mr. Eden throughout these tests was given a sample of this Larder Lake ore, which assayed, as above stated, $4 per ton. He wrote us that, in Toronto, he, using Mr. Eden's method, got results of $17, $15, and $12 per ton, respectively, on three 1 A.T. samples.

A glance over the above results will show that although it was possible to obtain almost any quantity of gold on unsupervised tests, yet in no case did we get a greater saving of gold than might be expected from amalgamation with the aid of intimate contact between the pulp and the mercury. Needless to say, this was all we expected to prove.

Kingston, Dec. 20th, 1909. G. J. McKAY.

Editor Canadian Mining Journal:

Sir,—The following extract from the proceedings of the Select Standing Committee of the House of Commons on Mines and Minerals, recently issued, should not pass without a challenge. This extract reads:—

"Mr. Congdon.—I would like to ask the Minister if he thinks it desirable to endeavour to get a conference with the different provinces with the view to securing, to a certain extent at all events, uniform laws. Although it is impossible to get them entirely uniform, it would be of enormous advantage if the backbone, so to speak, of the legislation with regard to mining, was similar throughout the Dominion. There is one matter especially that is worthy of consideration; take the Yukon, for instance, occasionally a geologist comes in there, he spends the summer there, but he will not tell any one that he has discovered anything. About two years later we discover in some report that he has found something that is valuable—after the information has absolutely ceased to be of any value to any one. It seems to me that one of the most important things to be done in that connection would be to have one man in your department whose duty it would be to collect all the information in regard to that particular section of the country, who would spend most of his time in that country, and who would not wait for the publication of his report before giving out any information, but who would publish it as he goes along. Then it would be of some use to the people for whom it is intended. My own experience of geologists is that they are so infernally careful of their reputation that they are of no use to themselves or any one else, and that is the case with mining experts generally as a rule. They are very careful about making any definite statements that there is mineral of value there; it does not hurt a man's reputation if, after he has reported adversely, a property should turn out to be of some value, but if he should report favourably and it should not turn out to be valuable, it would injure his reputation. The whole of those geologists who have gone out from the department are so frightened of their reputations that they will not give out any information until they get back here and spend a considerable amount of time in eliminating every valuable feature from their report until they get something so commonplace that when it is published it is no good to anybody. I believe that in the Yukon, say, if there was a man of experience in the rock mining industry sent in there and allowed to remain there and to give out information to the people, and I believe the same is true of other sections of the country, such a man would be of invaluable service to the mining industry; more valuable than all the other portion of the Geological Department has been. I would call attention to the valuable work of Mr. A. H. Brooks, of the United States staff last year in the American territory. Although he was working in the American territory, he has done more good to the Yukon territory than all the men we have had in there, simply because his life is devoted to pointing out the value of the resources of the northern country, and of course there is not much difference between the Yukon and Alaska."

Mr. Congdon praises the work of A. H. Brooks in Alaska for the U. S. Government. What has this, good as it is, to do with the Canadian Yukon. His reports and information are given after mature consideration, very much in the same way as those of our own men. I think Mr. Brooks himself would hasten to disclaim the praise of Mr. Congdon.

When the people poured into the Yukon in 1898 they had with them, if they cared to carry them, Dr. Dawson's maps and report of 1887. A special revised edition of this being hastened for delivery in 1898. In that same year two parties, under Tyrrell and McConnell, were sent into the Yukon, and from that day to this field exploration has been especially active, followed each winter by reports which conveyed useful information to the general public, who paid for getting it.

If our Canadian geologists gave judgments in the field to more or less local interests, it would be hard to draw the line as to how small a coterie might receive such news. Moreover, as the Minister, Mr. Templeman, pointed out, the officers have no option in this matter. Nor is it desirable.

As to the deliberation used in getting out reports, mineral wealth is more than a summer harvest; it will keep a while, and these same reports will become very useful to those stable mining concerns and prospectors who stay in the business.

If those who call for redhot reports would heed them when they appear, we should not have the troublesome inflations of the Kootenay, Yukon and Cobalt. Who should be better able to criticize the work of the Geological Survey than the members of the Canadian Mining Institute? Yet we find that Institute steadily supporting and trying to magnify their work.

My own travels have been so continually through districts where the work of the survey is appreciated, and so dependent upon the reports and maps issued from the Geological Survey that Mr. Congdon's attitude amazes me. In fact, I do not think he would find condemnation of this work a good plank in the platform of any mining constituency in Canada.

An allusion is made to "mining experts." These may be, what they may be, the common "mining expert" is only too ready to be the opposite of "infernally careful." Experience in the boom camps of Canada shows him to be only too ready to talk and to be as infernally dishonest as the geologists would be if they followed the plan of giving early information on the spot.

J. C. GWILLIM.

Kingston School of Mining.

SPECIAL CORRESPONDENCE

ONTARIO

Cobalt, Dec. 18.—Two more properties in the North Cobalt district have recommenced operations. These are the Red Rock and Green-Meehan, which are now operated by the same company, known as the Cobalt Consolidated Silver Mining Company. During the past summer all the work was confined to surface prospecting, and it is understood that some good indications were discovered. These will be developed by a continuation of the underground workings. It had been the intention of the management to wait for the power which is being brought in, but as so many false reports have been sent out regarding the date of its arrival, it was decided to start work with their own steam plants.

Recent developments on the Lawson have shown that the course recently pursued by the new directorate in cutting the dividend was warranted. A short time ago an upraise was started from the 88-foot level on the main vein, commonly known as the "Silver Sidewalk." This upraise was continued to the surface, and it was found that the rich silver values as seen on the surface did not extend to a much greater depth than fifteen feet. The action of the directorate in cutting the dividend so soon after coming into control aroused a storm of criticism from all over, but it has been shown that this course was probably the wisest that they could have pursued. Some high-grade ore, however, has been found on the 88-foot level of the Lawson No. 5 vein. The failure of the phenomenal values of the "Silver Sidewalk" to extend to depth should not be taken as a criterion for estimating the value of the contents of the other veins, as it is necessary to carry out an extensive course of development work. Unfortunately, progress in this direction has been greatly retarded by the failure of the power companies to deliver air.

In sinking the shaft on the Silver Cross property, the diabase was encountered below the Keewatin at a depth of 123 feet.

Good reports are coming from the Beaver. A short time ago they shipped a car of high-grade ore, and they will have another ready before long. The vein from which this ore is being taken has been in the past extremely irregular, but lately it has been very regular, and has carried high-grade values throughout. Another property which has lately resumed shipments is the Townsite. This company was reorganized some months ago, and working capital furnished by English capitalists. Since that time the outlook has been steadily improving, and now the management is considering the erection of a mill to treat the large tonnage of milling ore that they have in the mine.

In connection with the recent purchase of 54,550 shares of the treasury stock of the Trethewey Mining Co., A. E. Osler & Co. have issued a statement as to the reserves of the Trethewey. The report states that the ore in sight is estimated at about five million ounces. Reports like this, however, should not be considered too seriously, as the man sent by the brokerage house to look into the property did not even see underground.

Some good ore is being taken out of the new vein found on the Maiden Silver property in South Lorrain.

Another rich ore shoot has been struck in the No. 14 vein on the Crown Reserve. For some time past the silver values have been small, but in the ore shoot just encountered they run several thousand ounces per ton. On the Silver Leaf property a large amount of development work is being carried on with favourable results. The old Silver Leaf shaft on the Crown Reserve boundary will shortly be connected with the Crown Reserve workings.

Work has been started on the foundations of the sampling plant which is being put up by a firm of local engineers. This plant will handle both low and high grade ore, and if the smelters will agree to abide by its results, it would prove to be of great assistance to the mining companies, as they will then be able to find out the value of the ore before it is shipped. This will be particularly advantageous with regard to low-grade ores, as on the value of its silver contents depends very often the smelter to which it will be sent.

A few days ago the thaw-house at the Farah was blown up, but fortunately no one was injured. This is the third dynamite explosion that has occurred within the last six weeks, the others being of a similar nature. None of them, however, was attended by any fatalities.

The district of South Lorrain is beginning to come in for a good deal of attention lately, influenced largely by the shipments made from the Keely and the Wettlaufer. A total of four cars of ore has been shipped by the latter property for this year, and it is probable that more or less regular shipments will now be maintained, as developments on the 100-foot level have shown the veins to continue fully as good as on the upper levels.

In drifting on the main vein from the No. 6 shaft on the 75-foot level of the O'Brien mine, a very rich shoot of ore was found. The vein had been lean for some distance, but at a distance of 500 feet from the shaft the values came in again. The wall rock is also well mineralized, which will give considerable tonnage of ore for milling purposes.

A concern known as the Ontario & Quebec Reduction Company is putting up buildings for a plant on the shores of Lake Temiscaming, to treat the high-grade ores of Cobalt. It is stated that the capacity will be 25 tons a day. The company is financed by Montreal capitalists. The Nipissing Central Railway when in operation will connect the mines and smelter.

A good many of the Gillies Limit claims purchased in the recent sale are now being actively developed. It is understood, however, that many of the purchasers are already regretting the high prices paid for these lots, as it is believed that they were out of proportion to their value. Development is, and will be, retarded, however, on account of the lack of power, but as soon as the power companies are in a position to distribute air and electricity, development will be carried on on a large scale, and underground work will be started on many of the claims now lying idle. Although the Hydraulic Company has promised air for the middle of January, it is very improbable that they will be able to deliver it till about a month or two after that date, as there still remains a large amount of rock work to be done in the 1,000-foot tunnel between the intake and outlet shafts.

The Waldman has struck its big vein in the east drift, and from that point an upraise will be started. The shaft on this property is now down 90 feet, and drifts are being run on the 75-foot level. The new plant on the Wyandoh is being rapidly installed, and there will now be on the ground a six-drill compressor and two 60 h.p. boilers. It is stated that the plant will be in operation about Christmas time.

The Mount Royal Silver Company has called a special meeting for Dec. 22nd to discuss the advisability of issuing 200,000 shares of stock at 25 cents. At the present time there are 700,000 shares in the treasury. The money raised by the sale of stock will be used to buy machinery to develop some of the veins found on the surface. This property is situated at Elk Lake.

A short time ago a deputation waited on the Premier of the Province to ask for a reduction of the excessive royalties which some of the mines are forced to pay. In the past the royalties were based on the gross value of the ore as it came from the mine. In future, however, the royalty will be based on the net profits accruing to those companies that were so fortunate as to have their royalties reduced. The Government has announced

that they have decided to make some alterations with the mining companies in the townsite of Cobalt and also Chambers-Ferland, and instead of having a flat rate of 25 per cent., they will charge a royalty of 25 per cent. on the net profits of the mines, which will be ascertained under the provisions of the Supplementary Revenue Act. The mines that will be benefitted will be the Townsite, Nancy Helen, City of Cobalt, Wright Mining Company, Railway Reserve, J. Harris, McCrae, Ontario Development and Mining Co., Chambers-Ferland, and the Cobalt Station Grounds. All of these properties, with the exception of the Chambers-Ferland, pay royalties to the T. & N. O. Commission. The Chambers-Ferland will pay directly to the Ontario Government. The properties affected that are shippers, and therefore directly benefitted by the reduction, are the City of Cobalt, Cobalt Townsite, Nancy Helen and Chambers-Ferland. It would appear that the Government has made these reductions without going very deeply into the rights or wrongs of the case, and only those companies are affected that are unable to pay dividends under the present excessive charges.

The chief topic of interest at the present time in this district is the new gold discoveries around Porcupine Lake. The country has been staked for miles, and as far as can be seen, it would appear that there will be a stampede into this country similar to the one into Gowganda a year ago. So far the lack of transportation facilities has discouraged many from going in, although a large number of prospectors have gone in on foot. Supplies are being concentrated in Matheson, so that they will be available when the road, which is going through to Night Hawk Lake, is completed. A large number of dog teams and horses are already on the ground, and more are arriving daily. A deputation of prospectors and miners interviewed the T. & N. O. Commission at Matheson, and were assured that every facility will be offered them for handling the freight and passengers from that point. Many sales have already been reported, and several well-known concerns have acquired property in the new district. A party of Pittsburgh men have purchased six claims for twenty thousand dollars, and a force of men will be sent in at once to develop these claims. The big firm of McArthur & Co., of Glasgow, Scotland, has also purchased six claims for a large sum, and already men and supplies are being sent in. This company proposes to sink four shafts to a depth of 200 feet each. The Timmins Syndicate has also left for this district with thirty men to erect camps on the Hollinger claim, and the O'Brien interests have also sent in a gang to help get the road in shape and take in supplies. Gifford Gold Fields, Limited, is also preparing to develop its holdings and has made provision for sending in men and the necessary supplies. It is understood that during the winter several companies will install plants. The development of this new section is being looked forward to with unusual interest, and unfortunately gold mining in Ontario has usually proved to be a rather unprofitable investment. This, however, has been due, to some considerable extent, to mismanagement, which unfortunately is so often apparent in gold mining. Many of the properties which will be developed this winter are, however, under the control of men familiar with mining in this district, and good results can be expected if it is possible to obtain them.

It is unfortunate for the Gowganda district at the present time that the Bartlett mine should have made such a poor showing. The wide publicity which was unfortunately given to this property last winter was responsible to a considerable extent for the boom which resulted, and the ensuing depression was much greater in consequence. If this property had been properly worked it might have had a good chance, but as it was, a plant which cost in the neighbourhood of $125,000 to install was put in before even a test pit of any extent had been sunk. The company is now unfortunately rather short of funds, and it is understood that unless money can be raised in some manner, work is likely to be discontinued.

BRITISH COLUMBIA.

Rossland.—The mining outlook here is certainly brighter than it was a few months ago. The Le Roi is continuing to make weekly shipments of good ore, although the output is not large. The lessee of the Velvet Portland mine has already shipped 71 tons of ore that will return over $32 per ton while shipments from the Le Roi 2, Ltd., and the Consolidated group continue to run up a good average. The output of the camp is 4,600 to 5,000 tons per week.

The two diamond drills at work in the depths of the Le Roi have encountered some good ore, and drifting on these prospects is the present order of things.

The shaft of the Josie claim of the Le Roi 2, Ltd., is now down to the 1,300 foot level. It will be driven about 50 feet more when the work of drifting on and opening up the ore from the 950-level downward will be started. The mill at the Le Roi 2, Ltd., is treating 260 tons of second class ore per week regularly.

A good find of free gold has been made in the ledge now being worked in the I. X. L. mine here by Evans & Brokenshire. The ledge is about two feet wide and some rock has been extracted carrying coarse gold. The operators are in hopes that they are approaching one of the bonanza shoots that were frequently found in the property in early days..

Phoenix.—The ore shipments from the B. C. Copper Co. Mother Lode mine reached a new record figure during the week ending Nov. 27th, the company sending 11,616 tons to the Greenwood smelter from that property. The week following the Oro Denoro mine dropped from the shipping list. The crew has been reduced while certain development work is being done.

The eighth and last big furnace at the Grand Forks smelter of the Granby Co. was put into commission last week, completing the work of augmenting the eight furnaces started early in the year. By this means the capacity of the smelter has been increased from 1,000 tons per day to 4,000 to 4,500 tons. No doubt, with this complete equipment, the Granby will make some record shipments and smelter runs in the near future.

There is a rumour afloat here that the men behind the Granby Co. are making an effort to secure control of the B. C. Copper. Co. (which now controls the New Dominion Copper) and thus place all of the big copper producers of the Boundary proper under one control. It is said that the proposal has been made by the Granby in the Eastern States of one share of Granby stock for ten shares of B. C. Copper, equivalent to nearly $10 per share for B. C. Copper. This proposal was not enticing enough to lure the control from the present owners who say, however, that they might entertain an offer of about double that amount.

It is a difficult matter for the ordinary individual to see what great advantage would be gained from this move, aside from a reduction of certain expense items, the benefit of large areas of ground for future use, that is known to contain prodigious low-grade ore bodies, and those many advantages that accrue from having such low-grade properties under one able management. It may be the New York copper clique want to make the Granby one of the big going concerns. It would prove the placing of the old Dominion Copper relics a step farther away from those dissatisfied shareholders who still keep feebly rapping away at what seems a hopeless cause. The thing has not taken any perceptibly tangible form as yet, however, and when a little more is known of the real situation, much that is now nebulous may be cleared up.

Application has been made in the Supreme Court at Vancouver that the money in the hands of the liquidator of the Dominion Copper Co. be paid into court and the liquidator released, on the ground that he failed to advertise for creditors.

Diamond drill exploration has been started on the Rawhide claim of the New Dominion Copper Co. This is the first work that has been done in this mine since the old company ceased work when in financial trouble.

In the Argo tunnel at Greenwood a 20-inch galena ledge was cut last week 260 feet from the portal. The compressor from the Crescent mine is being moved to a point near the mouth of the Phoenix-Greenwood adit and machine drills will be working in that tunnel in a couple of weeks in place of hand drills as of late.

During the month of November the Granby smelter treated over 120,000 tons of copper-gold ore, equivalent to approximately 31,680,000 lbs. copper per annum. There is no good reason, however, at the present time, why the Granby smelter is not treating nearly 100,000 tons per month, and it is possible the figures will reach this mark in December. This ore, which yields about 22 lbs. copper per ton, (it was 21.81 for the year ending June 30, 1909), can be mined, smelted, converted to blister copper and loaded on the cars at Grand Forks for approximately $2.50 per ton. The unsteady coke supply has in the past been the bane of local smelters—the Granby has forfeited itself in this direction by investing over a million dollars in the Crow's Nest Pass Coal Coo. This, no doubt, had something to do with the C. N. P. Co. continuing to work while the other mines were tied up with strikes last spring.

Nelson.—On the 15th of December a convention of mining men and delegates from the surrounding associated boards of trade will be held in this city to consider the several phases of the zinc situation as it presents itself to local zinc-lead miners, with a view to improving and aiding this industry. The chief market for the product of local mines, at the present time, is found in the United States, the freight charges to distant zinc smelters amounting to about $10 per ton, and the duty entering the States being practically double this amount. The points that will especially be touched upon and discussed will be the establishment of a commercial zinc smelter in this district; encouragement of zinc manufactories in Canada; the invocation of Dominion Government aid toward experimental work in electrical and other zinc smelting; bounty on zinc mined; and the increase of duty on manufactured zinc products from foreign countries.

The Provincial Government has aided the Nelson experimental electric smelter with from $20,000 to $25,000. The local men interested say that if they had the money on hand they could make the plant a commercial success. The zinc problem in this district is a difficult one. Concentration is only partly successful. Ore and concentrates now have to be shipped to Kansas, Missouri, and even Germany, for treatment. As depth is gained in the lead mines of the district, the zinc becomes blended with the silver and lead, whereas on the surface it often runs in narrow veins and is somewhat easier to cope with.

The influence of the big zinc pools, the competition of big producers and other factors all count against the growing industry of the Slocan-E. Kootenay district, in addition to the troubles they have at home, and it would be a laudable move on the part of the Government if it would take action to foster the industry. There is no doubt but that it would be amply repaid in the years that are to come.

A 20-ft. vein of good milling ore has been opened up on the limited property of the Highland-Buckeye Mining Co. The ore was located at 200 ft. depth in the shaft. A 250 gallon pump is being installed to cope with the heavy influx of water on this ground. This is characteristic of many local properties and has been found a costly inconvenience. A tramway is to be built from the United mine to the Highland mill.

GENERAL MINING NEWS.

NOVA SCOTIA.

Sydney, N.S., Dec. 15.—The steamer Cape Breton, of Glasgow, left here to-day for Prince Rupert with 6,800 tons of steel rails. Besides this, it is understood that several foreign ships will take cargoes of rails from Sydney to Prince Rupert.

The Dominion Iron & Steel Company have been for some time negotiating for a modification of the order-in-council prohibiting foreign vessels from engaging in the coast trading trade to enable these foreign ships to engage in the Sydney-Prince Rupert trade. To that extent a modification has been secured.

Halifax, N.S., Dec. 17.—Thos. Cantley, general manager of the Nova Scotia Steel Company, positively refused to tell the prices realized in Montreal in 1909. Mr. Cantley's reason for declining to reply to the question was that he would be seeking to get contracts for the sale of 300,000 tons of coal in that market within a few weeks and to give this information would mean that he would seriously injure his company. Eventually after counsel on both sides had argued the matter at length, the stipendiary ruled that the information seemed necessary and must be given. Mr. Cantley still was obdurate. Application was then made for his committal to jail, and then witness rose and reiterated his previous statements. He said that if the strong American competition that they were meeting in the St. Lawrence now could learn their prices beforehand, it might mean that the Nova Scotia Company would lose their contracts. Holding these views and without meaning any disrespect to the court, he must still decline to answer. Counsel for the prosecution still pressed the motion for Cantley's committal to jail, but the stipendiary suggested that the answer be written out, sealed and placed in the custody of the court.

This was eventually agreed to by Mr. Cantley, but not until he had been definitely assured that no one but the stipendiary would see the document.

G. H. Duggan, second vice-president and general manager of the Dominion Coal Company, was a witness to-day. He had with him a quantity of correspondence between his company and the Cumberland Railway and Coal Company during the past three months, which he was subpoenaed to produce. The letters were submitted to the magistrate, and it was found they did not relate to matters covered by the inquiry.

Mr. Duggan also produced letters between his company and the Nova Scotia Steel Company. Two of these referred to some English coal coming to the St. Lawrence, and were tendered to show there was some agreement between the two companies. A long discussion of counsel followed as to admission of the letters.

NEW BRUNSWICK.

Fredericton, Dec. 20.—The Canadian Antimony Co., Ltd., has closed its mines at Lake George. There was a bad fire at the mines some time ago, and that, coupled with the poor outlook of the market, has caused a temporary shutdown.

ONTARIO.

Sudbury.—Work on the stamp mill of the Canadian Exploration Company at Long Lake has been vigourously pushed, and it is expected that stamps will be dropping before Christmas. The success of this enterprise will be of much importance to this district. Mr. R. W. Brigstocke is engineer for the company, and has given his personal attention to the equipment of mine and installation of plant.

Toronto, Dec. 17.—As a result of representations of large deputations of mining men who have waited on the Minister of Mines, the Ontario Government has decided to grant a measure of relief to certain mining companies now operating on the townsite of Cobalt and vicinity. It was found on investigation that these mines could not be operated under the excessive royalty exacted.

The Government has therefore decided to reduce the royalty from 25 per cent. on gross output to 25 per cent. on net profit of the mines, which is to be ascertained under provisions of the Supplementary Revenue Act.

The companies affected are Townsite, Nancy Helen, City of Cobalt, Wright Silver Mining, Railway Reserve, Jackpot Mining, J. Harris McCrae, Ontario Development, Cobalt Station Grounds and Chambers-Ferland. All the companies in question obtained their lands from the T. & N. O. Commission.

Toronto, Dec. 18.—Ten men were arrested in connection with the Cobalt ore stealing conspiracy. On Thursday two arrests were made, and yesterday eight more were made, six in Toronto, and two in Cobalt. Shortly after 8 o'clock Inspector of Detectives Duncan received word from Chief Geo. Caldbrek, of Cobalt, that two of the many men who were being looked for there had been apprehended.

By what the police learned from the men arrested in Toronto yesterday, it would appear that Dr. J. E. Wilkinson, President of the J. E. Wilkinson Refining Co., who is on remand and out on bail for $20,000, purchased from men in town as well as from men in Cobalt. The local men in the "Ward," who, it is alleged, were buying from the go-betweens who came down regularly from Cobalt, admitted yesterday that they sold their ore to Wilkinson, and the cheques found in Wilkinson's office on Lombard Street after his arrest Thursday afternoon go to show that he had paid out a good amount of money to the men who are now under arrest.

The men arrested in Toronto were:—

Nicholas Zojotz, Austrian, miner, charged with receiving stolen property.

Dynamtis Antras, Austrian, miner, charged with receiving.

Jacob Cohen, 78 Agnes Street, Hebrew, charged with receiving.

Morris Robshensky, 93 Elizabeth Street, Hebrew, charged with receiving.

William Jansen, Cobalt, bartender, charged with selling stolen property.

Jaakka Heikkik, Cobalt, miner, charged with selling stolen property.

The men arrested in Cobalt last night were: J. H. McGale, hotelkeeper, charged with receiving; H. A. Vanwinkle, insurance agent, charged with receiving.

Toronto.—Dr. J. E. Wilkinson, whose name is implicated in the ore-stealing incident claimed to be ignorant of the recent change in the Criminal Code, Section 424. The change is as follows:—

"Everyone is guilty of an indictable offence and liable to two years' imprisonment who

"(a) Being the holder of any lease or license issued under the provisions of any act relating to gold or silver mining, or by any persons owning land supposed to contain any gold or silver, by fraudulent device or contrivance defrauds or attempts to defraud His Majesty, or any person, of any gold or silver or money payable or reserved for such lease, or, with such intent as aforesaid, conceals or makes a false statement as to the amount of gold or silver procured by him; or,

"(b) Not being the owner or agent of the owner of mining claims then being worked, and not being thereunto authorized in writing by the proper officer in that behalf named in any act relating to mines in force in the province in which the offence is alleged to have been committed, sells or purchases, except to or from such owner or authorized person, any rock, ore, mineral, stone, quartz or other substance containing gold or silver, or any unsmelted or untreated, or unmanufactured, or partly smelted, partly treated, or partly manufactured gold or silver: or

"(c) Purchases any rock, ore, mineral stone, quartz or other substance containing gold or silver, or any unsmelted, or untreated, or unmanufactured, or partly smelted, partly treated, or partly manufactured gold or silver, except from such owner or authorized person, and does not, at the same time, execute and triplicate an instrument in writing, stating the place and time of purchase, and the quantity, quality of gold and silver so purchased, and the name or names of the person or persons from whom the same was purchased, and within ten days file the same with the clerk of the county or district court of the county or district in which the purchase was made, or with the officer with whom in the said county or district bills of sale or mortgage of personal property are filed or deposited."

BRITISH COLUMBIA.

Nelson.—A convention of mine owners and others interested in the production and marketing of zinc ores to discuss ways and means of improving the marketing and disposing of the products, will be held in Nelson on Wednesday, Dec. 15th. The presence of zinc in ores, especially in the Kootenay district (except in a few special cases) has been a detriment rather than a benefit to mine owners. At the same time the only market is practically in the United States, the average freight being $10 per ton, and the duty about the same, making a charge of some $20 per ton to place the zinc ores of this district at the smelter.

It is felt that the time has arrived when these conditions might be improved, and that some action towards promoting this might be brought about by a conference of those interested.

In the first place, in order to present the question in all its bearings it will be necessary to have some authentic information regarding the present production of zinc ores and other matters in connection therewith, and this can be gathered at such a meeting.

The matters which present themselves as being worthy of discussion if a meeting can be convened are:—

1. The establishment of a zinc smelter in this country.

2. The establishment of home manufactories of zinc products.

3. The asking for government aid for assistance in experiments.

4. The asking for a bounty on zinc similar to that at present in force for lead.

5. The asking for the increase of the duty on zinc ore products, such as spelter oxides, etc., which now come into this country, principally from the United States, either free of duty or at a low tariff.

MINING NEWS OF THE WORLD.

EUROPE.

Spain.

In view of the likelihood of the Spanish oil fields assuming an important position in the world's production, some remarks by Senor Don Claudis Sanz, of the Company Petrolifera de Villamartin, are of considerable interest. The property is situated less than two kilometres from Villamartin, and Senor Sanz was able to report that the work being carried on is meeting with excellent results. Boring is in progress, and at depths of 75 to 110 metres and also from 250 to 300 metres petroleum has been proved to be good and abundant.

Roumania.

For the first nine months of the current year the production of oil in the Roumanian fields amounted to 956,614 tons, while for the corresponding period of 1908 the output was only 866,762 tons.

Turkey.

The Sublime Porte has well received the proposition of the Minister of Mines concerning the suppression of all duties for the obtainment of mining concession Firmans. This will contribute towards the progress of the mining industry in the country.

Russia.

Recent reports of activity in the oil district of Maikop in Southern Russia have been quickly followed by the flotation of the Anglo-Maikop Corporation, Ltd. The capital is £200,000, only take up such as are approved. Reports on the properties are of a highly favourable character, and already the company has received a good offer to purchase a single plot over which it holds an option.

Another concern formed to deal with oil properties in Russia is the Russian Eastern and General Petroleum Trust, Ltd., which has just been registered with a capital of £50,000 in £1 shares. At present it is only a private company, but no doubt the public will be invited to participate in due course.

SOUTH AFRICA

The suggestion made by Mr. Reyersback, a member of the firm of Wernher, Beit & Co., before the Chamber of Mines at Johannesburg, recommending the discontinuance of monthly returns of the output and labour, met with a storm of protests. Particularly effective is the signed statement of a group of prominent London Stock Exchange firms, which in part is as follows:—

As dealers for many years in the African mining section of the Stock Exchange we shall be obliged if you will spare us space to protest against the preposterous proposal of Mr. Reyersbach, at the late meeting of the Chamber of Mines at Johannesburg to discontinue the monthly returns of output and labour.

In the note published in a financial paper Messrs Wernher Beit & Co., appear to favour Mr. Reyersbach's proposal, which they say would, if adopted, be beneficial. We are strongly of the contrary opinion, and consider that it would be highly detrimental to the interests of the shareholding public. The mere suggestion of it coming from such a source came as a coup de grace to an otherwise demoralized market, and the only parties to whom in our opinion it might be beneficial are the large mining houses who are every day dealing in the shares of the companies, in competition with the members of the Stock Exchange, whilst in many cases partners in the various mining firms are acting as directors of the companies in whose shares they deal.

The shareholders and the dealers on the Stock Exchange would be left in the dark as to the position of the mines for twelve months, whilst the outside mining firms were continually supplied with the latest developments, which they would doubtless make use of for their own benefit.

A committee was formed last year of technical representatives of the mining groups of the Rand for the purpose of conducting experiments in connection with the metallurgy of the Rand. The object was to test promising devices and methods on producing mines, the cost of the investigations being borne by the groups. One of the questions taken up this year by the trials committee has been the economic ore reduction by means of gravity stamps and tube mills. The trials carried out at the Simmers East mine upon the combined duty of gravity stamps and the tube mills have shown that by enlarging the size of the screen mesh the efficiency of the combination was regularly increased until the limit with stamps weighing 1,400 lbs. was reached with a mesh of nine holes to the square inch, when a duty of 15 tons per day was recorded. It was found that on a larger quantity of material being put through the overflow was unsatisfactory in grade with respect to subsequent operations. Conducted within the average range of the appliances as used upon the Rand, the experiments have been of incalculable value, not only from the practical point of view, but also in the matter of mathematical data referring to the subject, which have been prepared at some length by Mr. Stadler. The investigation has been a long and costly one, but the committee are pleased to be able to say that the results have quite come up to their expectations. There still remains much work in improving the efficiency of the stamps and tubes separately.

RHODESIA

The general position is again brighter and the outlook more promising on developments at numerous points. Exploration work is being actively prosecuted over wide areas, and business in claims is again brisker.

The Rhodesia Exploration Company has secured a large number of claims in the Enterprise district on a line of auriferous schist formation extending several miles. Excellent milling and assaying results have been obtained. The acquisition is regarded as important generally and of particular value.

A line of country extending eighteen miles has been pegged on the Rusapi tin belt, 80 miles to the south-east of Salisbury. The assays are stated to give an average of 1½ per cent. over a width of 110 ft. The belt is in kopje formation and only the simple and inexpensive method of quarrying will be necessary in mining. Bunches of ore have given high assays.

AUSTRALIA

The State Colliery at Powlett River is working. It is estimated that in a month's time it will produce 400 tons daily.

It is understood that the Victorian railways are ordering coal in England.

The Commissioners announce that they will be able to handle the grain traffic during the approaching harvest without further curtailment of services, even on holidays.

The coal lumpers have struck as a protest against the arrest of their leaders. The Government has rejected a suggestion

made by the Lord Mayor that it should take over and work certain mines.

The question of the establishment of State smelting works in Queensland has lately been occupying attention, and the Chief Inspector of Mines has been instructed to report upon the proposals which have been put forward. Owing to the more or less scattered nature of the mineral deposits in Queensland, there are in some districts no treatment works at all available for small quantities of silver, lead or copper ore, and the main objects to determine are whether material assistance to the mining industry will follow as a result of the establishment of smelting works, and whether this industrial field can be entered by the Government without financial loss. The bulk of the State's annual output of gold concentrates results from the treatment of Charters Towers and Ravenswood ore.

UNITED STATES.

California.

The gravel-mining districts in Eldorado county are being more actively worked.

Montana.

An effort is to be made to introduce legislation that will lessen accidents, improve sanitary conditions, and generally regulate the operations of the larger mines of the State. The State Mine Inspector, in his annual report, asserts that of the forty-seven fatalities recorded, the greater number were due to carelessness on the part of the miners.

The strike of the switchmen on the Great Northern and the Northern Pacific is still on. As both roads run into Butte, the mines depending upon these roads, about twelve in all, have been forced to close.

Missouri and Kansas.

During November the Kansas mines produced 3,487,650 lbs. zinc and 302,470 lbs. lead, having a total value of $97,467.

Arizona.

The United States Smelting, Refining and Mining Company has purchased the entire holdings of the Arizona-Mexican Mining and Smelting Company, which consists of a copper and lead smelter at Needles, Ariz., with a number of developed and semi-developed mines tributary thereto.

In addition to the holdings of the Arizona-Mexican Mining and Smelting Company, the United States Smelting, Refining and Mining Company has acquired a large number of claims in the same neighbourhood. The smelter is so situated as to handle the ore of Southern and Central Nevada, Southern California, Southern Utah and Northern Arizona more economically than any other plant. The ores in the mines that have been taken by this company are mainly silver and lead, and some copper.

Company Notes

The Right of Way Mining Company has declared another dividend of 6 per cent. on the old stock, which is equivalent to .02 per cent. on the new capitalization. Books close on Dec. 20, and dividends are payable on Jan. 1.

CROWN RESERVE MINING CO., LIMITED.

Dividend No. 6.

Notice is hereby given that a special bonus dividend of 10 per cent. has been declared and will be payable on the 20th of December, 1909, to shareholders of record the 10th of December, 1909. Transfer books will be closed from the 11th to the 18th of December, both days inclusive.

Dividend No. 7.

Notice is hereby given that the regular quarterly dividend of 6 per cent. for the three months ending the 31st of December, 1909, and a bonus in addition of 9 per cent. for the same term, making a total payment of 15 per cent., has been declared, and will be payable on the 15th of January, 1910, to shareholders of record the 31st day of December, 1909. Transfer books will be closed from the 1st to the 14th of January, both days inclusive.

STATISTICS AND RETURNS

BRITISH MINERAL OUTPUT IN 1908.

The report on mines and quarries in the United Kingdom for 1908 has just been issued, and places the total value of minerals mined during the year at £130,003,670. During that period 261,528,795 tons of coal were mined with a value of £116,598,884. Of this over 65,500,000 tons were exported.

For the 36 years from 1873 to 1908 inclusive, the total value of the coal output was £2,361,701,000, while the value of other minerals was £500,021,000. The exports of coal have been steadily increasing during the 36 years. In the period 1873 to 1877 the amount exported was 13.8 per cent. of the total output. In the third 1903 to 1907 the exports had increased to 61.1 per cent., while in 1908 the exports declined to 32.6 per cent.

The depression in trade in 1908 was marked, and had its influence on the mineral output for the year, which was £2,275,418 less than in the year 1907. Of the total decrease in the value of minerals produced in 1908, coal accounted for £3,928,530. The amount of coal retained for home consumption was 176,222,650 tons, or a little less than four tons per head of the population.

The blast furnaces for the manufacture of pig iron consumed 18,842,464 tons, as compared with 21,119,547 tons in 1907.

NIPISSING NOVEMBER OUTPUT

The Nipissing company's output of ore for November had an estimated value of $177,731. Nearly half of the ore was mined from the Kendall vein. The monthly production and shipments for five months were:

	Ore Mined	Ore Shipped
November	$177,731	$222,294
October	178,197	167,075
September	150,668	240,270
August	152,449	201,817
July	150,078	116,428

President dividends at the rate of 30 per cent. call for the payment of $150,000 per month.

COBALT ORE SHIPMENTS.

The following are the shipments from the Cobalt camp for the week ending December 17th, and those from January 1st, 1909, to date:—

	Ore in lbs. Dec. 17.	Ore in lbs. Since Jan. 1.
Buffalo	41,826	1,094,017
Beaver	51,470	101,470
Carnegie	.....	63,410
Chambers-Ferland	.....	961,010
City of Cobalt	.....	1,204,927
Cobalt Central	43,120	815,267
Cobalt Lake	.....	141,340
Cobalt Townsite	.....	54,369
Coniagas	.....	1,504,378
Crown Reserve	102,504	5,940,217
Drummond	.....	1,962,100
Foster	.....	187,800

Other Mines	1,042	60,683
Total	8,771	403,562

The imports of petroleum into Germany in the first nine months of this year are estimated at 634,476 tons, of which 493,604 tons were from America, 93,966 tons from Galicia, 26,238 tons from Russia and 20,668 tons from Roumania. During the corresponding period of last year the quantity imported was 684,047 tons.

TORONTO MARKETS.

Metals.

(Quotations from Canada Metal Co., Toronto.)

Dec. 22.—Spelter, 6½ cents per lb.
Lead, 3.75 cents per lb.
Antimony, 8½ to 9¼ cents per lb.
Tin 36 cents per lb. (market advancing. We look for higher prices.)
Copper, casting, 14 cents per lb.
Electrolytic, 14 cents per lb.
Ingot Brass, 9 to 12 cents per lb.

Dec. 22.—Pig Iron, (Quotations from Drummond FcCall Co.)
Summerlee, No. 1, $24.00, (f.o.b. Toronto).
Summerlee, No. 2, $23.50, (f.o.b. Toronto).
Midland; No. 1, $21.50 (f.o.b. furnace).
Coal, Anthracite, $5.50 to $6.75.
Bituminous, $3.50 ao $4.50 for 1¼ inch lump.

Coke.

Dec. 17.—Connellsville coke, (f.o.b. ovens).
Furnace coke, prompt, $2.80 to $2.90 per ton.
Foundry coke, prompt, $3.00 to $3.25 per ton.

Dec. 17.—Tin, (Straits), 33.05 cents.
Copper, prime Lake, 13.50 to 13.75 cents.
Lead, 4.60 cents.
Electrolytic copper, 13.37½ to 13.50 cents.
Copper wire, 15.25 cents.
Spelter, 6.30 cents.
Sheet zinc, 8.50 cents.
Antimony, Cookson's 8.37½ cents.
Aluminium, 23.00 to 24.00 cents.
Nickel, 40.00 to 49.00 cents.
Platinum, 29.50 to 33.25 per oz.
Bismuth, $1.75 per lb.
Quicksilver, $52.50 per 75-lb. flask.

Nova Scotia Steel had a good month during November.

November was indeed the banner month in the company's history.

The output was 81,200 tons. Exceeding the previous record by about 4,000 tons.

The output of pig iron was 5,400 tons; steel, 6,500 tons.

Coal shipments to date are about 125,000 tons ahead of last year.

MINING BOOKS

Dredging for Gold in California

by D'Arcy Weatherbe

220 pages, indexed, illustrated. $4.00 postpaid

It is acknowledged by experts that modern dredging owes much to California, for in the Oroville and Yuba districts the successful extraction of Gold has stimulated mechanical ingenuity.

California methods are being adopted elsewhere. In "Dredging for Gold in California," Mr. Weatherbe describes in detail the California practice. The book is well illustrated with diagrams, drawings and photographs and gives invaluable data on working costs.

A Guide to Technical Writing

by T. A. Rickard

127 pages. Indexed. $1.00 postpaid.

"This manual is intended to help those who wish to write clearly on technical subjects. Rules are useful, but the understanding of the reason on which the rule is based is better. No man can apply a rule until he understands when to disregard it."
—From the Preface.

Through the Yukon and Alaska

by T. A. Rickard

Beautifully illustrated with over 175 half-tone cuts and maps.

408 pages. Indexed. $2.50 postpaid.

This book is an account of a journey through the Yukon Territory and the District of Alaska during the summer of 1908, and is a non-technical description of a region of great technical interest. The scenery, people, and industries of the north are described by a traveler trained to observe and write in an interesting manner.

Recent Cyanide Practice

by T. A. Rickard

350 pages. Indexed, illustrated. $2.00 postpaid

A compilation of the best and most trustworthy articles on the subject by authors that are leaders of this particular branch of metallurgy. Describing in detail the latest improved machinery and devices, and giving invaluable data concerning working costs.

The Metallurgy of the Common Metals

by L. S. Austin

Second Edition, entirely re-written and enlarged, illustrated, indexed.

500 pages $4.00 postpaid

A simple comprehensive treatise on the metallurgy of gold, silver, copper, iron, lead, and zinc ores. Of all the numerous books on metallurgy this is the best for those desiring a general knowledge of all branches of the art. It will appeal particularly to the worker in one branch who wishes to know the essential facts about other sorts of ore reduction. It is a good text-book for universities and technical schools.

Aaron's Assaying

by C. H. Aaron

Part I—Gold and Silver Ores. $1.00 postpaid.
Part II and III—Gold and Silver Bullion, Lead, Copper, Tin, Mercury. $1.50 postpaid.

A standard work in Assaying and thoroughly up to date. The result of years of experence and teaching by a competent assayer. These Books are technically accurate in their description of the most approved methods of assaying.

Hints on Amalgamation

by W. J. Adams

Third Edition, Revised and Enlarged. Pocket Size. Flexible Leather Cover.

120 pages. $2.00 postpaid.

A book in which the experienced amalgamator will find many valuable 'hints' and that will enable the novice to learn correct methods of current practice. If every mill-man would thoroughly assimilate the contents of this little volume it would keep him from making many costly 'breaks'.

Fire Assay

by L. S. Austin

88 pages. $1.00 postpaid.

There are many books on Assaying, but none are better calculated to serve as a ready reference for the assayer seeking the more commonly recognized methods for the determination of Gold, Silver and Lead in Ores and Metallurgical Products as Prof. L. S. Austin's Fire Assay.

Journeys of Observation

by T. A. Rickard

Handsomely Illustrated. On Heavy Coated Paper.

500 pages. Author's Edition $5.00 Cloth $3.50

This book contains the observations made by a traveler who happened to be a mining engineer with the facility to write in a lucid and entertaining manner. The descriptions relate to two of the most interesting mining regions, namely, Colorado and Mexico. In both cases the local coloring, the picturesque element, the geological structure, and the industrial conditions, are all interwoven into a fascinating account of mining development and metallurgical progress.

BOOK DEPARTMENT Canadian Mining Journal

Confederation Life Building, Toronto

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

A CROWN MINERAL PROPERTY

Suppose the Government should say to you there is a property worth $10,000. We will sell it to you for $10,000, payable in 20 annual instalments and won't charge interest on deferred payments. In event of your death at any time during the 20 years, we guarantee to cancel the balance due and execute a warranty deed to your wife, or if she prefers, we will pay her $10,000 in cash. If you live to complete all payments, we will pay you $10,000 cash, plus interest earned on your annual deposits. Chances are you would jump at it. We are making just such an offer backed by assets of over $45,000,000. Better investigate it.

GEOLOGICAL SURVEY

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

MARITIME PROVINCES

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

QUEBEC

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

ONTARIO

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

THE NORTH WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.

THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

CANADA

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet.
1025. Waverley Sheet.
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

ONTARIO

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

YUKON

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

REPORTS

1072. Summary Report of the operations of the Geological Survey for year 1908.
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.
1075. Gowganda Mining Division, 1908. W. H. Collins.
1035. Coal Fields of Manitoba, Saskatchewan Alberta, and Eastern British Columbia, 1908. D. B. Dowling.
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

THE COST OF MINING

AN EXHIBIT OF THE RESULTS OF IMPORTANT MINES THROUGHOUT THE WORLD.

By JAMES RALPH FINLAY. - - *415 pages, 6 x 9, illustrated, $5.00 net, postpaid*

MINING costs and the factors governing their determination are of prime importance to every mining engineer, stockholder and superintendent.

This is the first important attempt to investigate them and to give a broad view of the economics of mining. It is based in part upon mining reports and in part on special investigations and information on costs that have not heretofore been made public.

A careful analysis of these data has hitherto been lacking and out of the recent world-wide discussions on this subject has grown the inspiration for this work. The author has had twenty years' practical experience and aims to give here a rational perspective of the business of coal, iron, lead, zinc, copper, gold and silver mining, exhibiting facts in their proper proportion.

It shows the inevitable influence on methods and costs of development of natural conditions, such as climate and degree of altitude, with their powerful effect on human life and effort; transportation, facilities for marketing the product, etc.

By means of detailed cost analyses based on the statistics in the reports of mining companies, the author places before the reader information covering practically the entire output of the world. The chapters on coal mining sketch the essential features of this, the simplest form of the industry. In iron much attention is given to the results and statistical history of the United States Steel Corporation, which accounts for 55 per cent. of the output of this country, The discussions of zinc and lead mining cover results obtained by companies typical of the operating conditions under which 80 per cent. of the American product is secured.

In gold and silver examples from all parts of the world are given in order that all classes of conditions may be included.

CONTENTS

I. Value of Mining Property.
II. Factors governing Variations.
III. Partial and Complete Cost.
IV. Statistics of Coal Production.
V. Cost of Mining Coal.
VI. Cost of Mining Lake Superior Iron.
VII. Occurrence and Production of Copper.
VIII. Lake Superior Amygdaloid Copper Mines.
IX. Conglomerate Copper Mines of Lake Superior.
X. Copper Mines on Fissure Veins in Montana Australia and Arizona.
XI. Various Copper Mines of Arizona and Mexico.
XII. Copper Mines in Various other Districts.
XIII. The Copper Mining Business in general.
XIV. Lead.
XV. Silver-Lead Mining.
XVI. The Cost of Silver-Land Smelting.
XVII. Zinc Mining.
XVIII. Occurrence and Production of Gold.
XIX Quartz-Pyrite Gold Mines.
XX. Cripple Creek, Kalgoorlie and Goldfield.
XXI. Silver Mining at Cobalt and Guanajuato.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

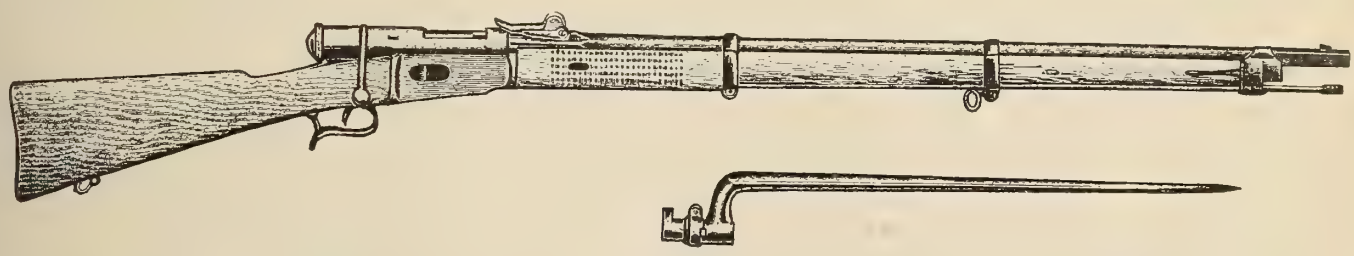
It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.



PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

A Great Chance to Buy a Great Rifle

IF IT COST a manufacturer $20.00 to make a certain rifle, and he offered it to you, guaranteed perfect, for less than $5.00, you'd hardly believe your ears, would you? Well, that's just what we're offering you—and here's the explanation. ¶ The Swiss Government, having lately decided to change the type of their army rifle, just took whatever they could get for the former kind—which was not very much for each rifle on account of the immense quantity they had to dispose of. And this is the rifle that we're able to sell at such a ridiculous price.

THE ACCOMPANYING CUT IS TAKEN FROM AN ACTUAL PHOTOGRAPH

This is one of the most accurate rifles ever used in Europe, and helped to make the Swiss a nation of sharp-shooters.

¶ It is a *repeater,* holding 12 cartridges in the magazine and one in the chamber.
¶ The *action* is the reliable military bolt type and works quickly and smoothly.
¶ The *barrel* is rifled and is sighted for long ranges.
¶ The front *sight* is open and the rear sight is adjustable for elevation.
¶ The *ammunition* is .41 calibre, and may be bought from us for $2.50 per hundred.

Complete with bayonet and cleaning rod, $2.95

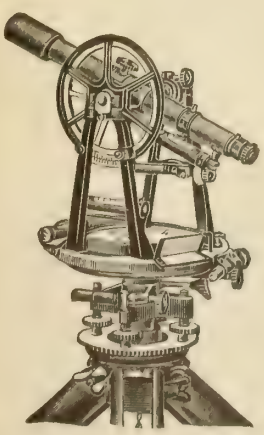
CANADIAN MINING INSTITUTE

NOTICE OF CHANGE OF ADDRESS.



The Secretary's Office and Library of the Institute have been removed to rooms 3 & 4, Windsor Hotel, Montreal, Que. Members visiting Montreal are invited to make use of the rooms for reading or writing purposes.
Office hours: 9.30 a. m., to 1.30 p. m. and 2.30 p. m. to 6.00 p. m.
The Secretary will also be glad to receive mail matter addressed to members in his care to the above address, and to forward same when required.

Springhill Coal

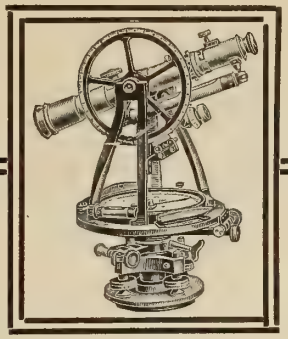
The Cumberland Railway & Coal Co.

Are prepared to deliver this well known Steam Coal at all points on the lines of G. T. R., C. P. R., and I. C. Railway and connections.

HEAD OFFICE
80 St. Francois Xavier Street, Montreal
Address P.O. Box 196

C. L. Berger & Sons

37 WILLIAMS STREET
BOSTON, - MASS.



SPECIALTIES:
Standard Instruments and Appliances for Mining, Subway, Sewer and Tunnel, and all kinds of Underground Work.

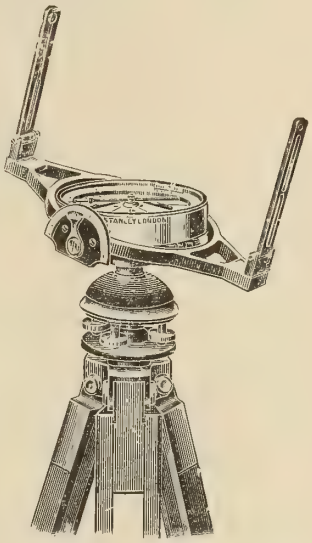
SEND FOR CATALOGUE.

RAMPART CEMENT

Perfectly Sound. Never swells or bursts.
Reliable for all purposes for which hydraulic cement is used.
Fineness 92 per cent. through a 200 mesh sieve.
Strength up to standard specification and permanent.
Used by the leading Mining Companies of the Maritime Provinces.

Sydney Cement Co., Ltd.
Rampart Brand
SYDNEY, NOVA SCOTIA, CANADA

K & E
Engineering Instruments



The superior design, high quality of material, workmanship and finish which characterize our Surveying Instruments, account for their use on nearly every important engineering enterprise.

When in the market for a new surveying outfit, we will be pleased to quote on your requirements, as we can furnish every requisite of the engineer for field or office.

Send for our Solar Ephemeris for 1910.
Our complete Catalogue sent free on request.

OPPORTUNITIES FOR MINING VENTURES AND INVESTMENTS IN CANADA.

Canada has derived much advertisement from her unequalled mines of asbestos, of nickel, and of silver. One effect of this has been to throw into the background many most interesting mineral areas that, on their merits, should command attention.

The magnitude and diversity of Canada's mineral resources can only be grasped by those who are constantly in touch with mining and prospecting in all their branches. To attempt to draw up an inventory is impossible. But it is appropriate to allude to a few of the sound ventures and investments that are open in unadvertised regions of the Dominion.

We shall preface our remarks with the statement that there is great need of more exact statistics and data regarding the markets for mineral products. Official statistics are meagre. The process of searching out these things is costly and wearisome to the individual. At present, however, it devolves upon each investor to do his own investigating.

Without considering geographical order, we shall proceed to enumerate several fields which, in our opinion, should prove profitable to investors.

Eastern Ontario, particularly the northern parts of the counties of Hastings and Frontenac, is dotted with small prospects, abandoned mines, and not a few paying mines. The accepted opinion as to the gold mines of this Province is that they are not payable. This has not been proved. From private reports that we have read we have formed the deliberate judgment that several of the gold mines can be worked at a profit. And, apart from any question of management, conditions have so improved that costs are no longer prohibitive. But gold is only one of a dozen possibilities. Feldspar, talc, corundum, marble, iron pyrites, and iron ore are being produced on a small scale. The beautiful decorative stone, sodalite, is found in workable quantities. Copper pyrites has been mined. The introduction of cheap hydro-electric power means net profits in many instances.

The gold mines of Nova Scotia, like those of Ontario, require systematic proving. In the opinion of not a few competent judges, the Nova Scotian mines as a rule can be made to pay if worked as nature intended them to be worked. Here, as elsewhere, it is essential that each property be examined on its own merits. This is all the more necessary as the history of the camps has not been properly preserved. The rich tungsten prospects, the gold-bearing antimony ores, the manganese deposits, the gypsum, all await the advent of well-directed capital. Although a small province, Nova

Scotia has been prospected only in the most irregular and unsystematic manner.

The Portland Canal district, in Skeena Mining Division, British Columbia, is rapidly coming to the front. Veins of gold-silver-lead and silver-lead-copper ores hold the promise of good returns. United States investors were early on the spot. The district is large and easy of access by water. Sheep Creek, the gold-milling camp in the Nelson district, has often been mentioned in these columns. Here the chances for those who know something about gold mining are good.

While in Quebec there is much for the investor, there is even more for the prospector. The copper and gold of the eastern townships have been only scantily exploited.

New Brunswick holds out vague inducements. Rich iron-ore deposits are being opened. Antimony, manganese, gypsum, oil and gas, and, possibly, gold should be looked into.

We have omitted mentioning the vast hinterlands of Ontario and Quebec; the tremendous stretch of territory in north-western Canada; the copper and antimony of Cassiar; the gold-quartz of the Yukon. We have not touched upon the coal of Alberta and Saskatchewan. We have confined our attention to easily accessible tracts, lying mostly in the settled portions of the Dominion.

It must always be borne in mind that there is no royal road to success in mining. In pointing out the general fact that good opportunities do exist practically all over Canada, we are giving expression to a conviction that is being strengthened every day. But it is necessary to repeat the assertion that money and time must be spent in investigating not only the deposits, but in investigating also commercial conditions, especially in reference to the market. Not many men are fitted to undertake such work. Other things being equal, it is probable that Canadian specialists, familiar with local conditions, can get the best results. This is true in dealing with minerals, or mineral products, that have a limited market. Some of the minerals mentioned above are marketable in the United States and in Europe. Some of them can be disposed of only in Canada. But in all cases the present market can be largely expanded.

PORCUPINE.

As usual, the discovery of a new gold district has caused an acceleration of the public pulse. Not since, almost fifteen years ago, Ontario went wild over gold in the Lake of the Woods region, has there been such a revival of local interest in the mining of that metal. Porcupine pervades and permeates everything.

And interest in Porcupine is not confined to Ontario. Montreal has taken a hand in the game, New York has asked for cards, and London has made a few side bets. Meanwhile, men and supplies are being hurried over the short winter trail at a tremendous rate.

Before uttering a word or two of warning, we wish to state that to the best of our belief the Porcupine discoveries have much to recommend them. Several prospects are promising. The superficial extent of a few of the bodies is unusually large. Rich pockets are not infrequently encountered. Altogether, the field is worthy of serious attention. This is all that any person is warranted in saying. On the other hand, no good can result from inflated newspaper reports. They may improve circulation, but they hurt the camp.

The fact that the first important discoveries were made just before snow fell precludes the possibility of properly estimating the potentialities of the region. Something will be learned from this winter's work; but certainly not enough to determine finally either the extent or the value of the ore bodies.

Meanwhile, since exact data as to the character of the new goldfield are almost entirely lacking, our provisional opinion must be influenced by the history of other more or less analogous occurrences. We shall disregard the past record of Ontario gold mining camps, a dismal record, and assume that Porcupine is unique, so far as Ontario is concerned,—a quite reasonable assumption. We shall also assume that the gold-bearing quartz will be found in very large quantities. Starting with these assumptions, and guided by the records of certain large gold-mining camps in other parts of the world, it is probable that success at Porcupine will mean the opening of large workings in low-grade ore.

Now, very few people understand what equipping and working a low-grade gold mine means. We shall not attempt to expatiate upon the subject here. But the kernel of the matter may be expressed thus: It may take years of time and millions of dollars to bring a low-grade gold mine up to the point where net profits can be realized.

Of course, "low-grade" is a term that is very loosely applied. Ore carrying $2.50 per ton in gold is undoubtedly low-grade. Ore assaying as high as $10 or $15 per ton may fall into the same category. We believe that the bulk of the Porcupine ore now exposed will range between these figures. In making this statement we are disregarding altogether high assay returns from picked specimens.

There may be a glorious future in store for Porcupine—or there may not. Larder Lake was "boomed" to death. Let us see that Porcupine gets a fair show.

GOVERNMENT POSITIONS.

The mining engineer or the geologist who accepts from a government an official technical position, accepts also a large, though not clearly defined, moral obligation.

Probably in no position are there more opportunities for graft and malversation than in an administrative governmenal mining billet. The low salaries

usually paid heighten the temptation. And temptation comes in particularly inviting and insidious forms.

The government mining official is so placed that he gets early news about new discoveries, promising developments, and all the constant changes that make up the history of prospecting and mining. Since he is a public servant, he must regard all such news as absolutely confidential until it can be made public through official channels. His first obligation is to the public.

But there are always those who are keen to pay a price for early and exclusive tips. Requests for such tips may come from persons of great political power. Refusal on the part of the official may lose him his place, or may create dangerous enemies. But to magnate, friend, or foe, the answer must always be the same—a blank, unqualified refusal.

Added to unyielding integrity the official in question should possess an uncommon amount of discretion and a wide knowledge of commercial mining. In more than one Canadian province he must combine the functions of technical adviser, explorer, geologist, information bureau, inspector, and "glad-hand" artist. In fact, he is expected to do the work of a regiment for the pay of a private.

In all this there is evidence of needless stupidity. A province that employs a good technologist to look after its mining interests, and does not give him a free hand and an adequate staff, is throwing away time and money. The most efficient technologist is of little use if he has to waste half his time in attending to office routine that could be done much better by a young clerk. He can only prove his value with the aid of a suitable appropriation and a corps of assistants.

To drive home these obvious truths we may add that there is not a mining province in Canada that would not be fully justified in spending ten times its present appropriation in exploiting the mineral lands within its boundaries. This is equally true of the Federal Government.

"THE GIDDY HARUMFRODITE."

Two peculiar instances are on record that illustrate the unwisdom of permitting special interests to dominate large coal mines. In its early years the Dominion Coal Company was saddled with a contract whereby it supplied the Everett Gas Company with coal at a price too low to leave any margin of profit. The contract was arranged by a person who had very large holdings in both companies.

During 1908 the dividends of the Crow's Nest Pass Coal Company were reduced by almost 50 per cent. In 1909 no dividends were paid. This decline coincides with the assumption of the control of the collieries by the J. J. Hill interests. The majority of the Crow's Nest Pass stock has been for two years in the hands of the Great Northern Railway and the Granby Consolidated Smelting Company.

This is not an age of Christian charity. Mr. J. J. Hill and his associates, in buying their way into the Crow's Nest Pass Coal Company, were animated by no altruistic motives. Their quite obvious desire was to obtain cheap coal and coke. If they can do this without disregarding the minority shareholders, all well and good. At present it seems that they are doing something else.

A GOOD EXAMPLE.

Most praiseworthy is the spirited resolve of the Daily News, of Nelson, B.C., to spare no pains in giving the public an early and authoritative review of British Columbia's progress during the past year. Its Annual Review number, January 5th, is excellently prepared. The section that deals with mining comes from the pen of Mr. E. Jacobs, that indefatigable and accurate journalist. British Columbia is fortunate in possessing such an enlightened paper as The Daily News, and such a competent observer and critic as Mr. Jacobs.

EDITORIAL NOTES.

Silicious ores, carrying low percentages of finely divided chalcopyrite, are particularly difficult to concentrate without undue loss. Several deposits of this kind have been worked in Ontario and in British Columbia, almost uniformly without commercial success.

The late Dr. Ludwig Mond, throughout his life an unremitting worker, found enough leisure to cultivate a hobby. He was extremely fond of oil paintings, and he succeeded in gathering together one of the finest private collections of pictures extant, mostly the work of Italian artists.

We must congratulate our New York contemporary, **The Engineering and Mining Journal**, upon its improved appearance. The changes in the cover-design have not destroyed its distinctiveness; the paging is much more convenient; and the general make-up is brighter and more attractive.

The cost of producing copper at the plant of the British Columbia Copper Co. was reduced during November, 1909, to 7.35 cents per pound. The cost per pound during the preceding month was 8.8 cents.

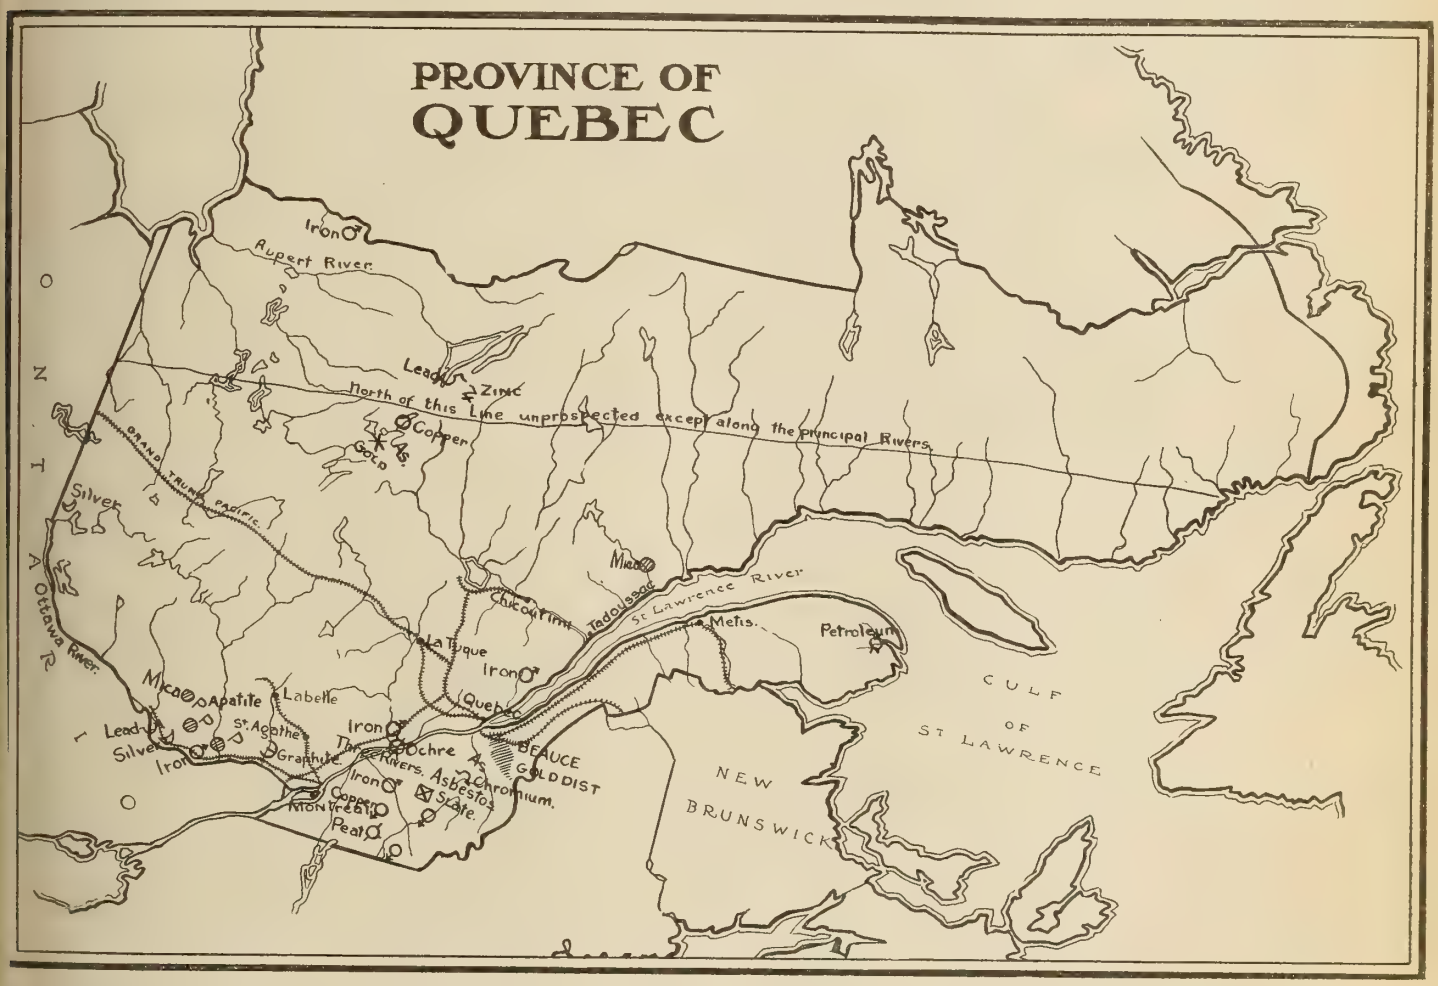
LEGAL NOTES.

Judgment was given at Vancouver on December 17, in the damage case of Cope vs. Wellington Collieries, before Mr. Justice Clement and a jury, for the plaintiff, and the damages awarded amounted to $2,400, with costs. The plaintiff sued for damages for the death of his son in an explosion in the collieries at Extension, on January 27th, 1909. Evidence was concluded last night at 5.30 o'clock, and the jury gave its verdict in less than half an hour. Messrs. McNeil & Bird appeared for the plaintiff, and Messrs. C. V. Bodwell and M. Hill for the defendant company.

THE YEAR IN THE PROVINCE OF QUEBEC.

By H. Mortimer-Lamb.

Although as yet production returns are not available, there can be little question but that Quebec's mineral yield for the year will represent a substantial gain over that of 1908. The twelvemonths, in fact, has been a period of notable industrial activity and progress, evidence of which, however, will only be partially disclosed by the statistical records.



The most important event of the year, having reference to the future of the industry in the Province, was the repeal by the Provincial Legislation in April last of the Quebec Mining Act of 1892, and the passage of a new law, the provisions of which are likely to stimulate to an eminently greater degree exploration and legitimate mining endeavour in this field. The old regulations, which, by the way, were based on ancient French law, were radically dissimilar in principle to those in force in other Provinces of the Dominion, where the aim of legislation in general has been primarily to promote and encourage prospecting and mineral development. The Quebec Mining Law, on the other hand, while apparently liberal in intention, was more favourable to the speculative acquisition and idle holding of large tracts of territory than conducive to bona-fide endeavour; and, in consequence, many are inclined to attribute the tardy progress in the development of the mineral industries of the Province in recent years—a tardiness the more apparent when contrasted with the rapid and great advances in other sections of the Dominion—to this cause alone. Whether or not this contention has any foundation in fact yet remains to be proved; but since geologists are agreed concerning the economic potentialities of the area, and it is, moreover, a well-known fact that there exists in the world no finer class of prospectors than the French-Canadian, it is puzzling to account for the very moderate growth of Quebec's mining industry, unless the explanation of unsuitable or defective laws be accepted as adequate. The amended regulations meanwhile go into force with the new year, and it will be interesting to note to what degree they will affect or influence conditions and activity during the coming prospecting season. The disposition of the present Provincial Government, and especially of the Minister who represents the mining interests, to promote the welfare of the Quebec industry is also apparent in the projected reorganization of the Mines Department. The last incumbent of the office of Superintendent of Mines was most inadequately paid for his services. He was appointed to the post very many years ago, at a time when mining in the Province was of little account. His salary was small and although the duties of the office steadily grew more burdensome, the pay of the Inspector (as was until lately this officer's designation) was not commensurately increased. Finally, in July last at the close of twenty-eight years' service Mr. Obalski resigned the Superintendentship in order to engage in private practice as a consulting mining engineer in Montreal. Meanwhile it is satisfactory to learn that, after some little delay and difficulty, a worthy successor to Mr. Obalski has been found in Mr. T. Denis, a distinguished officer of the Dominion Mines Department, who only a week or so ago accepted the vacancy and will shortly assume the duties. It is also understood that conditions under which Mr. Denis accepts direction of the office are much more favourable than formerly, and that he will be given every facility and assistance in modernizing the Department and in extending the scope of its efficiency and usefulness.

Asbestos.—However one may deplore the greed of promoters as exemplified in the gross over-capitalization of the Asbestos Mergers, and regret that a fine industry should be saddled with so unfair a handicap, it must nevertheless be admitted that the immediate effect of these promotions has been to create remarkable activity throughout the Eastern Townships. Never was there such a busy time-heavy production, new mills going up everywhere, others projected, extensive mineral development under way, and territory over-run by prospectors. Thus at the moment no less than twenty-six cyclones are being installed in the several new mills, and these should all be in readiness for operation within the next few months. As to tonnage shipments of asbestos and asbestic during 1909, there is some difference of opinion whether or not any considerable increase over those of 1908 will appear in the returns since several of the important producing properties have been accumulating or adding to their stocks and have accordingly restricted their actual shipments. Mr. Obalski, however, is of the opinion that the shipping returns will show an increased tonnage output of from fifteen to twenty per cent. for the year, a good enough record in itself but likely to lose in significance when in turn it is compared with what may be expected during 1910.

Referring most particularly to the year's developments in the asbestos area, mention should first be made of the re-opening of a mine near Thetford, dormant for nearly fifteen years, formerly owned by the Thetford Mining Company, but since acquired by the Jacobs Asbestos Company. Here eminently successful development operations have been undertaken, the results justifying in fact the erection of a mill which is now in course of construction. Other new properties also undergoing development in this vicinity are the Clarke, near the Poudrier Road, owned by a Montreal syndicate, and the Demers, situated a mile to the east of the town of Thetford. All the large producing Thetford mines have, of course, been in full operation, night work having been inaugurated at the Amalgamated Asbestos Corporation's King Brothers' Mine here, search lights being employed to give illumination in the pit—an innovation, which by the way is also being introduced by the Asbestos & Asbestic Company at Danville. One important result of the promotion of the Black Lake Consolidated was the re-opening of the Union and the development of the adjoining property, the Southwark; and a mill, which it is hoped will be ready for operation in the spring, is now being erected to serve both mines. Prospecting work in this district has also been prosecuted by the Imperial Asbestos Company.

In East Broughton, a very complete mill has been erected on the Frontenac, while the Beaudoin and Audet Company has opened mines at Robertson. It is also interesting to record that the Berlin Asbestos Company, operating near Broughton, having constructed, regardless of expense, four miles of branch railway to connect its property with the Quebec Central, and likewise erected a mill, is now about to search for asbestos.

At Danville, a new mill has been recently completed, and is now in operation, and with this additional equipment the Asbestos and Asbestic Company is in a present position to handle between fifteen hundred and two thousand tons of rock daily. In the vicinity of Danville, prospecting has been active, a small power plant having been installed for the development of one prospect in the 9th Range of Cleveland, while development has been in progress on an adjacent property in the 8th Range, and on a third property in the 5th Range of Shipton. The Champoux property, near St. Adrien, 6th Range of Ham, has been acquired and is being developed by a Montreal syndicate near Morceaux. Operations have been restricted to development on the Chicago and Charpentier, and on an adjoining lot to the south west. The only at all depressing intelligence, if it be considered as such, is that after lying idle for the last two years or so the plant ot the Asbestos Mining and Manufacturing Company's mine at Crysotile, Wolfstown (formerly known as the Peters Mine) has been dismantled and sold. To sum up briefly, prospecting and development have been general throughout the asbestos area from Brome to the Vermount.

Copper.—There are those who confidently believe that one of these days, and possibly at no very distant day, Quebec, or rather the eastern townships, will become contributors to the copper production of Canada. As a matter of fact, a very fair output has been maintained by one or two mines for many years past, and it is not generally realized that, taking into consideration the amount of capital actually invested, these properties have returned to their owners a larger percentage of profit than any copper mines operating in the Dominion. With the exception of perhaps three properties, the Eustis, Nichols and Naughton, there has been practically no attempt to systematically exploit the resources of the district; and this is the more regrettable since the surface indications are so generally promising, and the economic conditions so exceptionally favourable for the establishment of a flourishing industry. Nevertheless, as the result largely of the introduction of more modern methods of mining at the Eustis, it is expected that the past year's copper production will show an increase of perhaps a hundred per cent. over the 1907 returns—and this notwithstanding that the Nichols mine was operated for only part of the year. The Eustis Company meanwhile is developing a new property, adjoining the Eustis, and known as the Hepburn, while development has also been actively prosecuted on the Suffield and Marrington, owned by Mr. A. O. Naughton; and on the Lake Memphremagog, a prospect owned by Mr. G. E. Smith. Elsewhere, a copper prospect near Weedon, in the vicinity of Quebec, is being exploited, while also development is reported to have been undertaken on copper properties located on the north shore of Chaudiere River.

Gold.—The revival of placer mining activity in the valley of the Chaudiere is worthy of special notice, and the result of developments now proceeding is awaited with very considerable interest. As is well known, the Chaudiere was twenty years or so ago a very rich and

active gold-producing district, but after yielding well for some time operations were finally abandoned. A Montreal syndicate, however, acquired in 1909 the mining rights over 72,000 acres of the Seigneury Regaud de Vaudreuil, in Beauce County, intending to prospect for copper. Effort in this direction was not successful, but during the late summer auriferous gravel, which promised well, was discovered on a branch of the Gilbert River. Operations were commenced on October 1st, with the employment of a force of thirty-five men, who have been engaged in sinking to and drifting on bed rock. The gold is found lodged in the crevices of the bed rock—a black-clay slate in the gravel for a distance of three feet immediately overlying the bed rock, and also in a band, about four feet thick, of over-burden. The bed rock is said to yield values averaging $4.95 per cubic yard, and the over-burden 77 cents. At the beginning of December, about 4,800 square yards of pay ground had been developed here, but since then additional territory of equal value has been opened. The syndicate has also made successful tests of the gravels of the La Plates River, at a spot approximately three-quarters of a mile from the confluence of that stream with the Chaudiere. The gravel from this spot which is presumed to be the locale of an ancient river channel, has yielded returns of from $3.22 to $80.82. The conditions for hydraulicking are moreover exceptionally favourable, since abundant water from the neighbouring high falls may be relied on to give an ample supply under pressure to carry on continuous operations during the working season. Nuggets have also been taken this year from ground on the Ruisseau des Meules, which locality promises well, although when formerly worked much difficulty was occasioned by quicksands. The syndicate, meanwhile, is engaging the services of an expert gold-gravel engineer from California, and propose to commence actual mining operations in the spring.

There is little to record in respect of gold quartz developments. A stamp mill, however, has been erected at Megantic, while some prospecting and other activity is reported from the northern section of Pontiac, where on the Union Abitibi mine a ten-stamp mill has been erected.

Chrome and Iron.—The chief event during 1909 in connection with the chrome industry was the absorption of the Dominion Chrome Company and of the Black Lake Chrome and Asbestos Company by the Black Lake Consolidated. Otherwise, the year so far as this industry is concerned has been somewhat featureless. Production will probably show a decrease. A plant, however, is now being installed at Coleraine to utilize the Behrend process of concentration on a larger scale than has yet been attempted.

The utilization of the black magnetic sands from the north shore of the St. Lawrence has long been a subject of discussion. Matters have recently been somewhat advanced by experimentation. Shipments of the sands for this purpose have been made to Niagara and elsewhere during the year, but results as yet have not been made known.

Operations by the Canada Iron Corporation at Radnor and Drummondville have been conducted as usual, and it has been announced that the company proposes to establish a foundry at Three Rivers.

Other Minerals.—A new discovery of graphite is reported to have been made at St. Jovite, situated 60 miles north-west of Montreal, on the Montreal and Nomining branch of the C.P.R. The property has been acquired by a syndicate that is opening it and installing machinery. Some of the flake material, in which the deposit is rich, has already been marketed in the United States. No important developments are reported from Buckingham.

A first shipment of some 200 tons of magnesite was made in 1908 from a property near Calumet, Granville County. This production was increased in 1909, while the mine has also been extensively developed.

Excellent reports concerning the condition of the cement industry are received, and a largely-increased production for 1909 is assured, the three mills having been in continuous operation and producing at the rate of 5,000 barrels daily.

MINING IN BRITISH COLUMBIA IN 1909.

A Review of the Year's Work and Progress.

Written for the Canadian Mining Journal by E. Jacobs.

The aggregate value of the mineral production of British Columbia for 11 years to the end of 1909 is nearly $350,000,000. Allowing that the accompanying estimate for the year 1909 shall be proved by the revised returns to be approximately correct, the actual aggregate will be 347,804,000, or but $2,196,000 short of the larger total first mentioned. Of this aggregate, gold represents $126,317,000, silver $30,081,000, lead $23,298,000 copper $55,242,000, miscellaneous metals $991,000, coal and coke $102,782,000, and building materials, etc., $9,093,000. The proportions of value are metalliferous minerals $235,929,000, and non-metalliferous $111,875,000.

The value of production in 1909 is estimated at $24,426,500, as shown in some detail in the tables herewith. As the yearly average value for the four years 1905-1908 was $24,294,000, it is evident that notwithstanding the comparatively low average prices of silver, lead and copper, production last year was well maintained; in fact showed an increase in quantity on the whole. For the better appreciation of the increase in value it should be borne in mind that the prices at which metals have been calculated for the years 1909 and 1908 respectively, are as follows, those in brackets showing where there was any difference between the two years: Gold, placer, $20 per oz.; gold, lode, $20.67 per oz.; silver, 49 cents (50.2 cents) per oz.; lead, 3.8 (3.78) cents per lb.; copper, 12.9 (13.2) cents per lb.; zinc, 5 cents per lb.; coal, $3.50 per long ton; coke, $6 per long ton. Silver is less 5 per cent., and lead 10 per cent., of the New York average market prices, as shown by "Engineering and Mining Journal" quotations for ten months. Prices for coal and coke are those ruling generally in the Province.

QUANTITY AND VALUE OF MINERAL PRODUCTS FOR 1908 AND 1909.

MINERAL PRODUCT	CUSTOMARY MEASURE.	1908.		1909.	
		Quantity.	Value.	Quantity.	Value.
Gold, placer,	Ounces.	32,350	$ 647,000	30,000	$ 600,000
Gold, lode,	Ounces.	255,582	5,383,880	250,000	5,167 500

Reviewing separately the production of the different minerals, the following comment is submitted:—

Gold.—There seems to have been a general decrease in the production of placer gold, the two larger producers of this metal—Cariboo and Cassiar districts—both showing a smaller yield. The estimated decrease in the former is about, $10,000 and in the latter $27,000. Nearly all the lesser placer gold camps were also short as compared with 1908, so it is probable the general shortage is attributable to a restricted supply of water, with a resultant shorter period of gravel washing operations. In Cariboo provision is being made for extended operations during the 1910 season, chiefly on the properties of John Hopp, situated near Barkerville, and the leases held by Philadelphia people, represented by Howard W. Dubois, who are constructing a 20-mile ditch and flume from Swift River to the Quesnel Forks neighbourhood, preparatory to hydraulicking on a large scale.

The Guggenheim hydraulic gold properties in British Columbia, in the Quesnel Forks and Atlin camps respectively, were not worked during the season on the large scale that had been expected, so those added little or nothing to the year's total yield of placer gold.

The decrease shown in the production of lode gold was largely in Rossland camp, a result of the suspension of production at the Le Roi mine, pending the carrying out of systematic exploration with a view to finding new ore bodies of a payable grade in the deeper levels of the mine. The Centre Star group of the Consolidated Mining and Smelting Company of Canada, Limited, made a slightly larger production of gold than in 1908,

while the Le Roi No. 2 produced in 1909 from its Josie mine, about as much as in the year immediately preceding. There was no change of importance among the smaller mines in Rossland camp.

An advance was made in Nelson district, the year's increase having been about 12,000 oz., mostly from Sheep Creek camp, in which several mines are being developed with promising results. This camp is expected to become one of the important lode gold producers of the Province, with at least half a dozen mines yielding profitable returns. At Ymir the only mine that contributed to the district's total for the year was the Yankee Girl, operated by a New York company, organized during the year.

The Boundary district, as in earlier years, made a fairly large production of gold, which in the mines of that district is in association with copper. It is noteworthy that the greater part of the lode gold produced in British Columbia is from ores that are smelted, there being only two mining divisions in which gold ores are milled to any considerable extent, viz., in Nelson and Osoyoos. The Hedley Gold Mining Company's Nickel Plate mine is in the latter division; this was sold during the year to the organizers of that company, so the Yale Mining Company, which was one of the late Marcus Daly's companies, is no longer mining in the Similkameen country of British Columbia. Arrangements are being made to do much development work in 1910, following extensive diamond drilling done in 1909. Additions are being made to power plant at both the mine and the 40-stamp mill; at the mill re-grinders and filter press are being added to complete the cyaniding plant.

Developments on Texada Island are resulting in an increased output of lode gold from two or three mines there, the gold occurring in an ore also containing silver and copper to an extent which admits of a return being received from the smelter of about $20 per ton, for first-class ore, after deduction of freight and treatment charges.

Silver.—A production of approximately 3,000,000 oz. of silver is an advance of 368,000 oz. on the output of 1908. Nearly half of this increase was made in Ainsworth camp, in West Kootenay, the Blue Bell mine on Kootenay Lake, contributing about 38,000 oz. more than in 1908; the Whitewater and Whitewater Deep mines, situated between that lake and the Slocan mining division, adding about 58,000 oz. to its 1908 total, and the various other mines in the division together making up about 75,000 oz. of the total increase. In Slocan division the Richmond-Eureka mine, owned by the Consolidated Mining and Smelting Company of Canada, Limited produced 197,000 oz., which was 37,000 oz. more than in 1908; while the Van Roi, an English-owned property, produced about 38,000 oz. more than in the year previous.

The production of East Kootenay mines was nearly 100,000 oz. less than in 1908, attributable mostly to the Sullivan group not having been worked, and as to the remainder to a smaller yield from other mines in the district. Several mines in Nelson division contributed to the total decrease, as also did the Silver Cup, in Ferguson camp, Lardeau, and the Marble Bay and Cornell mines, on Texada Island. The finding of much native silver in bornite ore at between 900 and 1,000 feet depth in the Marble Bay mine was one of the most interesting features of the year's mining in the Coast district, the more so since the first-class ore also contained about $10 in gold to the ton.

The average silver content of the ores of the big Boundary mines appears to have been of slightly lower value than in earlier years. The difference per ton was not considerable, but the aggregate silver content of the total tonnage—nearly 1,600,000 tons— mined and smelted was distinctly noticeable.

The outlook is that next year there will be a further increase in the quantity of silver produced in the Province, for substantial progress made in 1909 in the Ainsworth and Slocan districts may be expected to be maintained, while better results are looked for in East Kootenay. Boundary mines will increase their tonnage also, and in the Coast district new mines in the Portland Canal district will begin producing. British Columbia's record of silver production was made in 1897, with an output of 5,473,000 oz., while that of 1901 was 5,151,000 oz.

Lead.—The increase in production of this metal was about 2,804,000 lbs. It is probable the revised returns will show the year's total to have been in excess of the estimate of 46,000,000 lbs. possibly by another million pounds. In past years production has ranged as high as 63,358,000, which was the total for 1900, the next highest year's total having been that of 1905, with 56,580,000 lbs. The stimulating effect of the bounty paid by the Canadian Government on lead produced in the Dominion can easily be seen when the statistics of production during recent years are examined. Production for 1903, the year immediately preceding the granting of the bounty, had fallen to 18,089,000 lbs, but since 1904 it has not in any year been lower than 43,000,000, while it has gone up to 56,580,000, which was the quantity produced in 1905. The amount of bounty paid is determined by the price of lead in London, it being on a sliding scale, commencing when the quotation is about £17 and increasing to 75 cents per 100 lb. of lead in the ore when the London price becomes lower, so as to ensure to the Canadian producer a minimium price of £17 per ton inclusive of bounty. As London quotations ranged from £12 3s 9d to £13 15s during 1909, the full bounty was paid to Canadian producers.

East Kootenay produces more than half the lead mined in British Columbia. Its total for 1909 was less by between 3,000,000 and 4,000,000 lb. than that of 1908, partly owing to a suspension of production at the Sullivan Group mine and partly to a decreased output of this metal from the St. Eugene and North Star mines.

The output of mines in Ainsworth mining division was doubled, the figures being about 5,000,000 for 1908 and in excess of 10,000,000 lb. for 1909. More than half of this increase was made by the Blue Bell mine, with a production of about 6,466,000 lb. in 1909 as against 2,600,000 lb. in 1908. The Whitewater and Whitewater Deep mines produced about 3,355,000 lb., as compared with 2,000,000 in the preceding year. The Cork mine, on the south fork of Kaslo Creek also contributed to this increase, though in much smaller degree.

Slocan mines did not produce as much lead as in 1908, the falling off having been approximately three-quarters of a million pounds, the chief losers being the Rambler-Cariboo and Standard mines, both with a materially reduced production. Richmond-Eureka and Van Roi both considerably increased their output, the former with a total of about 1,357,000 lb. to the extent of approximately one-third, and the latter from 594,000 lb. in 1908 to 1,788,000 lb. in 1909.

In Nelson division the Yankee Girl, at Ymir, was a new producer, with between 300,000 and 400,000 lb. to its credit, while the Iron Mountain Company's Emerald mine, situated near Salms, advanced its production from about 400,000 lb. in 1908 to 764,000 in 1909. The La Plate, on Rokanee Creek, near Nelson, formerly pro-

ducing silver-lead in considerable quantity, was idle all the year.

Work has been resumed on the Sullivan group, so East Kootenay may be expected to have shortly the benefit of production from that mine.

Incidentally, it may be mentioned here that the Consolidated Mining and Smelting Company of Canada, Ltd., during 1909, increased the lead smelting capacity of its works at Trail, also enlarged its electrolytic lead refinery. Two lead stacks have each an average smelting capacity of 150 to 170 tons per day, which is more than sufficient to keep the refinery supplied with all the lead bullion it will be able to deal with when enlargements now being made shall be completed. So generally only one will be kept in operation. Steel water jackets have been substituted for iron in these two furnaces; the number of tuyeres increased to 22; a 50-ton bullion pot has been installed, thus admitting of the molten lead bullion flowing continuously from the stack, instead of being tapped off at intervals; and provision has been made for moulding the lead into anodes at the furnace instead of re-melting it and moulding them in the refinery. An improved mechanical feed has been installed at the furnaces. The number of Huntington-Hoberlin circular roasters for lead has been increased to seven and of converting pots to 15. The lead refinery has been enlarged to a daily capacity of about 120 tons of refined lead. The number of electrolytic tanks is now 596, these being housed in a building 600 feet in length.

It is noteworthy that the gradual building up of a lead smelting and refining industry at Trail has resulted in the establishment in Canada of three lead corroding plants—two in Montreal, Que., and one in Vancouver, B.C.—and a lead pipe and shot factory in Vancouver. The market in Canada for lead is expanding, but it is not yet sufficiently large to absorb all the lead made at Trail, consequently a considerable quantity is still shipped to the Orient and some to Australia.

Copper.—Returns obtained to date indicate a decrease in production of copper in 1909 as compared with 1908 of about 6,274,000 lb. It is considered probable though that when the official returns shall be received it will be found that the actual output has been from 1,000,000 to 2,000,000 lb. more than the quantity included in the accompanying estimate. Of the present estimated decrease, about 1,500,000 lb. is directly traceable to the suspension early in the year of production at the Le Roi mine, Rossland. There was, also, a comparatively small decrease in the production of copper by the Consolidated Mining and Smelting Company's Centre Star group, in the same camp; but this was in part compensated for by an increase in that of the Le Roi No. 2 Company's Josie mine. The small mines of Rossland camp did not contribute any quantity of copper worth noting.

In the Boundary district the Granby Company's mines led with a production estimated at between 23,000,000 and 24,000,000 lb. Those of the British Columbia Copper Company with only about 6,500,000 lb. show the effect of three months' idleness consequent on a strike of miners at the collieries from which this company usually obtains its supply of coke for smelting. The result is a considerable decrease in the quantity of copper produced by that company. On the other hand, the Consolidated Company's Snowshoe mine, with 3,775,000 lb., appears to have made a gain of about 2,500,000 lb. as compared with 1908. The Dominion Copper Company, which made a small production early in 1908, did not in 1909 send any ore from its mines to the smelter.

Comparatively big tonnages and low mining and smelting costs are prominent features of the copper producing industry of the Boundary district. The Granby Consolidated Mining, Smelting and Power Company, in its last annual report for its fiscal year ended June 30th, 1909, stating its costs, including all expenses, at $3.20 per ton of ore, which, after deducting the value of the gold and silver contents of the ore, made the cost of producing copper ten cents per pound. The manager reported the metals extraction for the year to have averaged 21.81 lb. of copper, 0.2724 oz. of silver, and 0.0434 oz. of gold per ton of ore.

The Granby Company lately completed the improvements to its smelting plant that were commenced in the previous year. The maximum treatment capacity of the smeltery is now about 4,500 tons of ore per diem, as evidenced by a recent full week's run giving an average of 560 tons per day per furnace for seven furnaces then in blast. The eighth enlarged furnace has since been blown in. The British Columbia Copper Company's smelting and converting plant being quite modern and only in use a comparatively short time, was not changed in 1909. Enlargements of two of the three 700-ton blast furnaces are to be made next year, in order to provide for the bigger tonnage of ore to be available when railway connection with a mine the company has opened in Wellington camp, Boundary district, shall have been completed; also for ore from the New Dominion Copper Company's mines, which it is stated will be treated at the B. C. Copper Company's smeltery. There does not appear to be any probability of New Dominion Copper Company's smelting works at Boundary Falls being used again.

On the Coast, too, preparation has been made for smelting a larger tonnage of copper ore, the Tyee Copper Company having installed a second blast furnace at its works at Ladysmith, Vancouver Island. There was no production of copper ore on Vancouver Island in 1909 worth mentioning, but the Tyee Copper Company kept its works operating on ores from other parts. During twelve months ended August 31st, 1909, approximately 45,000 tons of ore were smelted at these works, and matte containing about 3,500,000 lb. of copper was produced. This was the largest production of copper by this company in any similar period since the fiscal year ended April 30th, 1905. Besides that from mines in the British Columbia coastal district, ore was received from as far north as Latouche, Alaska, and south as Salina Cruz, Mexico. The new furnace, installed in 1909, is 48 x 160 in. at the tuyeres. Its capacity is estimated at about 12,000 tons of ore per month.

Work has been continued at the Britannia mine, on Howe Sound, and latterly about 100 men have been employed at mine and mill. Extensive exploration of the enormous ore bodies occurring in the mine has been in progress all through the year, but no regular production of ore has been attempted. Some known ore bodies have been found to carry a considerable percentage of zinc, so for the purpose of determining in a commercial way whether the iron and copper can be separated from the zinc, a roaster, cooler, and Wetherill magnetic separator have been installed. At the mill, which has been re-modelled, the improvements made have been with the object of bringing its capacity up to 500 tons per day. Experimental work in saving the chalcopyrite contained in the highly silicious gangue characteristic of Britannia ore is being continued. There is little probability of active production in the near future, the

present intention being to determine definitely both the approximate tonnage of ore available and the best means of preparing it for smelting. The work being done at the Britannia is most important and valuable to the copper mining industry of the lower coast of British Columbia, where there is much ore carrying excess of silica.

On Texada Island, the development of a comparatively large shoot of bornite ore of generally high grade, occurring in the Marble Bay mine, has been continued with much success. The copper runs high in the sorted ore and even when a large proportion of second-grade ore was shipped the average return in copper from between 11,000 and 12,000 tons was 4 per cent. A neighbouring mine, the Cornell, reports an average copper value of 6.2 per cent. from 11,000 tons of ore, and this beside gold and silver to the value of about $17 per ton.

In the northern part of the British Columbia coastal district there is much promise of a substantial production of copper being established ere long. Among other new properties recently officially reported on by Mr. Herbert Carmichael, assistant provincial mineralogist, are the Red Cliff, distant about 20 miles from the head of Portland Canal, and the Hidden Creek group, on Observatory Inlet, a branch of Portland Canal. On one of the Red Cliff group, Mr. Carmichael found ore some 8 ft. in width. Bands of ore in the mass, 5 to 8 in. thick, were found to contain copper from 6 to 18 per cent., together with gold and silver up to $37.00. This official also reported as occurring on the Hidden Creek group a large exposure of ore which "has been cleared off to a large extent by surface stripping and shows a height of 300 ft. of mixed pyrite and chalcopyrite ore, carrying 4½ to 5 per cent. copper." The establishment of a smeltery in the vicinity is proposed.

Of the numerous mineral claims on Moresby Island, of the Queen Charlotte group, on which ores containing more or less copper have been found, few have shipped any considerable quantity to the smeltery, so that the commercial value of the ore has not yet been proved.

Iron and Zinc.—Iron mining in British Columbia, at no time of great importance, has been practically at a standstill during the last two or three years. There have been many enquiries relative to the Puget Sound Iron Company's large deposit of iron on Texada Island, and the property has been bonded by some United States men, but no steps have yet been taken by them in the direction of mining the ore. In past years about 30,000 tons of this ore were shipped to Puget Sound, Wash., and smelted in a charcoal furnace erected at Irondale, near Port Townsend.

A company has been organized with the object of establishing iron and steel works at or near Vancouver or New Westminster, the latter within 20 miles of the mouth of the Fraser River, but the plans of those in charge of this enterprise are not yet matured.

There has been more activity during 1909 in connection with the mining of zinc than for several previous years. Zinc has been produced commercially at four or five mines, while at others tailings from silver-lead concentrating plants are being stored for treatment later, when zinc separating appliances shall have been provided. The largest producer of zinc in British Columbia is the company owning the Lucky Jim mine, in the eastern part of Slocan district; much of the crude ore from this mine runs 52 per cent. zinc, so it is shipped without concentration or separation treatment. The Whitewater and Van Roi mines, the former in Ainsworth mining division, and the latter in western Slocan, both make a zinc concentrate. The Whitewater shipped during the year, 4,360 tons of zinc concentrate averaging approximately 15 oz. silver per ton and 42 per cent. zinc; the Van Roi made about 1,400 tons of similar concentrate assaying about 44 per cent. zinc and 50 oz. silver per ton. The Ruth, at Sandon, also makes a zinc concentrate from its silver-lead-zinc ore; it shipped 655 tons in 1909. The ore of the Blue Bell contains much zinc, but so far no production of the metal on a commercial basis has been made at this mine.

A group of mineral claims on Pingston Creek, opposite Haleyen Hot Springs, on which there is a large surface showing of zinc ore, was lately bonded by New York men who are commencing the development of this property.

Coal and Coke.—The production of coal and coke in the Province in 1909, it seems quite safe to assert, was the largest of any year since coal mining was commenced in British Columbia. Owing to non-receipt of the production figures of one of the larger companies, this may not be stated quite positively, but it appears reasonable to estimate the gross output at nearly 2,500,000 long tons, and the net at nearly 2,000,000 tons. However, to be on the safe side in making up the accompanying estimate, the net production, that is after deducting the quantity of coal made into coke and valued as such, has been placed at 1,940,000 long tons. Of the gross tonnage something like 1,450,000 tons were produced in what is officially known as the Coast coal mining district (Vancouver Island about 1,380,000 and Nicola 70,000 tons) and the remaining 1,050,000 tons in the Crow's Nest district, in south-east Kootenay. Deducting about 450,000 tons made into coke, an estimated net tonnage in excess of 2,000,000 tons remains. Whether this estimate will prove somewhat too high or not will be determined only by receipt of the official figures of production, but in any case the over-estimate if there be one, will not be large. The nearest approach to this tonnage of coal was that of 1907, when a net production of 1,800,067 tons was officially recorded. That year, however, the quantity of coke made was only 222,913 tons as compared with an estimated production of 277,000 long tons in 1909. The highest previous record tonnage of coke was in 1905, when it was 271,785 tons. It is quite probable, therefore, that the production of both coal and coke in British Columbia in 1909 was larger than in any previous year.

While the suggested increase of nearly 400,000 tons in the gross output of coal is to some extent attributable to the fact that three or four collieries, which by the end of 1908 had only commenced to ship coal, steadily increased their production in 1909, it is also evident from the preliminary returns received that the older and larger collieries also contributed materially to the increase.

The older collieries in the Coast district are those of the Western Fuel Company, at and near Nanaimo, Vancouver Island, and of the Wellington Colliery Company (Dunsmuirs), at Cumberland and Extension, respectively. The production of the Western Fuel Company's No. 1, Protection Island, and Brechin mines, reached to higher figures than in any other recent year. Thanks to the courtesy of the manager of this company, the information is available that of the company's gross production in 1909 of about 512,000 long tons, about 51 per cent. was disposed of in British Columbia, while 49 per cent. was exported to foreign countries in the proportion of 32 per cent. to California and 17 per cent. to other parts. No information was received in time for mention in this review of the year's results at the Dunsmuirs Collieries, but it is believed their produc-

tion was larger than in 1908, when a gross output of about 778,000 tons was made, and of this 71,000 tons was used in making coke. It is probable their 1909 output was nearly 800,000 tons gross.

The establishment by the Pacific Coast Coal Mines, Ltd., of a flourishing coal mining enterprise on Vancouver Island in 1908-9, is one of the evidences of progress on the coast. This company, which has its head office in Victoria, B.C., has coal properties at South Wellington and Suquash, both on Vancouver Island, and at Malcolm Island, off the north-east coast of Vancouver Island. Its more important operations have been at South Wellington, in the Nanaimo district, where the year's development consisted of some three miles of slopes, levels and roadways in the coal. The year's production of coal was about 45,000 tons, of which about 11,506 tons were exported, most of it to Mexico, on the west coast of which country a market for this company's coal is being developed. Latterly production has been increased to about 600 tons a day, and a ready sale is found for all coal produced.

Several other coal properties on Vancouver Island have also been worked, but as yet their production is very small. Coal measures on Graham Island, of the Queen Charlotte group, are being prospected by probable purchasers. Coal has been found in various parts of the northern country through which the Grand Trunk Pacific Railway is being built, west of the Rocky Mountains to Prince Rupert, the limits of one area discovered on the Morice River in 1908 by W. W. Leach, of the Geological Survey of Canada, were largely determined by that official during the field-work season of 1909; another area, near the headwaters of Skeena River, was examined by Chas. Fergie, formerly of Nova Scotia, for prospective buyers resident in Great Britain.

In the Nicola country, the Nicola Valley Coal and Coke Company did much development work in its Nos. 1 and 5 mines, Middlesboro collieries, and also gave attention to Nos. 2, 3, and 4. The coal opened in No. 5 is exceptionally clean and hard, and of excellent quality. The addition to mine equipment included the extension of No. 1 tipple for the handling of all coal from Nos. 1, 4 and 5 mines; erection of a boiler and compressor house, and installation therein of two 72-in. by 18-ft. steam boilers, and a Rand compound condensing steam and compound air compressor having a capacity of 2,215 c. ft. of free air per minute, complete with air receivers and necessary connections. The company's output of coal in 1909 was about 70,000 short tons. Labour difficulties restricted production during three or four months, but as the year closed, production was between 9,000 and 10,000 tons per month, an agreement with the men having been come to, and the demand for coal good. Development work was done at the property of the Diamond Vale Collieries, Ltd., also in Nicola Valley, but the production of coal was small.

The extension of the V. V. and E. Railway to Princeton, Similkameen, enabled the Vermilion Forks Mining and Development Company to commence shipping coal. The company's colliery at Princeton is only developed sufficiently to admit of a present output of about 100 tons per day, but transportation difficulties having been overcome, additional plant will be installed and production facilities be shortly increased.

Coal measures occurring near Midway, in the Boundary district, are being opened and coal taken out in small quantity.

The Crow's Nest Pass Coal Company is the largest coal producer in the Crow's Nest country. It has three collieries—at Carbonada, Coal Creek, and Michel, respectively. Its output is from Coal Creek and Michel, at each of which there are several mines producing freely. Somewhere about 900,000 tons gross of coal were mined, and about 250,000 tons of coke made in 1909. Equipment of these collieries is extensive, designed to meet the requirements of a much larger output than is at present practicable. Additions to power plant in 1909 were the installation of the three Rand-Corliss air compressors, one at Coal Creek and two at Michel. At the former colliery the machine put in is a compound condensing steam 3-stage air compressor, having a capacity of 1,300 cu. ft. of air per minute compressed to 1,200-lb. gauge pressure. A similar machine was installed at Michel, and as well a low-pressure compound condensing steam and compound air compressor having a capacity of 4,523 cu. ft. per minute.

At the colliery of the Hosmer Mines, Ltd., situated between Fernie and Michel, during 1909, there were completed the 3-compartment main and parallel tunnels, these cutting ten seams of coal, of which five, having a total thickness of 48 ft. of coal, are workable. Gross production was between 65,000 and 70,000 tons of coal, more than half of which was made into coke. The power and coal-handling equipment here is for an output of 2,000 tons per day, and the tipple is designed and built for twice that capacity. There are 240 beehive ovens, having a capacity of 400 tons of 48-hour coke per diem.

The Corbin Coal & Coke Company, which, like the Hosmer Company, commenced shipping coal late in 1908, made an output in 1909 of about 65,000 tons. Of this quantity, 80 to 90 per cent. was exported to the United States, chiefly for use in northeastern Washington. Two seams of coal are being developed. On No. 1 seam practically all the development is in coal, there being scarcely any rockwork. The main entry, dimensions 9x16 ft., was driven between 1,800 and 1,900 ft., and the counter air course, 9x12 ft., nearly the same distance. Three main raises were made from the main entry, each 355 ft., to connect with a third tunnel 200 ft. long. The main entry for No. 2 seam was driven between 150 and 200 ft. in coal. Surface improvements made during the year included the erection of coal storage bin with a capacity of 1,500 tons; trestle approach to same 350 ft. long; boiler, power and fan houses; stable and granary, hospital, and 42 dwelling houses.

One of the most valuable coal fields in the province —the northern extension of the Crow's Nest field, in which the last three aforementioned companies are operating—is being prospected with a view to the opening of coal mines in it as soon as railway transportation shall have been provided.

Other Minerals—No commercial production of any of the undermentioned miscellaneous minerals is being made, but their occurrence in British Columbia may be noted here.

Antimony ore is known to occur in the Slocan district, and its discovery in the Lillooet district was reported last summer. For some months of last year antimony was recovered from the electrolytic slimes at the Trail lead refinery, but when the market price of that metal dropped considerably it was no longer profitable to save this mineral. The finding of molybdenum on Quilchena Creek, Nicola District, was announced last September.

The deposits of mica, long known to occur at the head of Yellow Creek, Big Bend of the Columbia District, north of Revelstoke, received renewed attention last summer and autumn. Further work was done

toward developing the mica, and efforts were made to induce the Provincial Government to improve the trail to the property so as to make it accessible at least to pack animals.

A few ounces of platinum were obtained in the Tulaneen River district, but no practical work was done toward producing this metal commercially.

The cinnabar which some years ago was worked in the Savonas district has not been touched lately.

Building Materials.—Marble is being quarried and worked in a commercial way both at Nootka Sound, Vancouver Island, and in the vicinity of Kootenay Lake, West Kootenay. Several large buildings in Nelson have been constructed chiefly of marble from opposite Kaslo, while marble from Marblehead, eight miles from the head of Kootenay Lake, is being freely used for ornamental purposes in buildings and for monuments and tombstones.

Much granite, sandstone, and other building stone, of which there is an abundance and in great variety in different parts of the province, is being used in buildings, especially in the larger cities of the coast. Bricks —common, the silica brick made at Parson's Bridge, near Victoria, and the ornamental building and firebrick from Clayburn, in the Fraser Valley—are finding an increasing market in the province.

Lime from the Tacoma Steel Company's limekilns at the north end of Texada Island, is much used in Vancouver, Tacoma, and Seattle; while that from the Raymond kilns, near Esquimalt, finds its chief market in Victoria.

Portland cement is still being made in considerable quantity at the Vancouver Portland Cement Company's works on Tod Inlet, Vancouver Island, and this local product has practically driven imported cement out of the British Columbia market, its quality being excellent.

THE COST OF COAL IN NOVA SCOTIA.

Abstract of Article by the Hon. Robert Drummond—The Original Article Appeared in the Annual Review Number of the Halifax Morning Chronicle.

During the year coal prices have been maintained, and no reduction in price is possible. With the present price, which some unthinking people consider high, the smaller operators find it takes them all their time to make ends meet. Wages have also been maintained; there has been a small increase of the lower paid men here and there. The United Mine Workers of America promised our miners fabulous wages, if they would swear by the U. M. W. A. After reading the evidence of McLennan at the "conspiracy" trial some may be inclined to think that if a miner of his limited experience can make six dollars a day, the wages of some are already fabulous. After reading his evidence some coal consumers might be justified in thinking that if coal is high in price it is due to the fabulous wages paid, and yet the U. M. W. A. would seek to make the miners believe that much as they are getting, they could get them more. What a funny way they are setting about it. Trying to convict the managers of our mines of conspiracy to keep up prices, knowing they are ignoramuses if they do not—that if coal prices tumble, down tumble wages.

. . . . . .

Here, lest I forget, let me say, and I say it realizing fully what I am about, that the Dominion Coal Company has been the salvation of the coal trade of the province. When the Dominion Coal Company took over the several Cape Breton properties, most of them were on the verge of bankruptcy; they could not have stood it much longer. Coal at that time, it is true, was cheaper than to-day, but the companies were making no profits, and the miners were making no adequate wage. The coal trade of the province was all but at a standstill.

Further, let me say that if the price of coal is not even higher to-day thanks are due to the much maligned company. Were the Dominion Coal Company so minded, it could practically crush out all its contemporaries but one, and should new companies be rash enough to arise it could continue the crushing-out process, and then, competition withdrawn, it could set its own price. This, some may say, is a wild statement; it is made nevertheless in cold blood.

Those who are ignorant of conditions as they exist at the mines, may think coal is high. Those who are familiar with them know the price carries no adequate profit—all the risk and uncertainties attending coal mining considered. Mr. B. F. Pearson in his testimony in the conspiracy case, gave it as his opinion that had coal prices not advanced the smaller coal companies would ere this have been in the hands of receivers. A few years ago Mr. Pearson may have thought the coal barons were making millions. He knows better now.

Let us enquire about the alleged millions the coal barons are making. In his testimony before a Conciliation Board, the manager of the Springhill mines said his company had been losing money for years, and the board believed his testimony. The shareholders of the Eastern Coal Company were promised big money long before this, and as yet they have received not a cent. Had the Strathcona Coal Co. been making barrels of money its colliery would not have been closed down. The Maritime Coal, Railway and Power Company is digging away in the hope of some day getting some return for the money expended.

So much for Cumberland County. Now for Pictou. For the past few years, due to the exercise of the strictest economy, the Intercolonial Coal Co. has been able to declare a five per cent. dividend, but for fifteen years the shareholders went about mourning without it. The Acadia Coal Co. has not paid any dividend of late.

Coming to Inverness, the Inverness Railway and Coal Co. did not for years earn interest on its bonds; it is, however, doing that now, but little more. The Mabou mines were not a financial success. The Port Hood mines were in the hands of a receiver at least once, and later an arrangement had to be entered into. Mr. Black in Fielding's court, the other day, made two statements, the one seeming contradictory of the other. He said that he had been in the Port Hood Coal Co. and was glad to get out of it; and that he had got interest on his bonds. O! the wily fellow, and the unsophisticated lawyers: Why didn't they ask "And how much of the principal?"

Coming to Cape Breton, the General Mining Association, between 1880 and 1900, was able, in some years, to declare a dividend of 5 per cent. The Victoria Mines were a dead weight. Lingan closed down for want of a market for coal, dirt cheap as it was. The Gardner or the Reserve, or the Clyde, or the Collins, or the Toronto shafts never paid or else they would not have shut down.

I state a hard fact when I say that the General Mining Association, the McKeans, the Archibalds, the McLennans, the Kennellys and the Burchills, the barons of 1892, made more, very much more, money by giving up the coal business than ever they made in it. And there is the Gowrie and Blockhouse, Ltd. Ask the English shareholders how much they made of it, and be buried in their scorn. It is not nice to be forced to write in this fashion, but it is about time the truth were made known, no matter the consequences—to put it that way and not in Lord Milner's emphatic way.

Some are ready to declare, when told there is not a bonanza in coal mining, that it is because our mines are inefficiently managed! The answer to that is: There are no better managed mines in the world, and no more efficient and wide awake managers.

Why then is coal dearer than in the United States? Because nature has made it so. Our seams are, many of them, of high angle, they make more water, requiring expensive pumping machinery; our roofs are more tender, necessitating more and heavier timbering; and our mining laws are more exacting. In the conspiracy case, when the lawyers have come to addressing the Court, those for the defence have a glorious opportunity, when the price of coal has to be dealt with. The lawyers for the defence may ask His Honour "Which will you have, cheaper coal and the lives of the workmen held cheaply, or dearer coal and life safeguarded?" Security and safety enter largely into the cost of production of coal in Nova Scotia.

How is coal so cheap in the United States? Here is the reason—"The imperfect methods of conducting a mine, incident to the low price of coal are resulting in the death or injury of between 8,000 and 10,000 persons annually in the United States." The speaker was Dr. Holmes of the United States Geological Survey.

Let the question be put strongly and clearly, "Which is it to be"" They have cheap coal in the United States with unsafe operating conditions. Coal is dearer here and life is securer. Again let me ask, in slightly different form, those who are berating the coal barons and bewailing the price of coal: Which is it to be? United States prices with resultant loss of life and property, or Nova Scotia prices with less loss of life and less loss of property? Is it to be, talking of production, a life lost for every 50,000 tons of coal produced there, or a life lost for every two hundred and fifty thousand tons sold here?

COBALT DURING 1909.

A Review of the Past Year in Canada's Famous Silver Camp.

Written for the Canadian Mining Journal.

Whatever wild oats Cobalt may have sown in her salad days, she has settled down now in the paths of conscious rectitude, the dignified paths of productive matronhood. Beyond an occasional spasm of excitement or a rare day of depression, she no longer responds to the mesmeric charms of her Svengali—the stock-market manipulator. In more senses than one, Cobalt has house-cleaned. She takes herself seriously; she insists upon being taken seriously by outsiders. Her high elation of yesterday has to-day become tempered self-esteem. She is an international figure, and she knows it.

Cobalt takes herself seriously. The town of Cobalt, chastened by fire and by an epidemic of typhoid, has emerged a cleaner and a wiser town. The mines of Cobalt, under management that is improving month by month, are yielding returns that are more than gratifying. In a word, town and district are flourishing. One year of unequalled productiveness will, unless all signs fail, be followed by at least one other that will excel it.

The influences that have moulded Cobalt, that have brought it out of the depths of speculative chaos and have placed it on the pinnacle, are distinctly discernable. I think that first of these is the Mine Managers' Association. This body, a strong union of the leading managers and superintendents, has regulated the labour situation, has assisted in all good public movements, has promoted sound legislation, and, when the civic authorities have been found incompetent or indifferent, has stepped bravely into the breach. To the association is due nearly all the credit of grappling with the typhoid plague. Upon the association, also, fell the duty of rounding up the "high-graders" and their confederates.

Possibly, in a review of this kind, it will be better to discuss in separate paragraphs the various subjects and incidents that must be considered. However, this general laudatory mention of the Mine Managers' Association is fully deserved by that body. Moreover, I shall begin my very incomplete review with a paragraph giving a few details concerning the association.

Mine Manager's Association.

The miners' strike of 1906 might have brought very serious consequences had not a group of managers made up their minds that, since a fight appeared inevitable, they would take a hand in it themselves. The strike proved a total failure. Intemperate agitators found that, for once, they had encountered men more resolute and much more resourceful than themselves. Therefore, after exploding some oratorical fireworks, the strike leaders decamped.

From this small beginning the Mine Managers' Association grew, until now nearly all the producing mines and a number of the most important prospects are represented on its roll.

The functions of the association are manifold. It controls the supply of labour. It maintains a free employment bureau, where those seeking work may register their names, and where the records of undesirables are carefully preserved. It enforces its own schedule of wages. But, over and above these duties, the association, as a body, established, supported, and continues to support, the public hospital. When typhoid fever broke out last summer the hospital was free from debt, and had a cash balance on hand. Now, when the disease has been practically wiped out, the hospital carries a debt of more than $28,000. This debt is secured by notes from members of the association, and is being gradually removed by cash contributions from each mining company, the extent of each contribution being determined by the number of men employed by each company.

The association has been able to secure from the T. and N. O. Commission many improvements in the railroad service. Also from the Provincial Government concessions have been obtained that might not have been readily granted to individuals.

A creditable new building, designed as a home for the Mine Managers' Association and for the Employment Bureau, has just been completed. Also a new hospital is projected.

Canadian Mining Institute Branch.

The Cobalt Branch of the Institute is the strongest offshoot in Canada—at least in point of numbers. I believe that this is not altogether an advantage. The branch has not been as active as might be during the year, possibly because it has become unwieldy. There is any amount of good work that it might tackle in Cobalt. The reading of papers is not everything. If, for instance, the branch could find out what mining men actually want in the way of mining laws, it would certainly win the gratitude of many humble kickers like myself. Still, to do it justice, the branch has established a library and a fine collection of specimens.

Transportation and Other Matters.

The Temiscaming and Northern Ontario Railroad was projected as a colonization road. The men who fathered the idea of a railroad piercing the northern clay belt would have thrown the expected fit had they been told that Cobalt would bring more freight and passenger traffic in a day than they expected from the new line in a month. In fact, the present volume of freight was never figured upon in their rosiest dreams.

Cobalt has made the T. & N. O. It surprised me, and it will surprise the reader, to learn that every month between 600 to 700 freight cars enter the railway yard at Cobalt. The railway's revenue from freight alone in 1908 amounted to $471,203. The passenger revenue ran up to $366,504. Ore royalties brought in $134,820, while receipts from express, telephone, and telegraph services brought the grand total up to $1,127,885. A net surplus of $419,488 was earned.

The T. and N. O. Commission charges a demurrage rate of $3 per day on each overdue car. This is palpably unfair. The Commission has provided no facilities for handling freight. A little lesson in reciprocal demurrage would make the Commission sit up. The passenger service has been improved by the addition of dining cars to the through trains. Further improvements are needed, especially in the matter of hours of departure and arrival.

Cobalt city has a population of about 5,000 souls. In the twelvemonth ending September, 1909, the population showed a growth of 39 per cent. Immediately round and about Cobalt proper there are fully 2,500 people. Three thousand men are employed in the mines. Hence it is not surprising that each day 500 tickets are sold at Cobalt station. Incidentally, the T. & N. O. is putting up a decent station building to replace the indecent shack that had survived its usefulness for some years.

Rents in Cobalt are high. A house that cost not more than $1,000 to build rents for $25 or $35 per month—not an unprofitable form of investment. Some buildings have netted their owners 50 per cent. per annum in rent. Insurance, of course, is very high. I am informed that rates as high as 10 per cent. are charged.

During last summer the Township of Coleman spent $30,000 on roads. Now most of the mines are connected with Cobalt, and, in many cases, with each other, by means of macadamized roads. Next summer a larger sum will be appropriated.

Waterworks and a sewerage system are to be installed in Cobalt at an estimated cost of $75,000.

Labour.

There is no scarcity of labour. The general tone of the workmen has been much improved in the last two years. In efficiency it is generally conceded that Nova Scotian miners are at the top of the list. But a good local breed of miner is being developed. As in every rich camp, the pay-rolls contain names drawn from nearly every nation under the sun.

The miners of Cobalt are exceptionally well treated. The bunkhouses are clean and comfortable. The best of food is provided. Board and lodging, as provided by the mining companies, only costs 60 cents per day. Wages are high. It is a fact that most of the companies lose money in running their bunkhouses. This speaks well for the spirit of the camp.

The Mines.

Twenty-nine producing mines shipped about 30,000 tons during 1909. The silver yield of this ore aggregated 25,000,000 ounces. The record for 1908 was 19,437,875 ounces of silver from 25,624 tons of ore.

In rough figures the total ore produced from Cobalt since the first shipment ever made, is 78,000 tons, yielding in silver about 62,500,000 ounces. In dollars this represents $33,000,000—of which $15,750,000 has been paid in dividends. It may also be noted that 16 dividend-paying mines have paid almost 50 per cent. on their total capitalization.

A general survey of the camp indicates that positive ore reserves are larger now than they were a year ago. More than this, the production during 1910 will be larger than in 1909, and costs will be lower. This last is due largely to cheaper power, but partly also to better administration.

The deepest shaft in Cobalt district is No. 3, Kerr Lake. This working is down more than 400 feet. The next deepest is probably one of the Nipissing shafts, sunk to a depth of 300 feet.

Nothing in development has warranted the belief that values continue beneath certain points. Seventy-five to one hundred feet is probably the average depth of greatest vein richness. About 90 per cent. of the silver already produced has come from the Lower Huronian conglomerates and slates.

The relative shallowness of Cobalt ore bodies must not be misinterpreted. There remains yet much ground to prospect. Many of the mines are in better ore than they were a year ago. The mines immediately round Cobalt Lake have greater ore reserves than in 1908, and the ore is generally just as rich.

The Nipissing Company's property is a good illustration of the character and extent of the work done in the camp. The company's total acreage is 846 acres. In five and one-half months 24 new veins were discovered on this property by trenching—14 in conglomerate and 10 in Keewatin. The most important of these were in the conglomerate. The average depth of trenching is 3½ feet. Much of the territory has been trenched in 100-foot squares; some of it in 50-foot squares. Ultimately all likely territory will be trenched completely in 50-foot squares. This will mean, both for Nipissing and for most of the other companies, the prospecting of new territory and the re-prospecting of old. The mines in conglomerate, near Cobalt town, depend largely upon underground prospecting. One encouraging incident that occurred during the year was the fact that after sinking more than 150 feet on a barren calcite vein, one company encountered silver.

Little has been done during the year to add to power equipment—except as required for concentrating mills. In other words, the Cobalt mines are practically

equipped now, and are only awaiting for air to be delivered from the Cobalt Hydraulic Company to increase their drill capacity.

Concentrators.

There are now nine mills in operation. Their total capacity is approximately 850 tons of ore per day. Four additional mills are under construction or nearing completion. These will bring the total milling capacity of the camp up to about 1,250 tons per day. The stamp mill is now acknowledged to be a necessity.

During the past year about 130,000 tons of mill-rock were sent to the concentrators. This compares favourably with the tonnage for 1908, when 50,000 tons were dealt with.

Rock carrying from 15 to 140 ounces of silver is sent to the mills. This includes screenings. Screenings running about 140 ounces are sent to the smelter. The average mill-rock carries about 30 to 40 ounces.

It is generally conceded that one of the customs mills has achieved the best results and has led in developing the milling practice of the camp. At this mill, it is well worth noting, cyanidation is not used, and indications do not point to its adoption.

One mine has done a great deal towards improving ore-dressing by adopting devices for preliminary sorting. All the ore is sent over dumping-tables, which are fitted with screens, succeeded by picking tables, and supplied with running water. To both screens and tables a bumping motion is imparted by means of air-drill pistons. The fines fall through screens into bins. This material, carrying, say, 50 to 150 ounces of silver, is sampled and analyzed at regular intervals. The assays determine whether it is to be sent to the smelter or to the concentrator. The high-grade lump ore, containing up to 2,000 ounces of silver to the ton, is hand-picked off the bumping-table. The discards are delivered over the end of the table to the dump. All discards are regularly sampled.

By this method the silver tenor of the discards is kept under 15 ounces. Control and records of the value of screenings and discards are made possible. The management is enabled to find out promptly whether the discards are or are not worth concentrating. Handling is simplified and much time is saved. Nine of these devices are in operation. Nipissing, La Rose, and Chambers-Ferland are the mines using them.

Smelters.

The service offered by the smelters is undoubtedly better and more prompt now than it was a year ago. There has been no material change in the schedules of rates, but the market for ores is wider, and competition is keener. A number of the smelting companies have representatives at Cobalt.

It is curious that, although the camp could easily supply all the cobalt needed in the world several times over, yet the total returns from sales of ores of cobalt, since the beginning of the camp hardly exceed $500,000. This is a question that calls for attention. The arsenic problem also is important.

THE YEAR IN ONTARIO.

By Thos. W. Gibson, Deputy Minister of Mines.

Of the great primary industries, the chief in Ontario has always been agriculture. Lumbering has come next, and until lately mining has lagged far behind. But of recent years the situation has taken on a different aspect, and the mineral industry is claiming its legitimate place. To all appearances, the extraction and utilization of the mineral wealth of Ontario will prove one of the most powerful factors in the future development of the Province.

Ontario is lacking in coal, and in this respect differs from her sister Provinces both on the Atlantic and Pacific, but in almost every other mineral of importance, her resources are large. In certain substances, both metallic and non-metallic, her deposits are unique in quantity as well as in quality. For instance, in nickel, in arsenic, in corundum, she stands practically alone, not only among the confederated Provinces, but among the communities of North America. Petroleum and salt are produced in Canada only in Ontario, and the same may be said of feldspar and iron pyrites. She shares with Quebec the possession of the best mica mines on the continent, perhaps in the world. In fact, the list of Ontario's economic minerals is a long and varied one. It may yet be found to include even diamonds.

The Nickel Industry.

The branches of mining which have made the greatest progress in Ontario are those which are concerned with the production of nickel and silver. The Sudbury nickel mines now supply the greater part of the world's requirements of this metal, and are year by year increasing their output. In 1904 the production was 4,743 tons, in 1908, 9,563 tons and in 1909, about 12,000 tons. The yield of copper from the Sudbury ores for the same period has been about 70,000 tons, worth in the refined state certainly not less than 17 or 18 millions of dollars.

The Canadian Copper Company remains the principal producer, and its possession of immense and proven deposits gives this company a very strong position in the nickel mining business. For some time most of the ore passed through the company's furnaces has come from the Creighton and Crean Hill mines. Both mines yield nickel and copper, but while Creighton is rich in nickel and comparatively poor in copper, the case is reversed with Crean Hill, whose ore is rich in copper and low in nickel.

The other producing concern is the Mond Nickel Company whose works are at Victoria Mines. Both plants turn out now Bessemer matte only which carries about 80 per cent. of the two metals combined, and which is exported for treatment and final separation of the nickel and copper by the Canadian Copper Company to New Jersey, and by the Mond Company to Wales.

The Dominion Nickel Copper Company, which entered the field some time ago with the view of opening up some of the large deposits on the northern nickel range, has not as yet done much actual mining. At present the company is building a spur line of railway from the Canadian Northern to the Whistle mine.

The nickeliferous pyrrhotite found in Dundonald

Township, near the Temiskaming and Northern Ontario railway line, was under bond during the year to the Canadian Copper Company, but after exploring the property by a diamond drill, the company allowed the option to drop. Other shows of nickel have been found in the same locality, and there is a possibility that the Sudbury district may not contain the only deposits of this ore.

The nickel contents of the silver-bearing arsenides of the Cobalt camp are not important, and yield no return to the owners of the mines. The total production of nickel from the mines of the Sudbury district from first to last has been about 96,000 tons. At an average price of 40 cents per pound for the refined metal, this quantity of nickel represents a money value of about $77,000,000.

Electric power has replaced steam to a very considerable extent in the operation of the mines and works of the nickel district. The Canadian Copper Company has for some time been generating current at High Falls on the Spanish River and transmitting it to Copper Cliff and Creighton. More recently, the Mond Nickel Company has developed a power for similar purposes at Wabageshik Falls, on the Vermilion.

Silver Mining.

The silver mining industry has been developing in Ontario even more rapidly than that of nickel. Six years ago, practically no silver was produced in the Province, the old activities at Silver Islet, and later at the mines of the mainland west of Port Arthur, having entirely spent themselves. In 1903 came the discovery of the wonderful riches at Cobalt. Slowly at first, and with some misgivings, the mining community were led to take an interest in the Cobalt field. But as the phenomenal nature of the deposits became apparent, hesitation vanished, to be followed by the fierce boom which culminated in 1906, and which has had intermittent periods of recrudescence since that time. But the real Cobalt camp recked little of the vagaries and extravagances of the stock market. It went right ahead producing silver. How rapid was the increase in production may be seen by the following figures:—

	Production.
1904.....	206,875 ounces
1905.....	2,451,356 "
1906.....	5,401,766 "
1907.....	10,023,311 "
1908.....	19,437,875 "
1909 (estimated) .	25,000,000 "

a total output of 62,560,000 ounces. It is doubtful if this record has ever been equalled by a silver camp anywhere.

The Cobalt mines have placed Ontario in the third place among the silver-producing countries of the world. Mexico comes first with about 56 million ounces annually, then the United States with 52 or 53 millions. The production of Ontario in 1909 was considerably more than the production of the two best silver States in the Union, say Colorado and Montana, and little short of the combined output of these two States and Nevada.

The camp has had many abvantages; among them, rich ore, a railway running through the field from the outset, a plentiful supply of labour and supplies at reasonable cost. The narrow veins, however, have necessitated a great deal of dead work and the costs per ton have been anything but low.

Last year the shipments of ore and concentrates amounted to 27,721 tons, as compared with 25,624 tons in 1908. The increase in gross tonnage shipped, therefore, has not been large, but fuller details will no doubt show that the proportion of concentrates was much increased.

The concentration of the "low-grade" ores has become a prominent feature in Cobalt practice. Several of the mines have installed plants for the treatment of their own ores, and there are also two custom concentrators, in addition to the smelting and refining works at Copper Cliff, Deloro and Thorold, all of which have been operated steadily throughout the year.

The newer camps of South Lorrain, Elk Lake, Maple Mountain and Gowganda have not developed with Cobalt speed. Several of the South Lorrain mines have made shipments, and so also have some of the properties in Gowganda. The great expanse of territory over which silver has been found in the valley of the Montreal River is remarkable, and it may reasonably be expected that at least some of the deposits will develop into valuable mines.

Gold.

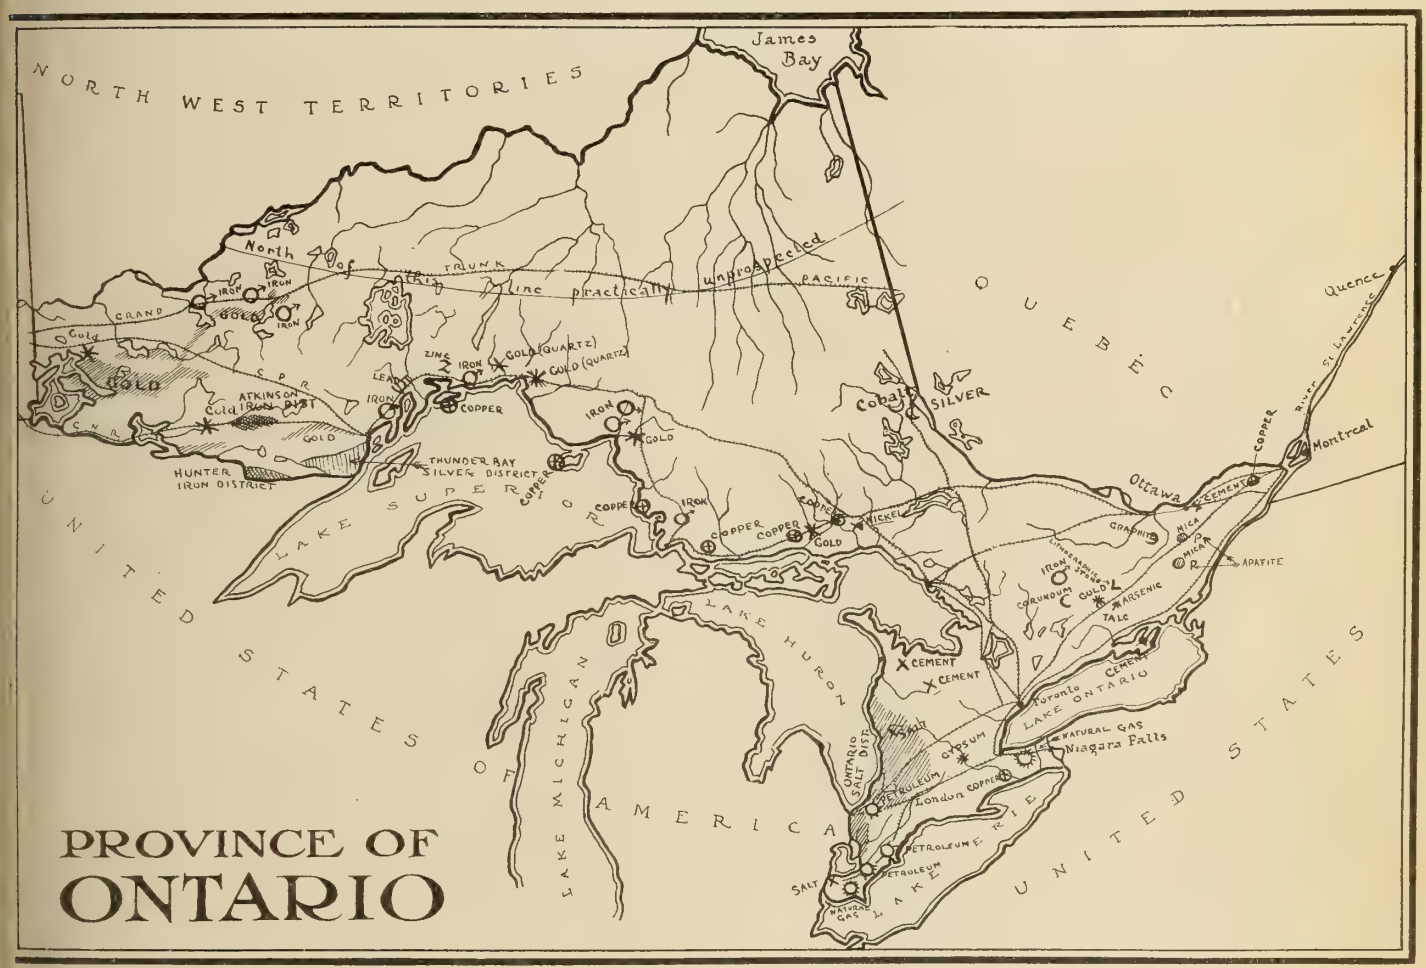
The gold-mining industry in Ontario has had a disappointing history, but in 1909 finds of gold in large quartz veins were reported from Porcupine Lake, in the Townships of Whitney and Tisdale, north of the height of land, and west of the T. & N. O. railway. Some of the veins are of large size, up to 25 feet in width, and contain visible gold in considerable quantity on the surface.

Options have been taken on several of the most promising claims by some Cobalters and also by New York and Scotch capitalists. The diamond drilling and test-fitting now going on will reveal something of the underground quality of the deposits.

Meantime, unaffected by the presence of a foot or two of snow on the ground, the staking of claims is going merrily on, and "discoveries" are being sworn to by the guileless prospector in muskeg and sand plain, quite as readily as on rock exposures. The latter, indeed, form a comparatively small proportion of the surface.

Porcupine holds the centre of the stage at the close of the year, and the indications are that another mining "boom" with its attendant swarm of fake companies will shortly afflict the public and damage legitimate mining.

Iron.



The year just closed was not productive of anything new in the way of iron mining, but previously known mines have been active. The most noteworthy feature was the shipment of a couple of cargoes of hematite from a deposit near Loon Lake, east of Port Arthur. The ore occurs there in horizontal beds near the surface, and is of good quality, so far as regards the absence of impurities, but the metallic contents are not specially high. Drilling has been done on some deposits of magnetite near Moose Mountain, and the reported results are encouraging. Most of the ore actually mined has come, as usual, from the Helen mine, Michipicoten, but Moose Mountain and Bessemer have also contributed to the total.

The pig iron product of the past year will exceed that of 1908, when it was 271,656 tons. The blast furnaces at Sault Ste Marie, Port Arthur, Midland and Hamilton, were operated during the year.

A little zinc ore, amounting to about 785 tons, was raised at the Olden mine, in the county of Frontenac.

Natural Gas.

Of the non-metallic products of Ontario, probably natural gas now holds first place as regards value of output. In 1908 the valuation placed on the yield, at a low price, was about a million dollars, and in 1909, the yield was certainly not less. The greater part is now furnished by the gas field in Haldimand and Norfolk counties, whose production now surpasses that of the Essex and Welland fields combined. During the year several wells were drilled on lands of the Crown underlying the waters of Lake Erie, and good flows obtained.

A satisfactory result of the operation of the tax on natural gas has been the almost entire stoppage of the waste of this ideal fuel, which formerly characterized the operations in parts of the gas territory. The tax is a merely nominal one on gas used in the Province —two-tenths of one cent per thousand cubic feet—but where the gas is exported or allowed to escape into the air, the tax is two cents per thousand feet, which forms a substantial impost. The effect has been twofold—the stoppage of exportation of gas and the cessation of waste. Legislation at Ottawa has also been passed regulating the export of gas and electric power.

Petroleum.

The petroleum fields of the Province of Lambton and Kent counties are falling off in production. For forty years the wells of Petrolea and Oil Springs have been yielding oil, but the average output per well is now not much more than 7 or 8 gallons per day. Even at this rate, 7,000 or 8,000 wells yield a large quantity of oil annually, and fortunately for the permanency of the field, the shallow wells of Lambton county can be operated very cheaply.

In East Tilbury and Romney, where two years ago the output was greater than that of Lambton county, the decline has been at a more rapid rate than in the older fields. The number of wells is much smaller, but the average yield is greater. The production in 1909 was probably less than that of 1908, say a little over 17 million gallons. Notwithstanding the bounty of 1½ cents per gallon paid by the Dominion Government on domestic crude, about one-half the quantity of petroleum required for refining purposes is imported from the United States.

Salt.

The salt wells of south-western Ontario produce from year to year the quantity required to satisfy the home market. The output is restricted only by the demand, for the salt beds along the east shores of Lake Huron, Lake St. Clair, River St. Clair and Detroit River are capable of supplying not only all the common salt needed in Ontario and other parts of Canada for generations to come, but also to furnish the raw material for the production of bleaching powder, soda and other chemicals largely used in manufactures.

Minor Minerals.

In the production of mica, graphite, feldspar and

corundum, smaller but still important industries are enjoyed.

The mining and grinding of talc are being carried on at Madoc, where Mr. George Gillespie is turning out a considerable quantity of the finished article in several grades and qualities.

Building Materials.

Ontario is fortunate in possessing ample supplies of raw material for construction purposes. Clay suitable for making bricks, limestone for burning into lime and for use in building, as well as sandstone of good quality are abundant, especially where there is at present the greatest demand, namely, in the older and more settled portions of the Province. The abundance and general distribution of brick-making clays, for instance, is an important matter in relation to the comfortable housing of the people, for in this climate bricks are preferable to timber for building purposes. The increasing practice of under-drainage, too, is leading to an enlarged production of drain tiles.

The Portland cement manufacture continues to expand with the steady growth of this material in public favour. For many uses, it has displaced wood and stone, and for some it is being substituted for iron or steel. At the inception of the industry in this Province, shell marl was principally used to provide the calcareous elements for cement, but solid limestone, where it can be obtained of suitable quality, is now preferred, as tending to lower cost of production. A number of the cement companies of the Province during the year formed a merger with several companies in the neighbouring Province of Quebec. The manufacture of "natural rock" cement has ceased altogether.

Prospects for the Future.

The outlook for the mining industry in Ontario was never better than at the present time. It would appear that the pre-Cambrian formations, which have proven to be specially prolific in valuable minerals, and which cover the greater part of northern Ontario, are likely to be the scene of great activity for generations to come. As population increases, and especially as transportation facilities are improved, new fields for the prospector and the miner will be opened up, and regions now unknown to fame will take their place among busy communities which, like Cobalt and Sudbury, are bringing to light the stores of mineral wealth now lying dormant in the earth's crust and making them subservient to the uses of man.

THE ASBESTOS INDUSTRY.

Written for Canadian Mining Journal by J. J. Harpell.

In my article on the "Amalgamated Asbestos Corporation, Limited," which appeared in the June 1st issue of the Canadian Mining Journal, I predicted a very rapid increase in the production of South African asbestos. At that time I was speaking from impressions formed by the quantities that were coming into the market and from the information I had regarding its quality and the increasing activity in the mining districts from which it was coming. I am now able to submit figures taken from the Government returns of the exports from British South Africa. These show an increase in production much greater than I had expected. The figures are as follows:—

Year.	Quantity.	Value.	Average price per ton.
1902	45 tons	$3,151	$70.00
1903	305 "	21,218	69.50
1904	411 "	29,186	71.00
1905	672 "	47,696	70.90
1906	680 "	47,901	70.40
1907	580 "	38,517	66.50
1908	1,605 "	108,250	67.40

During the first six months of this year the exports were 1,056 tons as compared with 718 tons during the same period last year. From this it looks as if the production for the whole of 1909 is likely to exceed 2,000 tons. A significant fact shown by these returns is that the Transvaal, South Rhodesia, and Natal contributed to this production for the first time in 1908. I have seen the material from these last three colonies, and it is of a fine white quality, quite similar to our own Canadian article.

From the above figures it will be seen that the average price per ton would indicate that these exports include only the superior grade. This is to be expected since the industry is not sufficiently established to be provided with mills and machinery necessary to produce the lower grades such as paper stock.

There is also fine grade of material coming from Portuguese East Africa. I have not yet been able to ascertain the entire output, but according to the imports into the United Kingdom from this district the increase in production would seem to be equal to that of British South Africa. In fact, the imports in 1908 lacked only 69 cwt. of being equal to those from the latter country, although they began only in 1906. According to the British Government returns, the average price per ton of the Portuguese East Africa material was $173.20 in 1908.

In my previous article I pointed out that the annual production of Russian asbestos had gone up from less than 1,000 tons previous to 1900 to 10,331 tons in 1907. Those interested in the Russian mines claim that the production was much greater in 1907 than they have been credited with. But the figures I quoted were the most reliable that I was able to obtain. I have not yet succeeded in ascertaining the average price per ton for the whole of the Russian output. But the British returns show that the average price of the quantity that came into Great Britain in 1908 was $118.20 per ton.

According to the returns of the Quebec Government the Canadian production of asbestos during the last nine years was as follows:—

Year.	Total production of superior grades.	Total production of paper stock.
1900	21,613 tons	.....
1901	19,382 "	14,054 tons
1902	19,952 "	10,682 "
1903	12,434 "	16,327 "
1904	12,143 "	23,336 "
1905	14,600 "	34,655 "
1906	22,469 "	39,306 "
1907	24,330 "	37,655 "
1908	17,582 "	47,574 "

According to the same returns, the average price of the superior grades in 1908 was $80.55 per ton, and the average price of the paper stock only $23.86.

The heavy cost of transportation has made it impossible for the lower grades of the Russian asbestos to be brought into the market, but this will not be the case with the lower grades of the South African material when mills are erected for its production. Besides, the lower cost of labour in South Africa will mean cheaper production than the Canadian mines can hope to attain under the present high cost of living in Canada. Moreover, it is hard to say what will be the outcome of the present demoralization of the European market for Canadian asbestos.

Furthermore, the report that an export duty is likely to be imposed upon the Canadian material has further aggravated the situation. If this report is not true, it should be denied at once by the proper authorities. On the other hand, if there is any disposition to impose such a duty, a very careful investigation of the whole situation should be made before any such step is taken.

As regards consumption, distribution and manufacture asbestos is quite a different commodity from pulpwood and sawlogs, which commodities, according to rumor, are also likely to be subjected to some special tax. The world's consumption of asbestos at present does not exceed 100,000 tons of all grades.

Undoubtedly the widest application of asbestos is as an ingredient of covering for steam-boilers and pipes. For this purpose it requires no further treatment than it now receives at the Canadian mills. As it comes from the mills it is simply mixed with other materials, which either serve to increase its non-conducting qualities, or to make the composition adhere better to the surface of the boiler or pipe. The percentage of asbestos fibre in such mixture is very much less than is generally supposed. According to Merrill, it is as follows for the respective compositions:—

Asbestos sponge mould.....	4.20%	of asbestos
Fire felt section al covering.....	.8.00%	
Magnesia plastic	7.80%	"
Magnesia sectional covering.....	7.80%	"
Asbestos felting	32.00%	"

To attempt to increase the manufacturing industry of Canada by imposing an export duty on asbestos used for this purpose, would be like endeavouring to compel masons and builders to transfer their business to Canada by imposing an export duty on the Canadian cow-hair they use in their mortar.

The number of merchants who sell asbestos for boiler-covering, and who are in a position to buy directly from the producers and sell directly to the consumers, is legion. They are to be found in every city of any size throughout the world. But their trade in asbestos, as a general thing, forms but a very small part of their business. In many cases it is so small that if it disappeared altogether it would be hardly missed; yet in the aggregate this class forms a considerable factor in the market for asbestos.

The remainder of the market is made up of those who make a business of manufacturing one or more of the thousand and one different articles into which asbestos enters. But here again very few of such firms devote themselves exclusively to the manufacture of asbestos articles. Textile establishments, in addition to carding, spinning and weaving asbestos, manufacture cotton, woollen and metallic fabrics. As a matter of fact both cotton and metallic thread enter largely into the manufacture of asbestos cloth. Manufacturers of asbestos mill-board, paper, or felts also make similar articles from other materials, or use other materials extensively in the manufacture of these asbestos articles. Firms making packing and steam joints also manufacture similar articles from rubber and other commodities. The same is also true of firms that produce asbestos fire-proof paints and flooring, etc. As a matter of fact the manufacturing firms of the world, in whose supplies of raw material asbestos forms the largest item, can be numbered on the fingers of one hand.

This being so, can it be expected that an export duty on raw asbestos is likely to bring many manufacturing establishments to Canada? As a general thing these manufacturing establishments are situated where the advantages of either proximity to the market or of cheap living and cheap labour are of much more economic importance to their promotion than the disadvantages of any export duty that might be imposed on raw asbestos, which, at most, can only be a temporary disadvantage. These manufacturers will soon arrange to get their supplies elsewhere.

The cost of living in Canada has reached a point where almost every article, in the production of which labour enters to any extent, and which has to be sold in the markets of the world and hence compete with similar articles manufactured elsewhere, cannot be produced and sold at a profit. The success, therefore, of manufacturing in Canada depends upon the extent of the market that can be found in Canada itself, where the tariff prevents outside competition and compels the people within the country to pay the higher price for the products of the local manufacturer. But since it will be some time before the Canadian market will be large enough to support an asbestos manufacturing industry, the Canadian producers of asbestos must depend upon their export trade for their market.

But, it will be asked, how are the Canadian producers to retain this market under existing conditions? This is the question that is being asked everywhere regarding the production and marketing of almost every commodity. As yet the problem is far from being satisfactorily solved. But, if we have regard to the attention that is being attracted and the jealousies that are being aroused by German methods, we are safe in surmising that these are meeting with greater success than any others. Certainly the manner in which the Germans meet the exigencies of trade is thoroughly practical and generally successful.

According to the recent and most valuable report on the trade in Germany by Sir F. Oppenheimer, the British consul at Frankfurt, we learn that "Owing to the intensified protective spirit of the last German tariff, German export has been rendered more difficult. In spite of the elaborate protection and preparation of statistics upon which to base a scientific tariff, a number of Chambers of Commerce openly complained that the treaties concluded on the basis of this tariff had dealt German exports a serious blow. The course of the exports of the chemical industry is instructive as illustrating the difficulty of sending goods abroad. Even German commercial enterprise, which is notoriously active and which is certainly the keenest in Europe, has not been able to maintain its grasp of foreign trade. It is to-day freely admitted that the difficulties of German export trade are due to the higher protective barriers which Germany was the first to set up."

"The figures for foreign trade in 1908 are considerably below those of 1907 and on analysis disclose some

peculiar characteristics. There is an extraordinary drop in the export of textiles, and this extends to all the more important items of export. A noteworthy falling off is shown further in the export of dyes and chemical products, amounting to over 35,000,000 marks."

This was the situation that confronted the German exporters at the end of last year and it is interesting to note how they met it. After a very careful review of the whole situation, during which much technical and expert advice was sought, an association was formed in March last, known as "The German Export Union for the Extension of German Export Interests and the Protection of its Members before the Law Courts in Foreign Countries." For the purposes of this organization, it has sent its own technical experts and representatives abroad, and on them will devolve the duties "not only of actually getting business but also of constantly watching over customs formalities and duties and any changes therein; over the conditions of transport and the costs thereof; over local laws in the region of patent protection, as well as the protection of trade mark, etc." For the protection of the legal rights of the members of this Association, its representatives will get into direct communication with local lawyers, and will conclude agreements with them on special terms for the furtherance, or protection of, as the case may be, the member's interests in foreign Courts of Law. Already these representatives are hard at work in all parts of North and South America. The efforts they are making in Canada will give the Canadian people some idea of what the representatives of this Association are expected to do.

This latest move, however, only accentuates the principle that has long been the mainspring of German industrial enterprise and commercial economics, viz., organization. Not organization as we have it in Canada by the formation and over-capitalization of combines and monopolies brought about by brokers, bankers, and company promoters; but organization of associations of producers, for the purpose of determining the best and cheapest means of production and of marketing the products of the different members of the Association. It is to this system more than to any other institution that Germany owes the wide application of science to industry for which that country is so noted. The requirements of these associations for information and for the best trained skill have turned the universities into laboratories of original research, have established the best system of technical education, and have put a premium on the services of the trained student.

What this system of organization has done for the German iron and steel industry will indicate its operation and efficiency. "German progress," says a recent writer, "in steel exportation—progress under natural geographical and economic difficulties quite unknown in England—is a monument to the virtue of organization. The production, price and sale of practically every important material of steel manufacture, from iron ore to machinery, are controlled by syndicates or manufacturers' unions. These syndicates do not, as a rule, control any works as do the American "trusts," but merely the products of the works. The usual German syndicate method is for a number of experts to visit each of the associated works and ascertain its capacity of production and aptitude for any special class of work. Then orders which are usually received by the central offices are allotted to the various establishments, regard being had to the geographical situation and mechanical circumstances of the several firms in order to avoid unnecessary cost of delay in execution. Careful watch is kept by the experts of these associations over new methods and conditions of production, as well as over the requirements and peculiarities of the markets. In fact these syndicates watch over the general interests of their constituents and are in fact manufacturers' trade unions and co-operative societies combined." The efficiency of such a policy can best be judged by results. In 1897 the iron and steel exports of Germany amounted to 1,069,000 tons, and of Great Britain to 3,318,000 tons. By 1908 Germany's export of these commodities had increased to 3,732,000 tons, while England had increased only to 4,233,000. In chemicals German exports have increased by $55,000,000 during the last twelve years, while those of Great Britain have increased by $27,000,000; and those of the United States by about $11,000,000.

Such a policy, whether adapted individually or collectively to the producers of Canadian asbestos, would have been highly beneficial to the industry. In this way they would have been able to keep closely in touch with their market instead of allowing it to drift into the hands of outsiders, who are now in a position to divert this market to other parts of the world for its supplies. With a thorough knowledge of the uses to which their material is put and of the requirements of the market as regards grading, packing, and labelling, etc., they would have been able to sell their material to much greater advantage than has been the case. Such an organization in addition to looking after sales, studying the requirements of the market, and collecting information as regards other sources of supplies, would also have been able to do something towards improving the facilities for shipping and transportation. It seems a piece of gross indifference on the part of someone that there should be no facilities for storing and shipping asbestos at Levis, the nearest and most natural seaport of the Canadian asbestos industry.

Furthermore such a policy of commercial and industrial economy would not be long in discovering that one of the most essential requirements for satisfactory and steady production is faithful and efficient labour, and that such exists in proportion to the labourers' physical welfare and educational opportunities. In Germany, as soon as a new district shows signs of giving birth to an industry, whether mining, manufacturing, or anything else, both the State and those interested in the industry give special attention and encouragement to the development of intensive agriculture. They recognize that this is the first essential of cheap and wholesome living, which, of course, is the basis of cheap and efficient labour. How different are the conditions that still exist in the asbestos districts of Canada, where an important industry has been established for over twenty years. Much of the best agricultural land about the mines is owned by two or three individuals who are holding it for fancy prices. Much of it still remains covered with timber and brushwood. The food stuffs for the miner have to be brought in from a distance and are hence expensive and often of a poor quality. The present Quebec Government cannot be held responsible for the condition of land holdings that exists around Thetford Mines and Black Lake, but they will be responsible for these conditions in new districts such as Chibogamou where they are creating a state of affairs no better than that created by their predecessors in the asbestos districts of the Eastern Townships.

THE NEW PORCUPINE GOLD FIELDS.

Written by Request of the Canadian Mining Journal

By A. M. Hay, Toronto.

The rush into the Porcupine District of Northern Ontario which began a few months ago on the report of valuable discoveries of gold quartz in that section still continues, and the rim of the circle of excitement has already been extended far into the adjoining townships to the north and west, and into the Temagami Forest Reserve to th south.

Th writer accompanied a party of mining men into the section for the purpose of making a cursory examination of the properties upon which work has recently been started under working options obtained from the owners.

Leaving Cobalt on the afternoon of the 4th, of January by Temiskaming and Northern Ontario Railway, the party arrived at Mileage 222 about three o'clock on the morning of the 5th, the train having been delayed through various causes. The camping outfit and supplies taken in by the party were dumped in the snow at this point, no facilities having yet been provided by the Railway Company for the handling either of passengers or freight.

Arrangements had been made for teams to meet the party, and after partaking of a frugal breakfast and sorting out the party's belongings from the chaos of impedimenta belonging to about a hundred passengers heading Porcupinewards, a start was made before daylight, and the party reached the Camp of Father Paradis on the East shore of Frederickhouse River in time for the mid-day meal.

The accommodation at this camp was limited to about thirty or forty, but the meals supplied were excellent. A force of between twenty and thirty men were engaged in putting up new buildings to accommodate about 150 guests.

It being impossible to reach Porcupine until late on the night of the 5th, it was decided to sleep at this camp and leave early the following morning, so as to reach Porcupine early in the day and enable the party to erect camp before nightfall of the following day. Accordingly a start was made on the morning of the 6th at five o'clock, and Porcupine Lake was reached before noon of that day.

While construction of the camp was proceeding a number of the party drove through a distance of about five miles—over a fairly good now winter road—to the properties which are now being tested under option by Messrs. Timmins, of the La Rose Mine, and by Mr. M. J. O'Brien, of the O'Brien Mine, Cobalt.

On the Timmins properties, which are known as the MacMahon and Hollinger claims, camps have been erected and a force of about thirty men is at work opening up the test-pitting veins, which appear to occur in the form of large dykes or intrusions of quartz in a country of diorite and dioritic schist.

Davidson Ledge, Tisdale.

Owing to the snow, it was impossible to determine the extent or continuity of the quartz dykes. They appear however, from examination at different points where they are exposed, to be wide, and of considerable extent. The country rock has apparently been scored off by glacial action leaving the quartz dykes standing up in places in the forms of "hogs backs." At one point where the schist was exposed, it was found to be heavily mineralised with iron pyrites standing vertically at right angles to the quartz, which leads to the supposition that the dyke is striking diagonally across the formation. Except at this point, there were no walls in evidence. Well trodden trails led to various points on the dyke where visible gold had been discovered and exposed, so that there was no difficulty in making an examination of the surface showings of gold, which appear to occur for the most part at points where the quartz has been slightly fissured and considerable ox-

idation has taken place, forming what appear to be pay-streaks, extending in some instances over a surface of several feet in area. No working having been done at these points it was of course impossible to determine whether the visible gold is merely the result of surface enrichment or whether it goes to depth. Numerous samples of rock which had been taken into the camp from points where work had been done gave evidence that the yellow metal had been found at other points

Mileage 222 on T. & N. O. Ry.

on the vein, and the management was enthusiastic and optimistic about the ultimate result of the testing operations which were then being conducted.

On the O'Brien properties known as the Gillies and Miller claims a test pit was being sunk at a point where the dyke appeared to pinch into the country both at depth and in length, and at a depth of about six feet the quartz contained a considerable amount of base mineral. Whether this may be taken as an indication of a change in the character of the quartz which may be met with at depth, or whether it is merely a pinch at

Mileage 222, T. & N. O. Ry.

the end of a large lenticular body of ore can only be determined by further work.

A diamond drill had been set up on this property and drilling operations commenced on the day of our visit, the drill being then about three feet in the rock. The hole has been laid out to test the large dyke on which test-pitting was being done, at a depth of over 100 feet, and the management expected that the test would be made in time to satisfy them whether the free milling character and values of the quartz continued to that depth, before the 15th inst., the date on which a payment has to be made under the terms of the option granted to the purchasers. The result of this operation will be looked forward to with great interest by the whole camp.

Returning to camp at the south end of Porcupine Lake, the night was spent in comparative comfort owing to the strenuous efforts of the party which had been entrusted with the task of clearing the ground, erecting the tent and preparing cooking and sleeping quarters.

On the following morning the bulk of the party

Father Paradis'—19 miles on Trail.

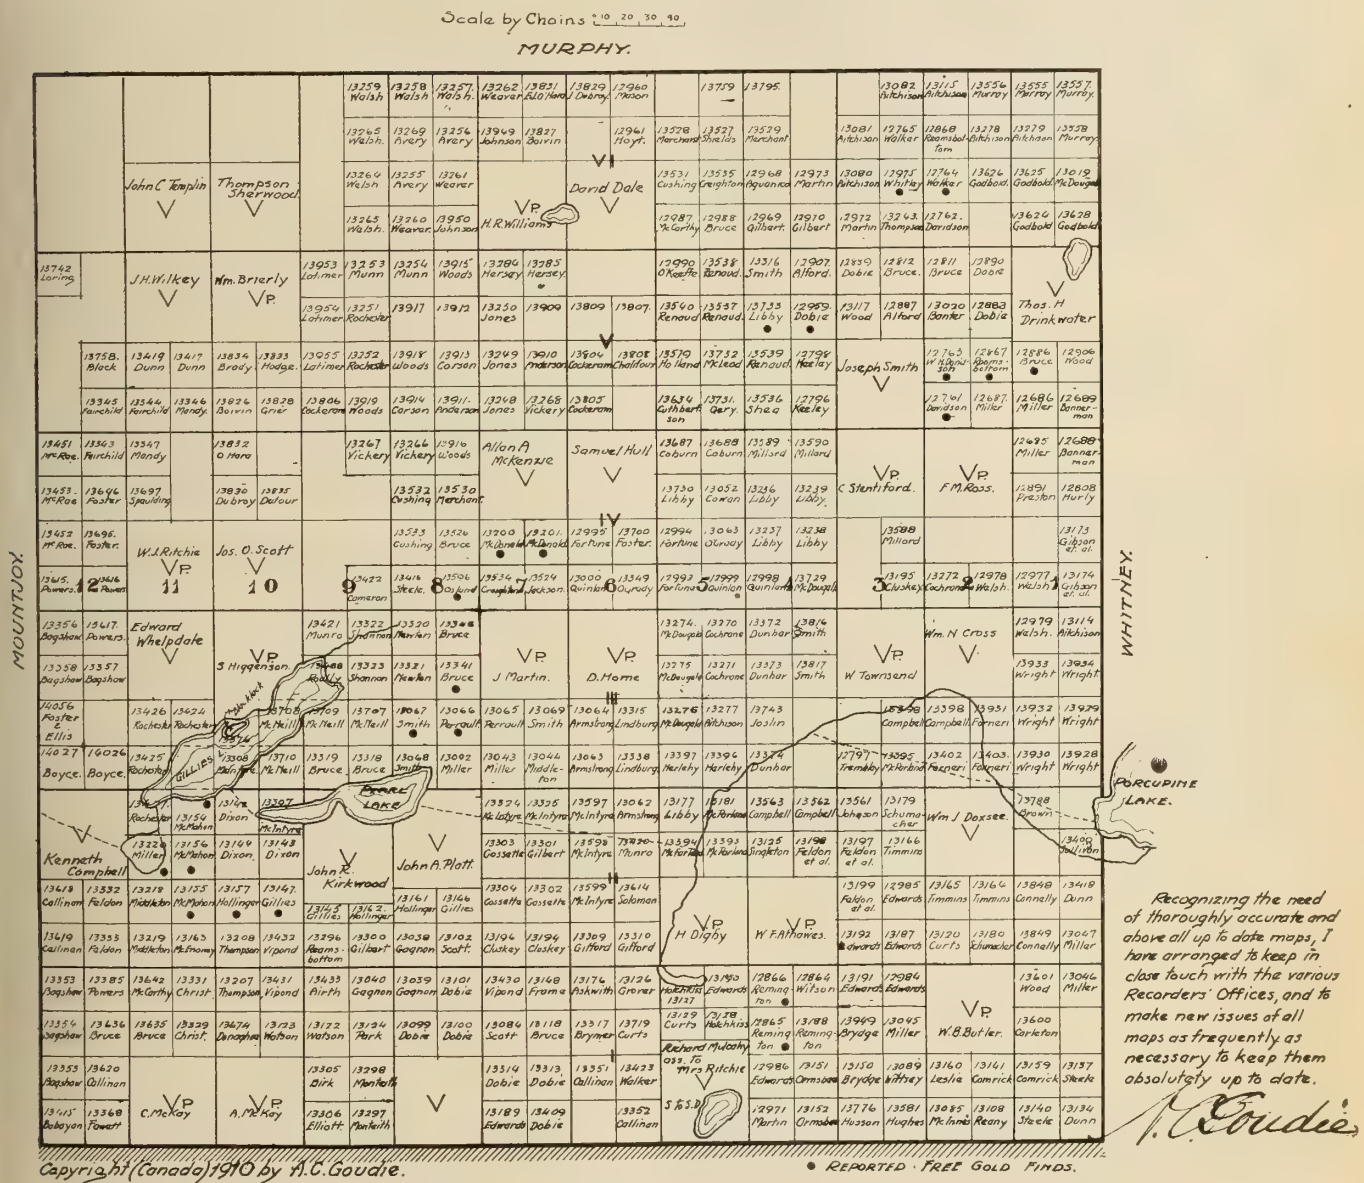
started out on foot to visit the claims known as the "Wilson" claims, which lie about two and a half miles south-west from Porcupine Lake. Under the guidance of Mr. Preston one of the owners of these claims, every facility was granted to the party to make an examination of the properties which, in respect of the formation and the occurrence of visible gold in the quartz dykes, were found to be similar to the claims above described. The showings of visible gold were, however,more frequent and spectacular.

Davidson Shanty.

The claim on which the best showings occur was originally staked on what appeared to be a small auriferous vein, and the huge dyke of quartz was subsequently discovered in getting out timber while camped on their original discovery.

It was the intention of some of the party to visit the Bannerman claims lying near the north end of Porcupine Lake, but it was learned that no work was going on, and with snow on the ground the trip would probably have been fruitless, so this plan was abandoned.

After another night in camp, some of the party drove through to Mileage 222, arriving there on the



night of the 8th, and left that point for the south by train on the morning of the 9th.

It is not to be wondered a t,that the occurrence of these rich surface showings of gold quartz dykes of such magnitude should create a considerable amount of excitement in the communities which take an interest in mining affairs. It must not be forgotten, however, that prospectors have been in the Porcupine District for several years, and many large dykes of quartz have been known to exist in the section but were disregarded on account of the low values which they were found to contain. Mining liscenses on some claims were granted four or five years ago, and the location on which Father Paradis camp is placed was staked by him over three years ago and a mining compny incorported to acquire and develop same.

The history of the Porcupine District cannot be written in advance, but it is safe to prognosticate that the bulk of the claims which have been staked over the swamp and muskeg country surrounding the Porcupine Lake will not show enough rock to admit of being tapped by hammer and steel.

The mining men above mentioned who have acquired options on the claims above referred to, are well able to take care of themselves, and it may be that the high prices asked by the owners of these properties may ultimately be justified.

The danger ahead however, is that many of the Snowshoe claims recently staked, will change hands

and be used as a medium for interesting the public in companies promoted, not for the purpose of developing mines, but for the purpose of reaching money out of the public purse.

That the Government is alive to this danger, and to the injury which will inevitably follow any ill considered boom, is evidenced by the words of warning which have been given out by the Hon Mr. Cochrane, Minister of Mines, through the press.

All roads lead to Rome, and the signboards point to the fact that the mining laws of the country must ul-

timately be laid on lines that will prevent the acquisition of mineral lands from the Crown for anything but legitimate mining purposes. There are many ways in

On the Trail.

which this might be accomplished without hardship to those engaged in the mining industry, but spasmodic legislation enacted during periods of excitement to meet special conditions, is to be avoided. The future deve-

Night Hawk Lake.

lopment of the mineral resources of the Province of Ontario and of Canada as a whole, can only be satisfactorily accomplished under a mining law based on sound and equitable principles, which will not only protect the

Frederick House River.

man who engages in the business of prospectig and mining, but will prevent the legitimate mining business being travestied by speculators for sordid ends.

Such a law must also contain provisions not only to encourage capital to engage in the mining industry, but to protect such investments by enactments which will stand for stability of title and continuity of vested interests.

While the mining law exists in its present form and is subject to modification by Orders in Council, enactments may be made to meet special cases as they arise, but a final and satisfactory solution of the problem can only be reached by the method which has been recommended by unanimous vote of the members of the Canadian Mining Institute, to the Dominion and Provincial Governments, namely to create a Royal Commission made up of representative mining men and Members of the Provincial and Dominon Governments, to co-operate in formulating an Act that will be the standard of the world.

TONNAGES AT TRAIL.

Through the courtesy of Mr. W. H. Aldridge, managing director the Consolidated Mining & Smelting Company, we have been supplied with the following comparative statistics. The figures show the tonnage of ore smelted at Trail since 1899. They give a fair idea of the expansion of both the lead and silver business at that growing centre. It will be noted that in ten years the tonnage has been multiplied almost eight times. The following tabular statement is a synoptical history of one of Canada's greatest industries:—

1899		55,702 Tons
1900—Copper	91,194	
Lead	13,615	
		104,809 "
1901—Copper	122,035	
Lead	21,736	
		143,771 "
1902—Copper	56,793	
Lead	15,539	
		72,332 "
1903—Copper	152,914	
Lead	16,892	
		169,806 "
1904—Copper	139,760	
Lead	18,197	
		157,957 "
1905—Copper	214,969	
Lead	25,347

Note.—Tonnage for December, 1909, is estimated.

BRITISH MINERAL RIGHTS TAXATION—MINERAL RIGHTS DUTY—PROPERTY TO BE ASSESSED.

The rental value of all rights to work minerals and of all mineral wayleaves. But brickclay, sand, chalk, limestone and gravel are exempted.

By the rental value is meant the amount of rent paid by the working lessee under a mining lease, or where minerals are being worked by the proprietor the amount which he would have received as rent if he had let the right to work the minerals.

If the rent has been enlarged by reason of any capital expenditure on the part of the proprietor, the rental value to be assessed is to be reduced proportionately.

The duty is to be paid annually as a debt to the Crown by the proprietor if he is working the minerals, otherwise by the immediate lessor of the working lessee.

Where there are one or more successive sub-leases it is clear that the rental value is being enjoyed by each of the lessors in proportion to the rent which he receives, and that each ought, therefore, to contribute to the duty in proportion. To effect this it is provided that, the whole duty having been paid by the first lessor, each lessor may deduct from the rent paid by him a sum equal to the duty on a rental value of the same amount as the rent which he pays. Agreements affecting this incidence of the duty are to be void.

The duty is to be charged at the rate of five per cent., or 1s for every £1 of rental value.

The value of the right to work minerals is part of the site of land; therefore were owners of minerals to be subjected to the general taxes on site values in respect of the value of their minerals as well as to the special mineral value duty, they would be paying twice over in respect of the same property. To remedy this the bill provides that no reversion duty or increment value duty is to be charged in respect of the determination or grant of a mining lease; and makes the following further provisions:—

No increment value duty is to be charged in respect of minerals which were the subject of a mining lease or were being worked on April 30th, 1909.

Where increment value duty does become chargeable in respect of minerals the increment value is not to be estimated as a capital sum, but is to be taken to be the excess of the rental over the annual equivalent (two twenty-fifths) of the original capital value of the minerals; and the duty is to be charged annually. A payment of increment value duty in this manner is to count as a payment on account of mineral rights duty.

The capital value of minerals referred to above is their total value, deducting capital expenditure necessary to bring them into working; and their total value is the value of the fee simple sold by a willing seller in the open market.

The original capital value is that determined by the general valuation as on April 30th, 1909, in which all minerals leased and being worked are to be separately valued.

The opening up of the Gillies Limit attracted considerable attention to the Keewatin. Up to date the development work on recent discoveries does not show that Keewatin will equal the Lower Huronian. Incidentally, the future of this section has been heavily discounted by several promoters.

PERSONAL AND GENERAL.

Mr. A. G. Kirby, who is superintending the erection of the new stamp-mill and cyanide plant at the Nova Scotia mine, Cobalt, will remain there during the coming winter.

Mr. F. J. Bourne, general manager of the Northern Customs Concentrator, Cobalt, will shortly visit the Portland Canal country, British Columbia. Meanwhile Mr. M. F. Fairlie has been given charge of the plant.

Mr. E. R. Reid, formerly manager of the Union Bank, Parrsboro, N.S., has been appointed sales manager of the Maritime Coal, Railway and Power Company, Limited, and will, in the future, have full charge of this department of the company's business.

Mr. Alexander H. Smith, late of Oaxaca, Mexico, has been engaged by A. E. Osler & Co., of Toronto, as consulting engineer in connection with the development of a large group of claims in the Porcupine district. Thirty men are now starting on assessment work. Mr. Smith will remain in the Porcupine district most of the winter.

SPECIAL CORRESPONDENCE

ONTARIO.

Cobalt.—At the annual meeting of Cobalt Central Mines Co. held a short time ago in Augusta, Me., it was found that the present control of Thos. Nevins & Sons was sustained. Mr. J. S. Bradley, who is the leading factor in the fight against the present management, cast votes for over 1,000,000 shares, but he was not strong enough to take over the control. Tests have lately been made at the concentrator at Cobalt to see if enlarging the mill would be productive of more economical results. So far the experiments carried out have been satisfactory and it is probable that the capacity of the mill will be increased to 120 tons a day.

The Crown Reserve mine has presented all its employees with a bonus of 15 per cent. of their wages for the year as a Christmas present. The unfavourable reports that were circulated regarding this property some time ago appear to have subsided and the recent finding of high-grade ore on the 200 foot level has helped to disprove many of these rumours.

The 200 foot level is in the Keewatin and although the values dropped off to some extent, the veins still continue richer than the average veins of the camp. A short time ago a station was cut on this level preparatory to sinking a winze an additional 100 feet, and the first cut toward widening the drift exposed a branch of the main vein about three inches in width carrying high values in native silver. A raise was also started from the 200-foot level, at a point in the vein where the values were small, but the second round showed about eight inches of high grade ore.

During the year 1909 Nipissing shipped about 6,000 tons of ore, which is almost 75 per cent. increase over any previous year's shipments. A large proportion of this has been of course low grade ore, as this company ships about in the proportion of one car of high grade to four cars of low grade ore. During the month of December the No. 64 vein, near the Hudson Bay Mine produced 100,000 ounces. On the lowest or 275 foot level, which

is in the Keewatin, a drift is being run on the vein toward the east to cut through the contact between the conglomerate and the Keewatin, where it is expected that the high values will come in again. The shaft on the Meyer vein has been sunk to a depth of 190 feet and at that point a station is being cut, from this level a cross-cut will be run to cut the veins that dipped from the shaft at a depth of 75 feet. The shaft that is being sunk on vein 122 discovered last summer, will be continued to a depth of 200 feet and will have three levels. Great hopes are entertained for the future production of this vein as it has been traced for over 800 feet on the surface.

It has always been known that the Cobalt mines suffered to a greater or less extent from high-grading, but the discovery of an organized gang and the extent of their depredations showed that Cobalt had lost more by this means than any other camp in Canada. Under the old law it was exceedingly difficult to obtain a conviction for high-grading as it was necessary for an owner or mine manager to positively identify the stolen ore. Last year the law, however, was changed and now it is necessary to have a written authority from a mine manager or owner in order to keep or dispose of silver ore. Several well-known men in Cobalt and Toronto were arrested, and are now in custody. The ore, when it was stolen from the mines, was turned over to regular fences who took it to Toronto and disposed of it to a small private smelter. The smelter's books show a purchase of four tons of ore for the month previous to the arrests. When it is considered that this ore is the very purest that can be taken and that its value would run about, $4.00 to $5.00 a pound, some idea of the extent of the operations may be gathered, One man admits of having made seventeen trips to Toronto in the past few months carrying each time about 100 pounds of ore.

The Townsite has been getting some good results lately from development, and the physical condition of the mine has much improved from what it was when operations were first resumed on the property. From the No. 1 shaft a cross-cut is being run parallel to the T. & N. O. tracks to pick up some of the Right-of-Way veins. This cross-cut will be continued to cut the McKinley-Darragh vein which was worked by the Right-of-Way. In the No. 7 shaft a good vein about one and a half inches in width of high-grade ore was found. There is also a good width of milling ore, in some places six feet that will carry about 30 ounces. In shafts Nos. 2 and 5 there are also narrow rich veins and large tonnages of milling ore. The company in considering the advisability of putting up a mill next spring.

It is interesting to note that for the year 1909 the Crown Reserve will have distributed $1,238,168 in dividends as against $353,762 for 1908. It is stated that the surplus remaining in the treasury at the end of the year amounted to about half a million dollars.

A new road is being built into the South Lorrain district that will have a beneficial effect in cutting down the cost of transportation of supplies. Formerly the old road went round by way of Lake Temiskaming and was only available during the winter months. The new road will be about ten miles shorter and can be used the year round. It is probable that a telephone line will also be installed between Cobalt, Haileybury and South Lorrain.

During the present year the following companies have paid dividends on their issued capital as follows: Cobalt Central 4 per cent.; Buffalo, 32 per cent.; City of Cobalt, 13 per cent.; Coniagas, 9 per cent.; Crown Reserve, 71 per cent.; Kerr Lake, 13 per cent.; McKinley Darragh, 10 per cent.; Nipissing, 22½ per cent.; Right-of-Way, 37 per cent.; Temiskaming, 12 per cent.; Trethewey 25 per cent.; Temiscaming & Hudson Bay 2400 per cent.; La Rose, 16 per cent.

It is reported that the Big Six property at Miller Lake has encountered high grade ore at a depth of 90 feet. The first property to send out ore from this district for this season is the Blackburn which recently made a shipment of about 36 tons of very rich ore. The Reeves-Dobie has also considerable ore ready to send out, that for richness will compare favourably with the best that has been produced in Cobalt. In the Elk Lake district the Lucky Godfrey has sacked about forty bags of rich ore from the vein found a short time ago.

The Dr. Reddick Co., of Larder Lake, has issued a statement to the shareholders, explaining that the reason for asking for the issue of 118,600 shares was on account of there not being sufficient money in the treasury to carry on their operations. This company is spending a considerable sum of money in systematically developing its property, to find out the extent and values of its ore bodies, and see if they will justify the erection of a plant.

In a drift from No. 1 shaft down by the Drummond, the Hargraves has run into about six inches of high grade ore, in the conglomerate.. The vein in which the silver was found was first discovered last summer on the surface, where the showing was very fine. A shaft was sunk in the diabase and a few feet below the surface the values in the vein practically disappeared. The shaft was continued to a depth of 75 feet and a drift was started toward the east. When in a few feet it passed through the contact between the diabase and conglomerate, and the high grade ore was found in the latter formation. At the 380-foot level of the main shaft the drift on the vein carrying high grade ore has been run to the boundary of the Kerr Lake.

The Buffalo has recently cut two small, but rich veins on the 85-foot level, with about four feet of milling rock. Since the mill has been running with electric power its capacity has been much increased.

The road into the Maple Mountain district has now been cut through from Mountain Chutes to Mackenzie and Stull Lakes and machinery is already being taken in.

Two suits have been brought against G. H. Brown and the Equitable Trust Co. to recover some $21,000, being money invested in the stock of the United Cobalt Exploration Company. The plaintiffs allege that the company was to sell $500,000 of stock to develop properties in this district but that when only $373,000 had been sold the promoters gave up. They claim that they returned $50,000 to persons who bought stock, and squandered the rest of it in payments to persons who were not entitled to it.

Although the shipments for the year 1909 only exceed the shipments for the previous year by about 4,500 tons it is expected that this year's silver production will exceed last year's by at least 4,000,000 ounces. Up-to-date the shipments are as follows:

Prior to 1908	23,182.49 tons
Year 1908	25,362.10 "
Year 1909	29,865.66 "

This large increase in the number of ounces produced is attributable to a great extent to the concentrators that are treating the rock, a large part of which was formerly going on the dumps. Almost $1,250,000 has been invested in concentrators in this section and it is probable that during the coming year this sum will be considerably augmented. It is exceedingly interesting to note that during the past year the amounts paid out in dividends represent about 50 per cent. of the value of the production of the camp, and when it is considered that the City of Cobalt , Right-of-Way, and O'Brien pay 25 per cent. the Hudson Bay 15 per cent and the Crown Reserve 10 per cent. of the gross value of their ore to the Ontario Government in royalties, these figures are even greater than they appear.

BRITISH COLUMBIA.

Rossland.—During the past ten days or two weeks the Consolidated M. & S. Co. of Canada has given ample proof of its expansive policy in the acquiring of several very valuable mines. These are the Ikeda copper group on Moresby Island, the No. 7 in Central Camp, Boundary, and the Sullivan group in East Kootenay. With the advances made by the Consolidated in the

acquirement of new mines the closing down of one of the older properties would not affect the status of the concern in the least, whereas, if operations were confined to the properties being worked at present, news of the closing down for an indefinite period of one of those mines would be received with dismay by the stockholders. It is all a matter of being progressive.

The Ikeda group of about 26 claims, is probably the most valuable copper-gold property in the New Queen Charlotte fields. The mine has been worked for several years by its Japanese owners and is well equipped to handle a tonnage of about 1,000 tons per month. Average "first-class" ore as shipped averages approximately 14% copper, $6 gold and $2.50 silver; "second-class" ore, as shipped to smelter, which is about two-thirds of the total output, 6% copper, $4 gold and $2 silver. The Consolidated Co. will very likely improve the mining plant and if future development warrants, will erect a smelter near the property. This smelter, if built, would no doubt be a paying proposition from the point of view of customs ores and would be of great benefit to the surrounding mines of the Queen Charlotte Islands, and the nearby mainland mines. A sufficiency of coal for such a plant is to be found on the same island, and the ore is practically self-fluxing.

The No. 7 group consists of eight claims and fractions, situated in Central Camp. In the past the cost of hauling this ore to the railway has been about $3.50 per ton, but the Consolidated Co. is going to build a concentrator at Boundary Falls and send the ore from mine to concentrator by a tramway a couple of miles long. The concentrator site has already been secured. The ore is a quartz, carrying gold, silver and lead and is quite amenable to concentration. By means of the tramway the cost of conveying the ore from mine to mill will be reduced to about 15c. per ton. It is reported that there is an ore body "in sight" in the No. 7 of about 200,000 tons.

The Sullivan group has been acquired by lease and bond and initial work begun by a force sent over from the "hill workings" of the St. Eugene which have been closed down. It is understood that there are 150,000 tons of ore in this mine that will average 15% lead and 6½ oz. silver. The Sullivan Co. just before closing down in 1908 had some trouble at the smelter with the zinc content of this ore.

The Rossland mines of the Consolidated Co. are looking very well and steady tonnage is being shipped to Trail smelter, averaging about 400 tons per week. The Le Roi, Le Roi No. 2, Ltd., and Velvet are also shipping steadily each week.

It is seen as the year draws to a close that the Centre Star and Le Roi 2, Ltd., will show a slight increase in ore shipments, but the drop in Le Roi shipments of about 66,000 tons, is going to cause a decrease in district shipments, compared with last year of about 60,000 tons.

Phoenix.—This district has been favoured with the payment of dividends by two important companies during the past ten days, both the Granby Company and the Hedley Gold Mining Co. (Nickle Plate mine) making a division of profits with the shareholders. The Granby dividend was 2%, which on the 135,000 shares, of $100, each, outstanding amount to $270,000. This dividend, which was fully anticipated by those who knew the good financial condition of the company, makes a total of $3,778,630 paid by this company in dividends since December, 1903. The dividends in 1907 were a total of 9%; 1908 total 4%; 1909 altogether 2%. The decrease has been caused by the big improvements, which this year alone, to smelter and converter, will cost over $250,000. Good dividends will no doubt be paid in 1910. Granby mines are shipping nearly 30,000 tons per week to the Grand Forks smelter, where the eight augmented furnaces are working. Total Granby shipments for the year are now over the million-ton mark and for the year will show an increase of about 29,000 tons, over 1908.

The Hedley Gold Mining Co., which acquired the Nickle plate mine at Hedley from the Daly estate last August, at a figure of about $715,000, has declared a dividend of 30c. per share, amounting in all to about $36,000. The air compressor, mill, tramway, etc. are being enlarged and operations will be doubled during 1910. It is thought a saving of about $1 can also be made in the treatment of tailings.

After rumour upon rumour during the last few months, work has now been started on the Rawhide group of the New Dominion Copper Co., diamond drilling being the order of the day, although it is expected shipments will be started at no late date. A crew of 15 to 20 men is employed; power is being derived from the company's Brooklyn air compressor plant.

Between the Mother Lode and Oro Denoro mines the B. C. Copper Co. is shipping over 12,000 tons of ore per week to its Greenwood smelter. Despite the several months shut-down the increase in Mother Lode shipments over 1908 will be over 38,000 tons; Oro Denoro shipments however, will drop about 49,000 tons. It is stated the profits of this company for November amounted to $54,000 and that the cost of copper production for that month was cut to .0735c. per lb., naturally, it is to be expected that the yearly average will run much higher.

The Snowshoe, being operated under superintendent Chas. Biesel, is sending about 4,000 tons per week steadily to Trail smelter. The output of this mine for 1909 will exceed that of 1908 by about 114,000 tons, which will be just about the amount of increase for the year in the Boundary district. While the Granby and Mother Lode show a big increase, the drop in Oro Denoro and the mines of the Dominion Copper Co. hold the district increase to the amount of increase shown by the Snowshoe, which is under lease to the Consolidated.

Nelson.—The convention held in this city on December 15th, to discuss the zinc problem, was a most enthusiastic one, and it is hoped that the influence of this movement will culminate in the establishment of a commercial zinc smelter in this district. It does not seem probable that the Dominion Government can fail to be impressed with the importance of this question to this district, to the Province and to the Dominion generally. An invocation has been addressed to the government asking for aid in experimental work. A protective tariff on manufactured zinc products entering Canada might also help and tend to greater consumption of the product of this district in Canada. At the present time about 1000 tons of zinc ore is being sent per month from this district to United States zinc smelters, and being about 50 per cent. zinc is paying nearly $10. duty and approximately $10. freight—quite a burden. It is to be trusted that this question will be satisfactorily and economically solved before another season has gone past.

Ore shipments for Nelson-Slocan section will show an increase of about 46,000 tons this year over 1908. The net increase for the whole of Southeastern British Columbia will be about 100,000 tons more than for the year 1908.

A new plan of development is to be worked presently in the Payne mine. A rich ore shoot has been located on the eighth level that is thought to be a continuation of the old, rich ore deposit.

Vancouver.—It is stated by E. C. Wallander, manager, that the Kamloops Mines,, Ltd. will open up its property on a large scale in six weeks or two months and that the company has in view the establishment of a smelter at Kamloops, if developments warrant it, of course.

A wagon road is being built into the property of the Red Cliff Mining Co., over which to take the boiler, air compressor and general mining plant recently bought from the Canadian Rand Co. All of the Portland Canal mines look promising and it is expected there will be considerable activity in the district next spring, in the way of plants going in, etc. Active work is being done on the Portland Wonder and Tyee.

Torontonians have bonded three copper-gold claims on Banks Island at a figure of $25,000. There is a ten-foot vein on the property carrying an average of $43. in gold, silver and copper.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—A decrease of nearly 1,000,000 tons in the production of coal and a loss to the Province in revenue of over $100,000 since the inauguration of the strike in the Nova Scotia collieries was the statement by Hiram Donkin, Deputy Commissioner of Works and Mines, on the witness stand in the alleged coal conspiracy case.

Since the strike there has been a falling off in the production of 910,000 tons up to December 1st.

The Dominion Coal Company's production was 700,000 tons less, and the Cumberland Collieries 210,000 less.

Last year more American coal was sold in Canada than ever before. This was on account of the surplus stock on hand.

The sales of American coal are increasing rapidly in Canada. 130,177 tons were sold in November, 1909.

From 1886 to 1906, he estimated that the aggregate advance received by the men was about thirty per cent.

The production of gold in Nova Scotia for the year just ended was in round figures 12,500 ounces, which shows a slight increase over the production of the year 1908.

The principal producers were the New England Mining Company (formerly the Boston Richardson Mining Co.) at Goldboro, The Oldham Sterling Gold Company at Oldham, The Great Bras D'Or Gold Mining Company at Middle River, Cape Breton, The Ponhook Mining Company at Malaga, and the Sydney Gold Mining Company at Country Harbor, altogether about twenty-five mines were in operation employing a total of 550 men.

During the year the Dominion Mining Company at Tangier has changed its plant from steam to hydro-electric, generating power at the Tangier River, about one mile from the mine. This new plant was completed in October and has since been in operation, giving satisfaction.

At Middle River, Cape Breton, the Great Bras D'Or Gold Mining Company has commenced sinking a shaft on the Lizard lead and in the spring purpose to greatly increase their equipment.

At Caribou a disastrous fire destroyed the mill power buildings and shaft house at the Hake property, greatly handicapping the operators. New buildings, however, have been completed, and work underground is to be pushed during the coming year.

At Malaga Barrens the Ponhook Mining Company has reopened the old workings on the Main Rabbit lead, and has installed new and up-to-date equipment.

Although the production shows no great increase there has been much greater activity throughout the province during the past year in connection with the gold mining industry, and indications point to still greater activity during the coming year.

ONTARIO.

Toronto.—Ten of the accused in the Cobalt ore stealing cases were, on January 6th, committed for trial before a jury. They are Alex. Littlejohn, Geo. Barber, J. H. McGale, H. A. Van Winkle, Wm. Lander, Wm. Johnson, Nicholas Zorfaty, Jacob Cohen and Morris Rowchinsky.

Zorfaty was in addition fined $25 for carrying a revolver. Dimitras Andras was discharged and Jaako Hukkala was remanded to obtain an interpreter.

The charge of receiving stolen property laid against Dr. Wilkinson, head of the smelter company, will not be taken up until the theft charges are disposed of.

Ottawa.—A nice little New Year's greeting in the form of $33,000 reached the holders of Right of Way Mines, Limited, Cobalt stock on Jan. 1st. Though the dividend is 2 per cent., it is equivalent to 6 per cent. on the old basis (that of the Right of Way Mining Company).

Cobalt.—Edward Burley, an Englishman, employed at the Rochester, died on December 29th from injuries received at the mine. Burley and his brother were working at the 75-foot level. Preparation had been made for blasting. Burley had lighted the fuse and was walking away to a place of safety when an explosion, possibly caused by a defective fuse, took place. Burley's body was badly broken up by the flying rock. He was thrown on his face and his left shouder was badly crushed. Dr. Melbourne, who was at Kerr Lake, was called in, and removed the victim to the Red Cross Hospital, where he succumbed to his injuries just after noon.

BRITISH COLUMBIA.

Fernie.—General Manager Ashworth of the Crow's Nest Pass Coal Company, reports that over 2,000 tons of coal are being turned out daily at the Coal Creek mines, and as much at Michel, thus making an average of over 4,000 tons a day from all the mines. About 800 tons of this coal is being turned into coke at the Fernie ovens and nearly as much at Michel. The Morrissey mines are not being worked now and it will be some time before they will again be operated, as new development work, both at Coal Creek and Michel, is occupying the attention of the management at present.

Cranbrook.—The Fort Steele Mining & Smelting Company, who recently secured the property of the Sullivan Group Mining Company, which is located at Kimberley and Marysville, has leased the property to the Consolidated Mining and Smelting Company.

The property is leased to the Consolidated Company for a period of two years, with an option to purchase.

The lessees are to begin work immediately. Thirty per cent. of the net proceeds of the ore taken from the mine is to be spent in development work. The lessees are bound by their agreement to mine and take out 30,000 tons of ore during the life of their lease, and to pay to the Fort Steele Mining and Smelting Co. 20 per cent of the net profits derived from the sale of said ore.

If the Consolidated Company succeeds in taking out 30,000 tons of ore inside of six months, they, under their agreement, are compelled to purchase the property.

The property consists of three mining claims, the Hamlet, Shylock and Hope, and is located about two miles north of Kimberley. At Marysville, the property leased consists of an up-to-date smelter, having a capacity of about 200 tons, which can be increased to 500.

The mine is equipped with a first-class compressor, hoisting and pumping plant.

The showing of ore in the mine is enormous. According to examinations made, there is over 200,000 tons of ore in sight ready for stoping. With this large amount of ore in sight, the lessees will have no trouble in mining 30,000 tons of ore inside of the stipulated six months.

The trouble with the Sullivan ore has been the difficulty and expense of getting the proper flux to mix with the ore from the mine, but with ore from the North Star, or the St. Eugene, it is said that the combination will make a self-fluxing proposition.

The resumption of work on the Sullivan will bring renewed prosperity to Kimberley, and with the starting up the smelter at Marysville the residents of these two mining camps will receive a New Year's gift that will bring prosperity to all.

MINING NEWS OF THE WORLD.

EUROPE.

Roumania.—During October the Roumanian oil production amounted to 108,000 tons. For September the output was 111,500 tons.

INDIA.

Calcutta.—During 1908 the tin mines of South Burma yielded an output of 1,887 cwt., valued at £11,015. This production is above the average of that of the past five years.

An important survey is contemplated by the Geological Survey of India Department in the coalfields and oil-bearing areas of north-east Assam.

AUSTRALIA.

Sydney.—The railway and tramway services have been restored. North Sydney was in darkness on the night of Dec. 20th. A supply of coal from the Western district is expected soon. The Western miners resumed work on December 21st.

Of the fifteen lodge officials and delegates prosecuted for offences against the Industrial Disputes Act, in connection with the coal strike, thirteen have been fined £100 each, with two months' hard labour in default.

SOUTH AFRICA.

Johannesburg.—From present indications, and judging by the most recent data, there is reason to believe that in the coming year the mines of the Rand will be operating profitably on 2½ dwt. rock and further reducing expenses by half-a-crown per ton.

As conflicting reports are reaching the Rand as to the results being obtained on the Abercorn Banket Company's property, it has been decided to have an independent examination.

The dividend-aggregate for 1909 from Rand mines promises to equal, and will, in the final results, probably surpass that of 1908, notwithstanding total profits are below last year's level.

Reports are to hand of diamond discoveries in the Carnarvon district of Cape Colony.

Rhodesia.—In view of the great development of Rhodesia's mining industry and the multifarious duties now devolving upon Mr. Ackermann, the Chartered Company's engineer, who has hitherto been at liberty to engage in private work and to report for outside parties, it is now considered in Rand-Rhodesian circles that, in the interests of all concerned, the time is arrived when Mr. Ackermann's services should be solely at the command of the company.

Latest private telegrams from Rhodesia state that the Giant mine values in the seventh level are proving as good as in the upper levels. It is added that Rhodesian mines generally are opening up well and that a big move is inevitable at no distant date.

TRINIDAD.

The annual report on the trade of Trinidad states that a considerable amount of development work was done during the year 1908 in boring for oil at La Brea and Guano, and at both places gushes of oil to a height exceeding 60 feet occurred as the result of the operations. A total of 3,758 feet of borings was made during the year with satisfactory results.

UNITED STATES.

The world's production of gold and silver for the calendar year 1908 is estimated by the Bureau of the Mint to have been: Gold, 21,378,480 fine ounces, of the value of $441,932,200, and silver, 203,186,370 fine ounces, of the commercial value of $108,684,000.

Compared with 1907, there was an increase in the gold product of $31,376,900, and in silver an increase of 18,992,300 fine ounces. The greatest increase in the product of gold in any country of the world was in Africa, which increased from $151,899,600 in 1907 to $166,520,500 in 1908.

Butte.—President J. D. Ryan has ordered the closing of Amalgamated Copper Mines. He has issued a statement in which he states that this is due to action of the miners' union refusing to take any stand or action to aid in the resumption of switching and handling of ore at Great Falls. It has been decided that Anaconda, Butte and Boston, Boston and Montana, Washoe Copper, Parrot, Trenton Co., Red Metal Co., and North Butte could not continue operations under present conditions and must be closed pending such action as would relieve the situation.

The Buell property, near Central City, Colo., which is said to have produced about $2,000,000, principally in gold, has been absorbed and will be operated soon by the U.P.R. Milling and Mines Company, arrangements for financing the property being well under way. The mill of the company is to be electrified and labour-saving devices installed for closer amalgamation and concentration of ore from the property as well as for custom ore.

New York City.—The deadlock at the annual meeting of the Cobalt Mines Company held in Augusta, Me., has been broken, and the old directors are in control, all being re-elected. President Nevins represented 2,250,000 shares, while James P. Bradley, the leader of the opposition, had 1,075,000 shares. The result is regarded here as a vindication of Mr. Nevins, on account of the failure of Mr. Bradley's vigorous campaign to rally greater strength. The directors' meeting will be held in New York soon, when it is expected that all the old officers will be re-elected.

With the payment of the dividend of $8 a share, Calumet & Hecla will have returned to its shareholders for the calendar year 1909 the sum of $27 a share, against earnings estimated at $35 a share. The company's mineral output for the year will be equal to 80,000,000 pounds of refined copper, but as the company is curtailing its ingot output by 14 per cent. only 86 per cent. of this mineral is being smelted. The refined copper output therefore, should be about 69,000,000 pounds.

Globe, Ariz.—The foundation work for the concentrating plant at the Miami property is going rapidly forward, with the exception of a part of that for the power house site where the bedrock upon which the concrete work is to rest is at a greater distance from the surface of the ground than it is at other parts of the site. When the third churn drill has arrived, it may be put to work on this site to ascertain the depth and character of the bedrock at this point.

The two Star churn drills which have already arrived at the property are in position for drilling the first holes, and the management is anxiously awaiting the arrival of some of the tools which were delayed in shipping, so that the prospecting work can be begun. The first two drill holes will be put down in a north and south line and only a few hundred feet from the line of drill holes which the Inspiration Company's drills put down on its property, which adjoins that of the Miami Copper Company on the northern end.

The new office building of the Miami Copper Company is rapidly nearing completion. All the framework is about finished. A new warehouse near the concentrator site is being built.

Company Notes

The International Nickel Co., has declared 1 per cent. and an extra dividend of ½ per cent. on its common stock.

AN ASBESTOS BUREAU.

The operating asbestos mining companies in the Black Lake and Thetford districts and the various manufacturers of the finished products of asbestos, have decided to establish an Asbestos Bureau. A meeting of the representatives of all the companies interested was recently held in New York, when the preliminary arrangements were made and special committees appointed to look after all the details. One of the main objects of the Bureau will be to keep the public advised as to the new uses to which asbestos may be put and of the development of the various properties situated the world over.

Mr. E. B. Greenshields, the President of the Amalgamated Asbestos Corporation, attended the meeting on behalf of the company.

At the annual meeting of the Nova Scotia Silver Cobalt Mining Company the financial statement was approved. It showed $121,000 as having been expended on underground development and over $50,000 on surface work.

The engineer's report showed that the company had over 1,600,000 ozs. of silver blocked out, which would give a net return the first year of some $60,000, and after the completion of their cyanide and amalgamating mill now under construction, and which will be ready early in the spring, the company will be in better condition than at present.

A by-law authorizing application for supplementary letters patent, increasing the capital stock of the company by $500,000, was ratified by the shareholders.

This stock is to be offered to the shareholders at 50c per share, pro rata to their holdings, being at the rate of one to four held, and arrangements have been made with a syndicate to underwrite any of the new issue at this price, which may not be taken up by the shareholders.

The old directors were re-elected with the exception of Mr. A. M. Reaper, who resigned in favour of Mr. A. L. Bayley, of Sherbrooke.

The Buffalo Mines have declared a 5 per cent. quarterly dividend, with 3 per cent. extra bonus, which is equivalent to 32 per cent. for the year.

The Nipissing dividend of 7½ per cent, and the La Rose of 2 per cent, will be payable on the 20th. The transfer books of the respective companies will re-open on January 17th.

The Temiskaming & Hudson's Bay Co. has paid dividends of no less than 15,100 per cent. on its issued capital of $7,761 of $1 shares.

The Granby management has decided to issue 13,500 shares of its 15,000 shares of treasury stock. This will be issued to stockholders of record on the basis of one share of new stock for every 10 shares now held at $85 a share. Granby's authorized capital is $15,000,000. The stockholders several years ago voted to issue stock to pay for the company's investment in the shares of the Crow's Nest Pass Coal Company, and it is presumed that the proceeds from the stocks now to issue will be used in paying the indebtedness incurred in the acquisition of these shares. It is understood that the Granby Co. entered the year 1910 with several hundred thousands of cash in its treasury. At the present time the company is operating at the rate of about 30,000,000 pounds per annum. The maximum capacity is 35,000,000 pounds, and the management has no plans for the enlargement of smelting capacity beyond this figure.

The Crow's Nest Pass Co. has recently increased its dividend to 6 per cent.

A review of the operations of the Nova Scotia Steel and Coal Company, Limited, during 1909 shows large increases in practically all branches as compared with the previous year:—

	Tons.
Coal mined and shipped	830,000
Iron ore mined and shipped	460,000
Coke made	85,000
Limetone and dolomite mined	70,000
Pig iron made	62,000
Steel ingots made	63,000
Billoms and billets cogged	54,000
Finished materials, bars, plates and forgings shipped from New Glasgow	53,000
Amount of freight paid to the Intercolonial Railway	255,000
Freight carried by Sydney Mines Rail way of the company exceeded	1,400,000
Coal and ore freighted by boats owned or time chartered by the company	925,000

The total wages paid by the company during the year was nearly $2,500,000:—

Wages paid at Sydney Mines	$1,698,000
Wages paid at New Glasgow	425,000
Wages paid at Wabana	350,000

With the exception of coke made, the figures named above all show increases over the past year.

The improvements in plant and equipment made in the closing months of 1908 resulted in savings in the cost of manufacture, so that the cost of converting iron ore into the 50,000 odd tons of finished material shipped from the New Glasgow works was less than ever before in the history of the company. Practically all of these savings should be credited to improved physical condition of the plant, as no reduction in wages was made during the period under review.

At Wabana, the slopes, which in the latter part of 1908, after passing through the boundary of intervening ground between the land areas and the submarine areas of the company, had reached the submarine territory of the Scotia Company, have been extended during the past year more than a quarter of a mile. Bore holes put down in the submarine territory of the company have proven the quantity of underlying ore to be greater in thickness than shown on the land or in the inner portions of the submarine extensions of the seams, while the quality has been fully maintained. All the work done during the past year has served to confirm and increase the evidence of the extent and value of these submarine deposits.

At the New Glasgow mills, enlargements and extensions of the furnace heating plant, accessories, and all other devices required for handling the increased output are now being installed. These mills are expected to be in operation during the coming summer. The additional rolling mill capacity now being provided should increase the output of the finished material from the New Glasgow mills by about 20,000 tons per annum.

For 1910, the coal output of the company from its "Old Sydney" mines, will, it is expected, show considerable increases, and will total 900,000 tons.

The unfilled orders for steel products on the books of the company at the beginning of 1910 will aggregate a larger tonnage than at any period during the past two years. Indications point to an increased demand for all classes of the finished iron and steel products of the company.

PORTLAND CANAL ANNUAL MEETING.

At the annual meeting of the shareholders of the Portland Canal Mining Company, Limited, held at Duncans, B.C., on the 11th December, the following reports were presented by Mr. C. H. Dickie, President and Managing Director:—

"Your directors report that during the current year they entered into negotiations with a firm of underwriters, and the

sum of $100,000 was secured to the company in return for a block of the company's shares.

The above capital was required for, and is being used in the installation of a concentrator, aerial tramway, water power plant and for general purposes of the company.

The concentrator and power plant are well under way and will be completed at an early date if the snowfall is not excessive. Had normal conditions prevailed during the past season, the plant would probably now have been complete, with the exception of a part of the concentrating machinery, which has not yet arrived from the manufacturers.

The concentrator has been termed a 50 ton unit, but as our ore will only require coarse concentration, we expect to be able to mill about 100 tons every 24 hours. The tramway, which is of the Bleichert type, is now about completed, and will be 8,000 feet in length and bring ore from the mine at an altitude of 2,100 feet to the concentrator in Bear River Valley. It can be equipped to transport 200 tons every 24 hours and will be utilized for conveying all supplies from the mill to the mine.

Our water power is a splendid asset, and will be ample for all requirements when we multiply the capacity of our concentrator, and this we expect to do at no distant date. The water is brought from the head of a waterfall in a 2 feet by 4 feet flume along the side of a canyon, over a trestle 70 feet high, across Glacier Creek and along the mountain side to the mill, a total distance of 1,400 feet, the effective head being 100 feet. Owing to the fact that there was a large tonnage of ore in the mine available for stoping, and our camp facilities were being taxed to their utmost capacity to provide accommodation for tramway employees and others, it was considered inadvisable to carry on an energetic campaign in the mine during the summer.

No. 1 Tunnel was advanced 110 feet to a total length of 180 feet, 35 feet of cross-cutting was also done in this tunnel, which, with the exception of a few feet, where purely local distorted conditions prevailed, may be said to be all in good ore. No. 2 tunnel is 124 feet in length, and, with the exception of a few feet of what might be termed low grade concentrating ore, is also all in good ore. No. 3 tunnel was advanced 65 feet to a total distance of 300 feet, and a raise and crosscut connecting Nos. 3 and 2 tunnels were completed. At 280 feet from the portal of No. 3 tunnel a splendid body of ore was encountered, the development of which will be vigorously prosecuted this winter. This ore body is the downward continuation of that disclosed in Nos. 1 and 2 tunnels and carries the same or better values, native silver and argentine being fully as conspicuous as in Nos. 1 and 2 tunnels.

Your directors have no hesitation in assuring the shareholders that they consider the property one of the most promising in British Columbia, and there is absolutely no doubt but that substantial dividends should be paid when the complete plant has been in operation for a reasonable period."

NORTH STAR CO. INTERIM REPORT.

The following interim report has been mailed to the stockholders of the North Star Mining Co., Ltd.:—

The directors are able to announce that the long-continued exploration work now shows a measure of success.

Under date of the 20th December, 1909, Mr. Curran, the manager at the mine, reports as follows:—

"The ground adjoining the north incline is being opened out in three different places, 100 feet apart. Total length of ground now being explored, 300 feet. At each place we have found good shipping ore, principally carbonates, but underlying the carbonates is a body of sulphate ore. This body of sulphate ore has not yet been explored."

Later, the manager reports that "work done at these points has materially improved the extent of the carbonate ore. This ore is all the way from three feet thick, and the value of the metal contents is improving as the work advances."

It is not possible so far to make any estimate of the extent or value of this newly found ore.

STATISTICS AND RETURNS

MINERAL OUTPUT OF NOVA SCOTIA FOR 1909.

Preliminary estimates of the mineral outputs and metallurgical products of Nova Scotia for the year 1909 are as follows:—

Coal	$14,200,000
Coke	2,000,000
Gold	250,000
Gypsum, limestone and other materials	750,000
Stone and building materials	1,100,000
Pig iron	1,100,000
Steel	4,250,000
Steel rails, rods, etc.	9,500,000
	$33,150,000

DOMINION COAL COMPANY, LIMITED.

Wettlaufer	.....	224,700

Ore shipments to December 31st from January 1st are 60,196,932 pounds, or 30,098 tons.

Total shipments for week ending December 31st are 1,714,019 pounds, or 857 tons.

The total shipments for 1908 were 25,463 tons, valued at $10,000,000.

MARKET REPORTS.

Metals.

Jan. 10th (Quotations from Canada Metal Co., Toronto):—
Spelter, 6½ cents per lb.
Lead, 3.75 cents per lb.
Antimony, 8½ to 9¼ cents per lb.
Tin, 35¾ cents per lb.
Copper, casting, 14¼ cents per lb. (market active and strong).
Electrolytic, 14¼ cents per lb.
Ingot brass, 9 to 12 cents per lb.

Jan. 10.—Pig Iron (Quotations from Drummond McCall Co.):
Summerlee, No. 1, $23.00 (f.o.b. furnace).
Summerlee, No. 2, $22.50 (f.o.b. furnace).
Midland, No. 1, $22.00 (f.o.b. furnace).
Coal—Anthracite, $5.50 to $6.75.
Bituminous, $3.50 to $4.50 for 1¼-inch lump.

Coke.

Jan. 5th.—Connellsville Coke (f.o.b. ovens):—
Furnace coke, prompt, $2.65 to $2.75 per ton.
Foundry coke, prompt, $3.10 to $3.25 per ton.

Jan. 5th.—Tin (Straits), 33.40 cents.
Copper, prime Lake, 14.00 cents.
Electrolytic copper, 13,80 cents.
Copper wire, 15.25 cents.
Lead, 4.70 to 4.75 cents.
Spelter, 6.25 cents.
Sheet zinc, 8.50 cents.
Antimony, Cookson's, 8.50 cents.
Aluminium, 21.75 to 23.00 cents.
Nickel, 40.00 to 49.00 cents.
Platinum, $29.50 to $33.25 per oz.
Bismuth, $1.75 per lb.
Quicksilver, $52.50 per 75-lb flask.

Metal Movements During 1909.

The following table shows the highest, lowest, and average prices of metals for the year 1909:

	Highest.	Lowest.	Average.
Straits Tin, New York	34.12½	27.30	29.76
Lake Copper, New York	14.62½	12.75	13.39
Electrolytic Copper, New York	14.37½	12.25	13.11
Casting Copper, New York	14.25	12.10	13.02
Cooksons Antimony, New York	8.62½	7.87½	8.27
Pig Lead, New York	4.75	3.95	4.30
Spelter, New York	6.50	4.75	5.52

Boston, January 6.—There were sales of Lake Copper made yesterday at 14⅛c, and Boston copper interests refused to sell at that price. Electrolytic is quoted about 13⅞ to 14c.

Messrs. Samuel Montagu & Co. report, December 24th, 1909, as follows regarding silver:—The market has been rather more animated, with a good tendency. The support has been chiefly from the Continent, with very little competition. Consequently, the price has been largely dependent on the amounts offering, especially as the quotation has been maintained over Eastern parities. The fluctuations have also been assisted by speculative operations, for which wide movements are a tempting bait. The stock in Shanghai stood, on 13th inst., at 164 lacs of sycee and 1,875 bars. There was a falling off in 1908 of £21,000,000 in the total foreign trade of China, and as the total imports fell off £15,000,000, against £6,000,000 reduction in exports, the net difference of £9,000,000 readily accounts for the huge stock of sycee in Shanghai and the bars held for China account in London. A shipment of £30,000 has been made from San Francisco to the Far East. The quotations yesterday were 1-16 above those quoted a week ago.

5 Important New Books

Cost of Mining

BY JAMES RALPH FINLAY. 415 *pages,* 6x9, *illustrated,* $5.00 (21s.) *net, postpaid.*

An economic investigation of those principles upon which scientific, profitable mining is based. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metals discussed. Detailed analyses cover costs of mining *coal, iron, lead, zinc, copper, gold and silver.*

CONTENTS: Value of Mining Property. Factors Governing Variations. Partial and Complete Costs. Statistics of Coal Production. Cost of Mining Coal. Cost of Mining Lake Superior Iron. Occurrence and Production of Copper. Lake Superior Amygdaloid Copper Mines. Conglomerate Copper Mines of Lake Superior. Copper Mines on Fissure Veins in Montana, Australia and Arizona. Various Copper Mines of Arizona and Mexico. Copper Mines in various other Districts. The Copper Mining Business in general. Lead. Silver-Lead Mining. The Cost of Silver-Lead Smelting. Zinc Mining. Occurrence and Production of Gold. Quartz-Pyrite Gold Mines. Cripple Creek, Kalgoorlie and Goldfield. Silver Mining at Cobalt and Guanajuato.

Principles of Mining

BY H. C. HOOVER. 200 *pages,* 6x9, *illustrated,* $2.50 (10/6) *net, postpaid.*

Part I deals fully with the determination of value, prospective and in sight—the sizing up of the mine and in this Mr. Hoover's work has been extensive and highly successful.

Part II discusses the development of tunnels, shafts, crosscuts, etc., with chapters on mechanical equipment and efficiency.

Part III. Administration of Mines with all the problems of labor efficiency, labor unions, wages, working costs, accounts, division of expenditure, etc.

These are all specialties of Mr. Hoover.

Timbering and Mining

BY W. H. STORMS. 300 *pages,* 6x9, *fully illustrated,* $2.00 (8/6) *net, postpaid.*

A simple practical book on timbering and mining. It gives an account of the best American practice, compiled from data collected by the author at the mining centres of the country. It covers all phases of timbering, timber preservation, drift sets, structural steel, shaft sinking, drainage, bucket dumping, head frames and a hundred other important points.

Electro-Magnetic Ore Separation

BY C. GODFREY GUNTHER. 193 *pages,* 6x9, *fully illustrated,* $3.00 (12/6) *net, postpaid.*

The great variety in method and practice makes this book, with its full treatment, especially valuable. The underlying principles, their application and the machinery and plant are fully covered. Both strongly and feebly magnetic minerals are treated.

CONTENTS.—Introduction. Magnetism Applied to Ore Dressing. Principles of Magnetic Separation and Preparation of the Ore for Treatment. Separators for Strongly Magnetic Minerals. Separators for Feebly Magnetic Minerals. The Concentration of Magnetic Ores. The Separation of Pyrite and Blende. The Separation of Siderite from Blende. Separation of Miscellaneous Ores and Minerals.

Ore Dressing

BY ROBERT H. RICHARDS. Professor of Mining, Massachusetts Institute of Technology.

Volumes III and IV, per volume $5.00 [21s.] net postpaid. The set, 4 volumes, $20.00 [£4 4s.] net, postpaid.

Volumes III and IV supplement but do *not supplant* Volumes I and II. The Chapters supplement without repetition the corresponding chapters in the earlier volumes, describing new machines, new processes and giving new data.

Volume III discusses fully fine grinders, particularly tube mill and grinding pans, rectilinear tables of the Wilfley type, the questions of magnetic and electrostatic separation and flotation processes, while Volume IV describes in detail many up-to-date mills, their methods, cost of operation, machines, power and water plants, etc.

The index to all four volumes now ready. It will be supplied free to purchasers of the entire set or volumes III and IV.

We Can Supply Any Engineering Book In Print.

BOOK DEPARTMENT **Canadian Mining Journal**

Confederation Life Building, Toronto

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

A CROWN MINERAL PROPERTY

Suppose the Government should say to you there is a property worth $10,000. We will sell it to you for $10,000, payable in 20 annual instalments and won't charge interest on deferred payments. In event of your death at any time during the 20 years, we guarantee to cancel the balance due and execute a warranty deed to your wife, or if she prefers, we will pay her $10,000 in cash. If you live to complete all payments, we will pay you $10,000 cash, plus interest earned on your annual deposits. Chances are you would jump at it. We are making just such an offer backed by assets of over $45,000,000. Better investigate it.

Second Edition With New Material

Simple Mine Accounting

By David Wallace

78 pages, 6x9, with forms. $1.00 (4/6) net postpaid.

Some very good material has been added to this excellent little book. It has some new sections on card systems for warehouses, shipping documents, sheets of costs and profits, etc , etc.

From the first publication the book has proved most useful to every Superintendent or Mine Manager who wasn't an expert accountant and whose business wouldn't warrant employing one.

It is essentially *simple*. It shows how to develop the ordinary books and systems of a small mine (or a large one) so as to preclude the slipshod, inaccurate methods which are so expensive to every business. It isn't an expert accountant's book, but it shows how to keep records that are accurate and tell the real facts.

BOOK DEPARTMENT

Confederation Life Bldg. - TORONTO

CANADA.—DEPARTMENT OF MINES.

GEOLOGICAL SURVEY

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

MARITIME PROVINCES

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

QUEBEC

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

ONTARIO

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

THE NORTH WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.

THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

CANADA

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet.
1025. Waverley Sheet.
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

ONTARIO

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

YUKON

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

REPORTS

1072. Summary Report of the operations of the Geological Survey for year 1908.
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.
1075. Gowganda Mining Division, 1908. W. H. Collins.
1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

GRAND TRUNK RAILWAY SYSTEM

The Longest Continuous Double Track Railway in the World Under One Management.

The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

The "International Limited" (Canada's Railway Greyhound)

The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT TORONTO KENORA WINNIPEG, MAN.

BUY YOUR OUTFIT AT SIMPSON'S

We'll supply you with an outfit complete from tent to pick-hammer.

We'll pick out a prospector's outfit for *travelling light* or an outfit for *developement work* at a stationary camp. Don't overload yourself. We can help you choose what you really need and we can do it at a minimum expense.

THE SIMPSON MINER'S KHAKI DUCK SHIRTS.

A Shirt with "no end of wear." A Shirt made of the strongest khaki duck—in the strongest kind of way—by men who are highly experienced in miners', surveyors' and prospectors' outfits. Buying these shirts in very large quantities, we are able to offer you a shirt worth in every way a $1.50 for - **One Dollar per Shirt.**

Miners', Surveyors' and prospectors' shirts, heavy khaki duck collar, two pockets with buttoned flaps, dome fasteners, sizes 14 to 18. Our special value at **$1.00.**

OUR SPECIAL UNDERWEAR FOR MINERS.

We recommend heavy pure wool, the kind that feels warm and is warm, all the time, whether wet with perspiration or not. Try our heavy all wool with just a little camel's hair mixed with it—making a very soft garment next the skin, and giving "the highest degree imaginable," of cold weather protection and comfort. This underwear we specialize at - - - - **One Dollar per Garment.**

SIZES 34 to 48.

OUR SPECIAL TARTAN FLANNEL SHIRTS.

The cashmere flannel in these garments can only be made in Glasgow, Scotland. We import it in large quantities and have it made by skilled workmen into shirts to our own specifications, making the price of the very best quality only **$3.00 per shirt.**

Men's, all wool, cashmere, flannel, tartan, shirts, made with reversible collars, and pockets, genuine fabric, best tailoring, they fit perfectly in every way. Our Special Price is - - - - - - - - **$3.00.**

HARDY PATENT UNIVERSAL PICKS

This illustration shows the Hardy Patent Universal Picks which are made entirely of steel.

Everyone interested in the use of picks for any purpose, who has tried the Hardy Patent Universal, readily admits that it is the best—the Collier, the Metal Miner, the Prospector, the Road Mender, the Sectionman, the Manager, the Engineer, the Blacksmith and the Purchasing Agent, each in his sphere of work admits without qualification that the Hardy Patent Universal Pick is the best Pick that can be obtained, and that it saves work for the user and money for the owner.

If you have not tried the Hardy Universal, you should get a sample without delay.

INDUCTION MOTORS
IN
CRUSHING & CEMENT PLANTS

Polyphase Induction Motors have many advantages in the operation of rock crushers, ball mills, tube mills, rotary kilns, hoists, conveyors, pumps and other machinery. In addition to flexibility and economy, demonstrated in many other lines of service, electric drive eliminates long lines of counter-shafting, a specially desirable feature where gritty dust makes the maintenance of both belts and bearings very expensive.

In the dusty atmosphere of a cement mill the simple squirrel cage rotor of an induction motor is much less liable to give trouble than the wound armature of a direct current machine. The illustration shows one of our 100 H.P. type "AN" induction motors belted to a tube mill at the Belleville Plant of the Canada Cement Company Limited. The equipment of that plant includes over 1,000 H.P. of our motors.

SULLIVAN DIAMOND CORE DRILLS

Sullivan Class "R" 300-foot Electric Diamond Drill in operation underground in West Australia.

IT IS EASIER to string wires than to lay pipes or haul boilers. So there are many cases in which electricity is more convenient than steam or air for operating Diamond Drills.

Sullivan Electric Diamond Drills are made in any capacities, for either direct or alternating current. Their compactness and adaptability permit operation either underground or from the surface. Holes bored at any angle.

THE OLEAGINOUS MR. HENSHAW MADDOCK.

Mr. Henshaw Maddock occupies Suite 9, 10, 11, No. 205 Yonge Street, Toronto. Also he occupies a great deal of advertising space in our dailies. From his portrait, of which he is justly proud, we judge that Mr. Maddock is a person of engaging manners, and of convincing speech.

Mr. Maddock is promoting the sale of shares in the California-Alberta Oil Company. Some time ago we filed away for future reference, a copy of his prospectus. It is quite possible that this prospectus would have remained innocently in the file, had not our correspondent drawn our attention to one or two inaccuracies contained therein.

After pursuing the California-Alberta Oil Company prospectus, and comparing it with our correspondent's letter we are led to believe that Mr. Maddock does not know what he is talking about—or does not care to know.

For instance, on page 7 of the prospectus, a quotation from a report, dated 1898, is credited to Dr. G. M. Dawson, The report was written by Mr. J. B. Tyrrell.

Another quotation, page 8 of the prospectus, is attributed to the Summary Report of the Geological Survey of Canada, 1905, page 7. No such statement is made in the Summary Report. Indeed, any official of the Survey making such a statement would lose his usefullness at once. The quotation reads thus: "The same oil belt was traced into the Athabasca regions, 250 miles north of Egg Lake, showing vast deposits of asphaltum, or tar sands in the Athabasca region." If Mr. Maddock does not realize that he is talking nonsense, we must seize this opportunity of informing him that such is the case.

On page 8, moreover, the reader is told that the Canadian Government pays a bounty on crude oil. This is perfectly true. Unfortunately the Canadian Government, in its blindness, insists that you must first get your oil.

In many other respects the prospectus before us is a network of silly exaggeration. We may be pardoned if, since Mr. Maddock has seen fit to misquote Dr. Dawson, we reproduce here exactly what Dr. Dawson did write of the Egg Lake district. Here it is:—

"It does not follow however, that this would be a specially favourable locality in which to test the beds of the lower Cretaceous by boring, for on the contrary our knowledge of the geological structure of this part of the country indicates that the depth at which these beds lie, is here very great, probably, at least 2,500 feet, and possibly much more" Our correspondent continues thus: "After this was written the well at Victoria had

to be abandoned at 1840 feet, without reaching the lower Cretaceous (supposed oil bearing rock). A private well near Morinville is now down, somewhere near 1900 feet, without reaching it, and two wells near Calgary are down 3,400 feet, without reaching it. It is only fair to state, however, that at Calgary there is a greater thickness of overlying formation than is to be expected near Edmonton. At Pelican, 150 miles north, there is only about 800 feet of overlying formations to penetrate, and going eastward the overburden also rapidly thins down."

In short, we may safely conclude that Mr. Maddock and his associates are trading upon the exploration work, actually being done in Alberta by competent men. A conclusion even more safe for Mr. Maddock is that it is time for him to shut up shop.

THE QUARTERLY BULLETIN OF THE CANADIAN MINING INSTITUTE.

Two years have passed since the Council of the Institute decided to publish the technical papers contributed by its members in the form of a regular quarterly bulletin. The experiment was eyed with disfavour by not a few. It was considered that the annual volume satisfied all needs, and the added expense was unnecessary.

However, the judgment of the Council has been vindicated. The Quarterly Bulletin, has not only been well received, but it has kept interest continuously alive. It has bridged the twelvemonth gap between meetings.

We have before us Bulletin No. 8, for December, 1909. Its contents warrant more than casual commendation. Within its covers are no less than fifteen papers. Papers that in all essentials conform to the highest standards.

Particularly impressive is the variety of topics presented. Shaft sinking, ore sampling, coal, copper, iron, chrome, dynamite, are among the subjects indicated by the titles. Several essays on general questions are to be found. In fact this diversity is a most marked and creditable feature of this particular bulletin, also it is exceedingly difficult to attain. Only suffering editors know the depths to which the average mining man will descend rather than write an article. He promises with fervour. He postpones with equal fervour. But perform he will not except as a dernier ressort. Yellow bate allures him not. Therefore, when Mr. Secretary Lamb lands a basketful of fine fish on bare hooks we take off our hat.

Eight of the fifteen papers are contributed by students. We have compared these with the student papers of former years, and we have no hesitation in declaring in favour of this year's crop.

The gold medal, awarded annually to the student whose paper is considered worthiest, was this year awarded to Mr. N. L. Bowen, of the Kingston School of Mining. The second and third prizes went to McGill students. The task of judging the essays must have been peculiarly trying.

The policy of inciting students to honourable competition is wise. The Institute can hardly overdo this.

As for the other papers, it suffices to say that they are uniformly good. Noticeably timely is Dr. Fernow's "The Relation of Mining to Forestry." This and other papers we shall discuss more fully at another time.

It is only necessary to add that praise is due Mr. Lamb for the care and discrimination with which he has edited the Bulletin. The Canadian Mining Institute has every reason to be proud of its publications.

AN INDISCREET OFFICIAL.

Discretion is a virtue without which a Government official cannot thrive. Dominion officials are paid servants of the nation. Dr. Eugene Haanel occupies a very responsible and important position. He is Director of the Mines Branch of the Department of Mines. In this capacity his duty is to aid the mining industry to the best of his ability.

A few days ago, at Ottawa, Dr. Haanel publicly criticized the metallurgical methods of the Canadian Copper Company. His criticisms were strong and, we believe, unjust. But, in any case, Dr. Haanel has neither the right nor the technical knowledge to offer criticisms on one of the most modern and most effective metallurgical plants.

Before going further, we may state that we hold no brief for the Canadian Copper Company. Our columns are open to any fair comments on that company. Our position, however, is this: Dr. Haanel, as a public servant, has openly attacked a large industry. Dr. Haanel has therefore laid himself and his Branch of the Department of Mines open to criticism. And incidentally, there is evidence of growing dissatisfaction with the work of the Mines Branch. It now devolves upon Dr. Haanel to substantiate in detail his strictures upon the methods of the Canadian Copper Company. He must show cause, or make instant retraction. We need hardly point out that the Hon. Mr. Templeman, as Dr. Haanel's immediate superior, is strictly accountable for the vagaries of his subordinate.

We shall look forward to Dr. Haanel's explanation with much interest.

RAILWAY STATISTICS.

Government returns concerning the freight traffic on Canadian railways throw light upon the part that mining plays in the industrial life of the Dominion.

During the year ended June 30, 1909, the total freight carried on the 24,104 miles of Canadian railways amounted to 66,842,258 tons—formidable figures indeed. We find under the heading "Products of Mines" 35.81

per cent. of this total, or 23,931,061 tons. In other words, the mining industry provides more than one-third of all the freight moved by our railways.

Comparing mining with agriculture, the returns shew that to the latter industry can be attributed hardly 50 per cent. of the tonnage credited to the former. Products of forests almost equal those of agriculture, both standing at less than 18 per cent. of the total freight moved. Manufactures account for 11.82 per cent.; products of animals, merchandise, and miscellaneous materials making up the balance.

The items classified as products of mines are anthracite coal, bituminous coal, coke, ores, stone, sand, and "other products." The last vague item forms an inconsiderable part of the whole. It is to be noted that cement, bricks, lime, and all metallurgical products are excluded. Nor is petroleum, which is essentially a mineral, included.

We often wonder if our railway corporations really know how dependent their enterprizes are upon the mining industry. The figures above quoted are certainly well within the truth. Probably any different classification would place mining in an even higher position. But as they stand they are eloquent enough.

A COMPARISON.

One of the most irritating fictions, and one that is constantly reiterated, refers to mining. It is popularly believed that mining is essentially a dangerous calling. No amount of reasoning convinces the lay mind that this is not the case.

A comparison of statistics may convince where reasoning fails.

More than eighteen thousand men are employed in the collieries of Nova Scotia. During 1908 there were 41 fatal accidents at these collieries. To be exact, there were 2.2 men killed for each 1,000 employed.

Last year the railways of Canada employed 19,443 trainmen. Of these 113 were killed. That is, the fatality rate was 5.8 per 1,000 men employed. As this is considerably more than twice the rate obtaining in Nova Scotian collieries, the moral is obvious.

THE BARTLETT FIASCO.

To no Gowganda prospect was so much newspaper puffing given last winter, as to the Bartlett. The mine has now been closed; the promoter has been exposed; and the shareholders are wondering where they come in.

Comment is superfluous. Incompetent technical management, and prodigal waste at headquarters always bring the one result. But, there yet remains the consideration that the men who permitted their names to decorate the prospectus, are morally and legally liable. The Hon. Mr. Harcourt and his fellow-directors, if they wish to retain the respect of honest men, will assuredly come to the rescue.

EDITORIAL NOTES.

The annual meeting of the Canadian Mining Institute will be held at the King Edward Hotel, Toronto, on March 2, 3 and 4. A fine list of papers has been promised. All arrangements have been completed as to special railway rates, accommodation, etc.

In a review of last year's silver market, reprinted on another page, Messrs. Samuel Montagu & Co., point out that even if a gold standard were to be adopted by China, the demand for silver would not be seriously affected. The development of the Empire's internal wealth will provide a growing market for years to come.

HOUSE CLEANING APPLIED TO MINERAL LANDS IN ONTARIO,

By G. R. Mickle.

In the Ontario Gazette of December 18th ult., and in the three successive issues appears a long list of lands in default of taxes and therefore subject to forfeiture on the 30th of June 1910, if the taxes are not paid before that date. This is the first systematic clean-up since the province made its first grant of land as mining land in 1852 about two generations ago. It is true there have been tax sales under the Algoma Land Tax from time to time, but this act did not apply to the whole province.

It will be noticed that the parcels of land advertised are of all sizes from the 10 sq. mile or 6,400 acre location of the early days down to fractions of 10 acres. Fancy granting an area equal to 160 claims of 40 acres in one block! These lands, which the present owners take no interest in, no doubt once represented great hopes. The fact that they now revert to the Crown is a striking illustration of the gulf often fixed between Expectation and Fulfilment.

Taking the list as a whole it will be seen that 247,037 acres are in arrears for taxes or about 29 per cent. of the total area subject to the Supplementary Revenue Act under which the tax is levied and the lands become subject to forfeiture. In a paper read by me before the Canadian Mining Institute last annual meeting, the working of this Act was fully explained. It applies only to mining lands in territory with no municipal organization. The policy long since abandoned, of selling outright large areas has evidently only resulted in tying-up a large amount of land for a long time to the benefit of no one.

By districts the areas advertised as subject to forfeiture are as follows:—

Kenora and Rainy River Districts	4,072	"	"	29%	"
Thunder Bay District	96,371	"	"	23%	"
Algoma District	36,336	"	"	30%	"
Sudbury District	18,230	"	"	22%	"
Nipissing District	5,249	"	"	37%	"
Parry Sound and Muskoka Districts	4,072	"	"	29%	"

Since the list was first published the area in Kenora and Rainy River has been somewhat reduced by the payment of amounts due.

It may be anticipated that before the 30th of June the number of acres will be further diminished, and that finally something like 200,000 acres will probably revert to the Crown. This should stimulate prospecting in the Western part of the Province where most of the land that will be revested in the Crown lies. It is to be hoped that some valuable discoveries will be made as a result.

POLITICAL AND MISCHIEVOUS INTERFERENCE WITH INDUSTRY.

Written for the Canadian Mining Journal, by J. J. Harpell.

One of the most disastrous conditions into which a country and its government can drift is that which forces companies and other corporations to keep representatives in the government lobbies and to retain the services of legal lights in order to protect their interests from the interference of men who are actuated by the hope that these companies and corporations may find it to their advantage to quiet them by purchasing something that they have to sell or in some other way remunerate them for their silence. Legislation and investigation, and the rumours of both, that proceed from the work and talk of the mysterious men who are advertised as representing foreign governments or as speaking for large amounts of capital that are ready to be invested in Canada if such and such legislation is passed, result in more harm than good.

A short time ago considerable publicity was given to the rumour that an export duty would shortly be put on Canadian asbestos in order to compel its further manufacture within the country. The effect of this rumour has been to increase the efforts of the foreign manufacturers to look for their supplies elsewhere in order to be independent of the Canadian material.

The rumour that is now being featured on the front pages of our dailies and receiving considerable attention in their editorial columns, is that something is to be done to prevent the large and increasing exports of nickel. This rumour seems to have emanated from a man, of whom little is known, who claims that the present producers of nickel, by keeping up the price of the metal, make it difficult for other capital to be invested in the industry. One would think that this fact would encourage the investment of more capital rather than deter it. He claims that nickel can be manufactured for much less than is admitted by the present producers, yet he advocates that the Government should subsidize the industry by means of bounties. According to the Globe of Jan. 20th, he advises, "that in the interests of the Dominion and the Empire as a whole, the Canadian Government should step in and take over the ownership, or otherwise provide for Government control of these nickel deposits [the Sudbury nickel deposits] . . . as a matter of imperial urgency it was important that Great Britain should be placed in a position of advantage over all other countries by securing control of the world's nickel resources, both from the standpoint of naval supremacy and from the standpoint of industrial development. At present the trust, by keeping down production, kept the price of nickel so high that practically only governments were able to purchase it in anything like large quantities." How ridiculous and imaginary do these statements appear in the light of the following facts:

1st. At present Canada produces only about sixty per cent. of the world's consumption of nickel.

2nd. The present holdings of the so-called nickel trust in Canada comprise but a small part of the known nickel deposits of the Dominion. Thus there is ample opportunity for this expert and his cheaper process to produce nickel independent of the present producers. If the buyers of nickel are being held up, as he claims, they will be very glad to buy what he has to offer at a lower price.

3rd. British interests at present have a large share in this so-called nickel trust. In some quarters it is believed they control it. The remainder is owned by citizens of Great Britain's most trusted ally.

4th. Apart from the nickel required for coinage, governments do not purchase nickel.

5th. The British Navy Yards build war vessels for any country from which they can get a contract.

Unfortunately, the agitation which this nickel expert is creating is apt to impress the man in the street, because the manner in which the Dominion Government treats the Canadian nickel production has left him with very false notions of the profits which the producers of nickel are making. According to the report of the Bureau of Mines of Ontario, in which province all the Canadian nickel is produced, the value of the nickel production for 1908 was $1,866,059. But according to the Dominion Government reports it was $8,224,180. The difference between these two amounts is due to the fact that the Ontario valuation represents the value of the nickel as it is exported from Canada, while the Dominion valuation is arrived at by multiplying the number of pounds exported by the quoted price of refined nickel in the markets of the world. It is assumed that this price in 1908 was 43 cents. This figure is so far from being the actual price received by the producers that it would be nearer the truth if it were cut in two. Why the Dominion Government should place the nickel producers in such a false light it is difficult to understand, unless the very serious falling off in Canadian exports and production of almost all commodities has forced it to take advantage of every opportunity to inflate.

Another feature of the agitation that is bound to impress the man who has no more information than what he gathers from the daily papers, is the attempt which a Government official, in a speech before the Conservation Commission, made to discredit the excellent work that is being done by the Canadian Copper Company, the largest producer of Canadian nickel. This company, without the slightest assistance from the Canadian people in the way of either bonuses or tariffs, has built up the finest and most up-to-date nickel mining and smelting plant in the world. It is to the efforts and energy of this company more than any other that Canada owes her proud position of being the largest nickel producer in the world. This company is now supplying regular employment to some 1,500 Canadian workmen. But, notwithstanding these facts, Dr. Eugene Haanel, Director of the Mines Branch of the Department of Mines, has seen fit to say that this company employs "an inconsiderable number of men," and uses a process that is "extremely wasteful."

For the last ten years the mining men of Canada have tolerated Dr. Haanel with an indulgence that is eloquent in its prayer for a strong reforming hand or the sickle of Father Time. During this time the mining industry has suffered much from the work of his department. One example will suffice. About the year 1900 Canada was producing over ninety per cent. of the world's consumption of the superior grades of

asbestos. At present she is producing not more than sixty per cent. of these grades. The period at which the change began to set in is coincident with the date at which Dr. Haanel's department began to be interested in the industry. From that time there has been company promotion and flotation at the expense of development and production, and a wide distribution of promoters' literature of a kind that has done much to hurt the market for the Canadian material. The manner in which a subordinate, working under Dr. Haanel, has lent himself and the prestige of his office to this company promotion, and personally profited by it, is a disgrace to the civil service of Canada. Under the guise of a Government official he entered upon and examined freehold properties, manipulated until he got advantageous options on them, and then sold them to company promoters.

Asbestos and nickel are two of the very few industries of Canada that have been built up to exceptional proportions entirely on their own merits. They have had none of those artificial assistances such as bounties or tariffs, which in other industries have meant such a tax and drain on the country. On the contrary, they have both been taxed by provincial and local authorities. The success which both have attained has done much to advertise the exceptional mineral wealth of the Dominion. In both cases the markets for the products have had to be found outside of Canada. In both cases the problems of mining, manufacturing and marketing had to be solved for the first time. There was little to be gained from the experience of the past in this or other countries, because they were new industries.

On the whole these are industries of which the people of Canada should be proud, and grateful to those who have made them. Instead of allowing them to be bled, or hampered by the proposals of dreamers and company promoters, they should be protected and encouraged, and everything done to permit them full and free development under the most natural and advantageous conditions. By this is meant that everything should be done which would improve the facilities and rates of transportation, banking and the costs and conditions of living.

What is the Dominion Government doing to assist the industries of our country in this respect?

Nickel ore can be profitably mined in New Caledonia, transported some 12,000 miles, and delivered in the ports of Great Britain and other European countries for about $8.50 a long ton, or about the cost of transportation alone of ore from Sudbury to the European markets, a distance of only 3,500 miles. Proportionate to the distance, the freight rates on Canadian asbestos are equally exorbitant. It costs more to ship a ton of mica from Ottawa to Montreal than it does to bring the same quantity from India to New York. India is Canada's greatest competitor in mica. China Clay enters into competition with Canadian talc in a number of important uses, yet China Clay from France or England is carried from either St. John, New Brunswick, or Montreal, to Windsor, Ontario, for much less than talc is carried from Madoc, Ontario, to either Windsor or St. John. All other Canadian ores are equally handicapped in the matter of freight rates, notwithstanding that Canadian railways and transatlantic steamship companies have been much more heavily subsidized than those of any other country.

In passing through the port of Montreal for export, a ton of feldspar worth about three dollars, pays the same port tariff as does a ton of tobacco leaf coming into the country. The tax on a ton of nickel ore or mica is considerably higher. The whole schedule of Montreal port charges seems to have been compiled with little idea of how it might interfere with the export of low-priced products, particularly ores. In view of the importance of encouraging the development of our natural resources there is little to support a policy which imposes any port charge on exports, and less to support a charge that amounts to over five per cent. of the value of the goods, particularly when there are no facilities for transhipping, and when the goods are transhipped over side of the vessel in the harbour without being landed on the wharf. Most other countries whose products enter into competition with those from Canada in the markets of the world have free ports.

But one of the greatest injustices to exporters of Canadian products lies in a system that is maintained by the transatlantic shipping combine, by which a special tax is imposed on the purchasers of Canadian goods entering the port of London. This tax is known as the "London Clauses" charge. The conditions of this charge and the rates of tax it imposes, are to be found on all Bills of Lading issued in Canada. This tax is levied only on goods coming from Canada and the United States. Although it is generally paid by the purchaser, yet it comes out of the exporter, because he is forced to accept prices for his goods lower by the amount of these "London Clauses" charges than those received for similar goods from any other part of the world. Feldspar from Sweden, mica from India, or talc from France and Italy, comes into the port of London free, but similar material from Canada is taxed 42 cents a ton. Cheese from New Zealand or Denmark or Holland comes into the port of London free, but cheese from Canada pays 79 cents a ton, etc. In the case of some low-priced commodities this tax is sufficient to shut out the Canadian article. The port of London authorities receive no part of this charge. It is all returned to the shipping companies that carried the goods from Canada.

In the matter of banking accommodation, the Canadian producer and exporter is also handicapped. On his discounts and accommodations he pays a higher rate of interest than his competitor in any other country. During the last few years Canadian exporters have been unable to get their drafts, drawn against Bills of Lading, discounted for less than six per cent., and in many cases they paid seven. In most other countries similar commercial paper is discounted at from 2½ to 3 per cent. Loans to the producer of either mineral, agricultural, or other commodities are made at rates between seven and nine per cent. In most other countries such loans seldom exceed five, and in most cases are made at rates not exceeding four.

It is, to say the least, an insult to the intelligence of the people of the Dominion for the Canadian banks to attempt to justify their excessive foreign call loans by claiming that they have more money than they know what to do with, and at the same time charging the industry of the country the excessive rates they do.

Money and credit is the life-blood of industry, and the banking systems the veins through which it flows. If the money is drawn off from any country or community the industries in that country or community become sluggish or dry up. The more successful and active industry becomes, the more does it require money. The agricultural communities of France are among the most successful and wealthiest of any in the world. Yet the laws of France are framed so that the French farmer can borrow money at low rates of interest. By its charter the Bank of France is required to lend

40,000,000 francs to the co-operative agricultural banks, free of interest. These in turn lend it to the farmers at rates not exceeding three per cent. The agricultural and other producers of Germany and Denmark get their loans at 3 and 3½ per cent. Those of New Zealand and Australia never pay more than 5, and the greater part is borrowed at 4¼ per cent. The Canadian banking system, on the contrary, is built, and proceeds upon the principle that the success of any community is measured by the amount of bank deposits which that community contributes to the money centres of the world. According to the May bank statement, the foreign call loans of the Bank of Montreal were $90,440,910, or $3,747,317 more than all the savings deposits which the Canadian people had in that bank at that time. Now there are communities which are entirely dependent upon this bank for their accommodation. How can any bank in such a condition be expected to give it?

Of course, they do not give it, and they avoid direct refusal by exacting an exorbitant rate of interest and by questioning the security offered. There are two reasons why the Canadian banks prefer to loan in the stock markets on call. 1st. In time of dear money they get a higher rate of interest, and, 2nd, in times of cheap money they profit by the increase in the value of stocks, in which the Canadian banks are always large speculators. The people of Canada and its Parliament will make a great mistake if they permit a revision of the Bank Act without first appointing a Royal Commission to thoroughly investigate the workings of the Canadian banks and to carefully study the banking systems of other countries. The present Canadian Bank Act and its administration are sapping the life of the industries of Canada, while of our bankers it is making multimillionaires and penitentiary convicts, according as they succeed or fail in their stock speculations with the people's savings.

Another condition that is attaining alarming proportions and making the position of the producer almost unbearable is the increased cost of living. Owing to this the employer is being pressed by his workmen for higher wages, which, if granted, will increase the cost of his production and make it more difficult for him to sell his products in the markets of the world in competition with those from other countries that have been produced under conditions of lower costs of living. On the other hand, the employer recognizes how difficult it is becoming for his workmen to live on their present rate of wages. Those who have given this question only a superficial consideration are apt to charge the increasing cost of living to the avariciousness of the Canadian farmer. But a careful study of the question reveals nothing to support this contention. On the contrary, the Canadian farmer is suffering from the increase in the cost of living as much, if not more, than any other class in the country. Salaried officials have had their salaries increased. Labourers have had their wages raised. But the farmer, whose profits, even under the most favourable conditions, were never large, is compelled to work along as best he can without any such assistance, while he sees the costs of his living and production increasing much more rapidly than the price of his products and thus wiping out what little profit he used to make. The first to feel the pinch of such a condition is the poor and unscientific farmer, who, in order to make ends meet, begins to grasp at every opportunity to earn an extra dollar, and a diffusion of effort sets in that further aggravates the situation, and brings about a decrease in production. That the present high cost of living is due to a rapid decrease in the production of agricultural commodities may be gathered from the pages of almost every agricultural report issued. The effect of the increased cost of production on the Canadian farmer is much more fully dealt with in an article entitled "Canada and Tariff Reform," which the writer has contributed to the January number of the Contemporary Review.

Thus, from almost every point of view, conditions in Canada are becoming more and more difficult for industry to thrive, the products of which have to find a market outside of this country. To permit such industries to be harassed by political interference or to hamper them by unreasonable restrictive legislation, is to drive them out of the country just as soon as they can get their supplies elsewhere.

Moreover, it incites these industries to make special efforts to exploit foreign fields and discourages the exploitation of our own unprospected and undeveloped areas.

SOUTH LORRAIN.

Notes by Frank C. Loring.

Two problems in South Lorrain are; proper roads and cheap power.

The power problem will be solved by the advent of the "Mines Power, Limited," bringing electrical energy from Matibitchouan Falls. No expense has been spared in this enterprise. At present the sparse growth of wood, or coal brought from Haileybury at great expense, is utilized.

There is no summer road from South Lorrain to Cobalt, Haileybury, or elsewhere. Steamers supply transportation from Haileybury to Silver Centre, and from there to the mines, there is no means of transportation excepting roads which are a disgrace.

The Government has overlooked the enormous expenditures being made by various companies, and has not considered that district in its appropriation for road construction. It would seem that an enlightened policy would dictate the co-operation of the Government in solving the transportation problem.

The Keeley Mine, after having experienced considerable trouble because of insufficient gas producing facilities, has now overcome all difficulties and is operating with full force.

The Wettlaufer Mine, has completed constructions of station, at 140-foot level, and shaft has been sunk to 160 feet and is being timbered. Upon completion of the timbering, sinking will be continued, electrical power plant is to be installed.

On the Newman Mine a shaft is being sunk. Present depth is 45 feet. This is upon the vein, upon which the rich surface showings occur.

The Maiden Mining Co. is sinking a shaft on a large fissure in Keewatin and some very rich ore is being uncovered.

The South Lorrain Development Co., is about to start to tunnel some fourteen veins, which have been uncovered. These veins will be cut at between 200 and 300 feet, in depth.

On the Adair Mine a shaft is being sunk and from the hundred foot level a cross-cut will be made to intercept several veins known to exist on the surface.

On the Williams a boarding-an-bunk-house has been erected and a shaft is being sunk, present depth 30 feet.

On a number of other claims development work is being done, there is greater activity and far more genuine development work, than at any time in the previous history of the camp.

CONDITION AND NEEDS OF MINING IN THE YUKON.

Extracts from Speech of F. T. Congdon, M.P.

The resident of eastern Canada, and also of western Canada, for that matter, is so deeply engaged in the development of his own section of the country that he takes very little interest in anything beyond it. The common notion with regard to the Yukon territory, or of any other part of our northern territory, is that it is a great barren wilderness filled with icebergs, behind which the inhabitants are dodging and trying to keep themselves from freezing to death. A greater misconception never existed. The hon. member for North Toronto has never been able, in any speech made in this House, to mention the Yukon territory, or the officials of the Yukon, without saying something derogatory of them. He knows no more about the Yukon territory, about the conditions there, than Balaam's ass knows about the Hebrew grammar. Now, the hon. gentleman tries to belittle the Yukon territory by saying that it has a population of less than 8,000, probably 5,000. If it has only 5,000, I say they are one of the most remarkable 5,000 that has ever been collected together in any part of this mundane sphere. Imagine what would happen in the rest of Canada if every unit of 5,000 people added so greatly to the wealth of the country as the 5,000 people in the Yukon territory. Last year, and for several years before that, the gold production of the Yukon territory fell off. It was absolutely inevitable that it should fall off. In the earlier days there happened in the Yukon territory what happened in every other mining camp. Men flocked into the richest spots and these were capable of being worked. Men who knew nothing of mining, only enough to dig a hole in the ground, found a gold yield sufficient to make their fortune. But that ground naturally gets worked out in time, and if you could live in the Yukon territory and visit that ground which yielded these immense fortunes, you would see a gold-bearing ground which I believe is richer than in any other part of the civilized world. The area which can be worked to-day is ten times as large as the area which could be worked nine or ten years ago. The area is increasing in extent and, is so enormous that its output only depends upon the cheapness with which it can be worked. Now the hon. gentleman should remember this fact. He blames this government for the falling off of the gold yield in the Yukon. I do not think the hon. gentleman seriously meant to say that, but perhaps he did. But I say that the falling off of the gold production was exactly what has happened in every other country between the first wild rush when riches are dug out easily, and the second stage when scientific methods are necessary to get the gold out of the ground. Last year our production in the Yukon was a little over two millions, this year it has jumped up to $3,662,000. I venture to say that for the next ten years you will see an annual increase in the production of gold from placer ground alone with a continued improvement in the scientific mode of mining.

Now with regard to the government of the Yukon, and the reflections made by the hon. member on the government of that territory:—It must be remembered that in the beginning of the Yukon territory there occurred one of the most remarkable movements of men that has occurred since the Children of Israel started out from Egypt on their famous wanderings in search of easier work and better pay. That movement differed from all other movements that I know of. We had a large body of men moving together. Other movements of men were homogeneous; they were composed of men of the same language and the same ideas, and because of that fact it was easier to control and manage them than a movement such as this in which were represented every nation in the world, every trade, every profession, every occupation and every degree of morality. We had the pious deacon and the pick-pocket, and we had the preacher deserting for a time his sacred calling in the hope of being able to add to his poor stipend by striking a good claim. The worst feature of this crowd, numbering about one hundred thousand, was that while there were splendid men amongst it—no better could be found in the world—and while the large majority was eminently fit, capable, respectable and good, there was a lack of confidence in one section of the crowd with respect to the others. It might be that a man in a little group knew nothing whatever about other groups, and the consequence was that the crowd that rushed in there was filled with distrust of itself and of its different constituents. This naturally created in the government of this country, being guided, I suppose, by the reports of the authorities who had the management of this country, a distrust which was likely to grow. I do not think that any government will be greatly blamed if it takes pains to maintain the integrity of its territory. That is one thing that every government, whether British or Canadian, will protect. No government will take any chance in regard to the integrity of its territory. This government took no chance with regard to maintaining the Yukon territory as a territory of the Dominion of Canada. It sent into that country a force which I think was needless. But, it is easy to be wise after the event. Those 155 battleships that the British government "scrapped" a few years ago were unnecessary, but at the time they were constructed they were not unnecessary. They served a purpose and the fact that they were ultimately "scrapped" is no condemnation of the action of the government in constructing them at a time when they were believed to be necessary. This government sent into the territory a large force of the Northwest Mounted Police. No better force could have been sent, although I am not given to overpraise of the Royal Northwest Mounted Police or any other body of men. I realize that they have their faults and failings. In addition they sent in a large field force. That field force cost Canada $721,737. That was merely the result of the foresight of the Dominion government in taking such measures as would ensure the retention of the Yukon territory to the Dominion of Canada. In the public accounts the cost is included as a charge against the Yukon territory.

When one comes to ask for some vote for the Yukon, member after member will get up and say that the Yukon has been a loss to Canada instead of a profit, illustrating the unfairness of charging these extraordinary expenditures to that territory. In addition to that we are charged, not only with the original capital cost of the telegraph, but with the whole annual cost. I find that $600,000 of the cost was for the portion of the

line in the province of British Columbia. Last year the expenses of operating that line were, in the Yukon territory, $62,000, and the total cost of operating it in British Columbia was $158,000. Although our cost was only $62,000 we are charged with $227,000. The total cost of constructing the telegraph line was something over $700,000; the cost of the portion in British Columbia was $600,000. That should be deducted. The cost of operating that line since its initiation in 1901 up to the present time has been $1,070,000, of which $500,000 has been expended in the Yukon, and has been charged against the Yukon. The way this occurs in regard to the telegraph is that originally it was treated as the Yukon system, and ever since all the expense incurred in British Columbia or anywhere else in connection with the Yukon telegraph system has been charged to the Yukon territory. I think the account should undergo revision in order to bring into it only those items which are legitimately and properly chargeable against the Yukon. I find in addition that $283,000 of the amount paid as damages to Mackenzie and Mann is charged to the Yukon territory. I do not think it is fair to take that amount into consideration in estimating whether the Yukon has been a source of loss or profit to the Dominion of Canada. By including these various amounts the hon. member for North Toronto showed that the deficit of the Yukon amounted to $2,300,000. I think if that account were corrected in the way I have indicated and in the way that, I submit to the Finance Minister and this House, is the proper and legitimate way to correct it, it will be found that the Yukon has a surplus of over $3,500,000. In addition to that I wish to point out that it is utterly impossible to take the Yukon territory, or any other section of Canada, and make out from the public accounts the cost or benefit to the country of that particular section accurately and properly. The hon. member for North Toronto was surprised that while in 1900 and 1901 we had a surplus we had later used that up.

The government of this country adopted with the concurrence, with the express approval of the members of this House, a mistaken policy in the first place in respect to the Yukon territory which was only corrected about 1901. It is the same policy as is being adopted to-day in the province of Ontario and, without any reflection on the motives for the enforcement of that policy, I repeat that it is a mistaken one. It is based on the idea that the rest of the country can take a large mining district and make money out of it for the other public services of the country. That is not right, it is not the right policy with regard to any large mining territory to impose any taxes in addition to those which are imposed on the whole country and to expect that the rest of the country and not that particular territory will get the benefit of the special taxes so imposed. I think that a very few years will demonstrate the lack of wisdom, for instance, of the province of Ontario, in thinking they can take such a large royalty from the mining production of Cobalt and these other regions, and that the rest of Ontario outside those regions can derive any advantage from that royalty. *Ontario will find a little later, when she has had more experience, that while it may be wise and proper to impose some measure of royalty upon the minerals produced in that district, it is absolutely essential that the income thus derived should be expended exclusively for the benefit of the district from which it came.* Down to 1901, the idea of this Parliament and the idea generally prevailing was that these enormous sums of money that were coming out of the Yukon territory should, some of them, find their way into the exchequer of Canada for the benefit of the rest of Canada, and as I say it was not until 1901 that this government realized, and adopted a policy founded on that realization, that the only sane and proper use to make of the royalty got from the Yukon territory was to devote it to local uses in the Yukon. Previous to that time we had no public building, the telegraph line was not constructed, we had no roads which are the absolutely essential needs of that country, and whatever large expenditure there was after 1900 was due to the fact that the government, as I think, realized that the royalty which they had received from that territory ought to be devoted to the development of that country. They adopted that policy and expended for these objects the surpluses which they had previously piled up and the surplus of that year.

There are several causes which account for the reduction in the revenue from the Yukon since that time. In the first place, the royalty in the Yukon territory was ten per cent., which was subsequently reduced to five per cent. and later to two and a half. Necessarily the year in which the royalty was reduced from ten per cent. to five per cent. showed a decrease in the revenue, and this decrease was still greater when the royalty was reduced to two and a half per cent. Then, in the beginning of the Yukon, the people of Canada made a greater mistake than any mistake which the government made. They were not very familiar with mining localities and made the great mistake of imagining that anything was good enough for a mining camp, whereas any one who knows anything about mining camps knows that nothing is too good for them. The miners have the money and will pay for good articles, especially if they are far away from commercial centres, because the cost of transportation is so great that they have adopted the wise policy of buying the very best. For instance, some Canadian manufacturers or merchants sent into the Yukon butter not fit for axle grease, and it took four or five years to get over the bad impression created in the Yukon by that horrible butter; only in recent years would people in that country eat Canadian butter, which they now find as good as any produced in the world. That is one matter in which the farmers, or whoever were responsible for the export of butter, made a mistake. Another matter in which the Canadian manufacturers erred was in respect to boilers. I have seen the streets of Dawson for half a mile piled up with small boilers and hoisting machinery. I came to manufacturers in the east, and I know others who came, and asked them to meet that requirement of the Yukon and manufacture suitable boilers. Their answer was that their business was booming so rapidly that they could not undertake that business. One said that his business in the previous year had been so increased that he was obliged to double his capacity, and if he attempted to fill the demand of the Yukon he would be obliged to still further increase his power of production, and as a consequence he did not attempt to supply that market, and I venture to say that not one-half of one-quarter per cent. of the hoisting machinery that went into that country came from Canada; it all came from the United States. The people of the Yukon are quite willing to buy in this country and made endeavours to buy here, but when Canada would not furnish the articles demanded, they were obliged to turn elsewhere.

Another cause of reduction in the revenue from the Yukon is the change of the customs, and if I may express my opinion on the subject I hope that the Ministers of Finance and Customs will recommend a further change, because I think there is no policy which can be wiser for Canada to pursue than the policy of making absolutely free those articles of machinery, those articles of necessity which go into a new country and are absolutely essential to build up its industries. Take the conditions in the Yukon. A mining proposition is of necessity always hazardous, and I maintain that as little taxation as possible should be imposed until the venture has been absolutely set afoot and has been proved to be a profitable one. By imposing large taxation at the beginning, you are crippling and perhaps rendering impossible an industry. Take for instance an industry that proposes to install a large power plant to work mining machinery. It requires, in the first place, a large sum of money for installation. It is told that there is a heavy tariff on all machinery which it is required to import. That, of course, gives a little black eye to the scheme of promotion and then the promoters are obliged to pay a duty on that machinery at a time when their industry has not produced anything and is not in a position to produce anything, and when the promoters are not absolutely certain it will not be a failure. In one respect a royalty is the best of all taxes on a mining territory, because a man is only asked to pay when he has the money in his pocket to pay. *A tariff on mining machinery is the worst form of taxation, because it is a tax at the very initiation of an industry, which may and does stop thousands of developments that otherwise would take place.*

Another cause of reduction in revenue in the Yukon is due to the increased proportion of Canadian manufactured products used in that country. In the earlier days the major part of the importations into the Yukon was of American origin. I shall not weary the House with figures, but, for instance, in 1899 the domestic importations into the Yukon amounted to only 9,800 odd tons. By St. Michael's there were imported 3,334 tons and via Whitehorse, 6,510 tons—a total of 9,844. Of foreign importations via St. Michael's there were 12,000 tons, and via Whitehorse, 2,700 tons, making a total of foreign importations of 15,000 tons against 9,800 tons of domestic importations, the total importations at that time being 24,856. Every effort was made by the Department of Customs and by every one in that country who had any authority to direct the trade of the Yukon territory into Canadian channels, and this effort was successful to the extent that in 1906 the domestic importations into the Yukon were 14,309, and the foreign 10,698, so that you have about the same gross importations, but the proportions of Canadian and foreign goods are reversed between 1899 and 1906. The change in the source of the goods imported into the Yukon necessarily caused a falling off in the customs revenue from that territory, even although some of those goods that appear as domestic may be foreign. Of course that accounts for the falling off in the revenue of the Yukon territory even though some of those that appear as domestic may be foreign. But let me give one instance to show how difficult it is to get at the exact revenue which the national treasury receives from any particular portion of Canadian territory. There is being installed about 40 or 50 miles below Dawson a large power plant which will distribute that power to Dawson and its vicinity, which is absolutely essential for mining purposes. The company promoting that power plant was unable to make arrangements for the transportation of its machinery with the railway company that runs into the Yukon territory, and which I may say is the most horrible incubus that any country has ever laboured under. The power company was compelled to land its machinery at Vancouver, so that the province of British Columbia gets the credit for the revenue of $58,000 from the duty on that machinery, which will eventually go to the Yukon. Of course it makes no difference so far as the revenue of the country as a whole is concerned, but if the Minister of Customs can find any way to credit that amount to the Yukon territory rather than to the province of British Columbia, I suggest that he should adopt it. That, however, is only one instance, and there are very many others of a similar kind which go to prove the suggestion with which I began, that it is impossible to show the revenue derived from any one section of the Dominion. For example, I am informed that the customs revenue paid in the city of Montreal is one-third of the whole customs revenue of the Dominion of Canada, and while Montreal is a great city in a great province, yet there is no doubt that a very large part of the revenue paid there should be credited to other provinces in which the consumers who use the goods are located. In the same way, British Columbia gets credit for some of the revenue which should rightly be credited to the Yukon territory.

Now, there is one other thing which I wish to say with regard to the Yukon territory before concluding my remarks, and that is I think the government has adopted a correct policy in reducing to the very lowest possible amount the expenditure on the official administration of that territory. At one time undoubtedly the whole official staff employed in the Yukon was needed, and it is not an easy thing to determine the exact moment when a change in conditions renders it no longer necessary to retain the whole staff previously existing. However, I think that now the time has arrived when the official staff in the Yukon territory should be reduced, and I say that out of no spite or malice against any of the officials. I believe it has been intimated that I secured the dismissal of some of them for political reasons. Indeed, it has been stated in a despatch to the public press that they had incurred my displeasure because they refused to give $50 each as a contribution to a political campaign fund. Although some newspapers have published that despatch I notice that when these gentlemen were interviewed in Vancouver they made no such statement as that credited to them. At all events, I invite any hon. member of this House who wishes to investigate the charge, or, better still, he can go to any one of these officials and I think he will find they will deny that they ever made such a statement. I might add that I never made a request from them or from any man in my life for a contribution to my own or to any other campaign fund, and any one who knows me knows that I am one of the worst collectors that ever appeared in any country; I cannot collect even my own debts, not to speak of collecting campaign funds. I may point out also that not one of the gentlemen who have been dismissed in the Yukon territory has had his place supplied by another official. He was dismissed simply for the purpose of economizing, and so far as my having any malice against them I have been eager to induce the government to adopt a system by which when it becomes necessary to get rid of an official in the Yukon he shall not be set adrift like an old horse but that he shall

be transferred to some other branch of the service of the government, corresponding perhaps to the service he was in in the Yukon territory. I hope the members of the government will endeavour to carry out that idea, so that these officials may be transferred from places where they are not needed to offices where their services will be of benefit to the country. I am particularly desirous of reducing the expenses of administration in the Yukon in order that there may be a larger amount available for developing the resources of that rich country. I could spend hours, Mr. Speaker, dilating on the possibilities of the Canadian Yukon. There are, I know, some who imagine that its days of prosperity have passed, but I can assure them that the beginning of the development of the Yukon has not yet come. I am supported in this belief by those who know the territory best and who declare that the output from placer gold mining will increase year by year for many years to come. Apart from the placer yield of the country there are the most wonderful deposits of quartz that the world ever saw. You cannot turn in any direction without finding quartz leads, quartz ledges, and stringers, which were it not for the excessive cost of transportation would be developed at once. We have scores and scores of mines which were they situated at an accessible place would to-day be developed and yielding fortunes. There are, however, mines at the threshold of the territory at St. Michaels which are being developed. No enormous amount has been expended upon them because in the development of a large mine half a million dollars is inconsiderable, but they will no doubt greatly add to the mineral wealth of that territory. Then you pass to Whitehorse and you have a crescent twenty-five miles in extent on which you can scarcely go 100 yards without finding an outcrop of copper of the highest grade. Recently on the dome they have struck at one place on the 50-foot level, and at another place at the 100-foot level, indications of the best paying quartz. Last summer on the Mackenzie River side, the prospectors returned with specimens of some of the richest quartz ever known. Of course I do not know whether it will turn out as anticipated, but at all events the existence of these minerals in every quarter shows that the mining industry in the Yukon territory is practically only in the same initial stage that it is in British Columbia and in Ontario. I do not think it would be rash to say that within twenty-five years Canada will exceed any country in the world in its mineral production. Then experience has taught us, as in the case of the northern regions, and Cobalt, and Gowganda, that the best thing to promote settlement in a territory is mineral discovery, because the minerals will not only yield wealth themselves but they will bring in population which will remain there to develop agriculture and other natural resources. The subject is perhaps more entertaining to me than it is to the members of the House, and I must apologize for detaining hon. gentlemen at such length, but at all events I feel confident that the Yukon territory deserves the encouragement of the government and of the country in the development of its extraordinarily rich resources.

NOVA SCOTIA'S MINERAL OUTPUT IN 1908.

By Arthur S. Barnstead.

The total value of the products of Nova Scotia in manufactured goods, agriculture and horticulture, mining, fishing and lumbering, has been estimated for 1909 to be $114,400,000. Of this total the mining industry contributes a value of about $15,550,000, approximately about 12½ per cent. of the total. The development of the mines forms the basis of many of the manufacturing industries of the province so that Nova Scotia mineral wealth may be placed at a very much higher value than the figures given above. The contiguity of coal mines to such centres as Amherst, New Glasgow and Sydney has had very much to do with the development of these towns as industrial centres. It is difficult, however, to estimate the actual value that the mineral wealth means to Nova Scotian communities.

Another very important factor in connection with our mineral wealth is that it affords, by way of royalty, about 50% of the total revenues of the province. Depression in trade or any disturbance that affects the coal industry has a very serious result in diminishing the revenues at the disposal of the provincial government. This in turn prevents the necessary expansion that other industries of the province require.

During the past year a very unfortunate strike among the employees of certain of the coal mines of the province has interfered very seriously with coal mining. It will be seen, however, that the employee who has been striking and the employer are not the only parties in this test for supremacy. There is a third party in the manufacturing interests of the province and consumers in general; there is a fourth party, the State, all of whom suffer alike as a result of a diminished output.

At the beginning of 1909 the clouds of controversy hung heavy over our mining industry, the legal battle between the conflicting interests of the Dominion Iron and Steel Co., and the Dominion Coal Co., had not been decided. There was an incursion by the American coal operators into the St. Lawrence markets, which had been heretofore controlled by the Nova Scotia mine operators. A third serious difficulty arose out of a possible conflict between clashing interests in view of the determination of the United Mine Workers of America to gain a foothold among the workmen of the province. The two latter difficulties have been grouped together to a very large extent, invasion it is claimed being connected with and succeeding because of the partial tying up of our collieries.

The first cloud of controversy between the Dominion Iron and Steel Co., and the Dominion Coal Co., has happily cleared. The decision of the Privy Council was given early in the year, and in the spring the shareholders and directors of the warring companies agreed to sink their differences and link their interests. This propitious ending has been only recently brought about and both the Dominion Iron and Steel Co., and the Dominion Coal Co., are now practically one and

the same company. The amalgamation will mean much for the steady development of the steel industry because the company will be assured of a continuous supply of coal. On the other hand the coal company will have an assured market for certain grades of coal and there will be no disturbance about prices.

The second and third of the difficulties grew greater and more ominous as the months succeeded one another. The coal operators have had their St. Lawrence market very seriously interfered with by the United States operators who have dumped their coal into Canada because of the depression in the United States and because they are able to mine their product at a much cheaper rate. The strike operations have been for the most part directed against three companies in the province: the Dominion Coal Company, Cape Breton; the Cumberland Railway and Coal Co., at Springhill, and the Inverness Railway and Coal Co. at Inverness. So strongly organized were the United Mine Workers of America at Springhill that as soon as the strike was declared the management felt themselves under the necessity of closing down the mine and doing only such work as was necessary to comply with the law for keeping the mine in a good and safe condition. Since the first of August no coal has been mined at Springhill.

At Inverness the strikers were not so successful. After a short struggle the company was able to do without the services of the strikers and has mined nearly as much coal as in the previous year.

The main strength of the United Mine Workers was directed against the Dominion Coal Co. at its several collieries in Cape Breton. There the battle has been tense and long drawn out. The loyalty of the Provincial Workmen's Association has enabled the management to utilize these men in mining, to import others to take the place of the strikers and so to maintain a working output at most of the collieries. At the moment of writing the strike is still in active force at these centres though rumours are current that it has spent its strength.

Comparing the output for the province with that for 1908 there is a decrease of about 830,000 tons. This has been a serious loss to the miners as well as to the companies and the province. The Dominion Coal Company's output has been diminished by 1,031,640 tons. A few of the other companies who were not affected by the strike operations have as a result increased their output, so that the total provincial loss is not the combined loss of the three companies against which the strikers have contended for recognition.

The Dominion Coal Co. raised 2,785,318 tons of coal during the year, selling of this 2,576,004 tons. Though hampered by the continuance of the strike this company has carried forward its plans for the opening up of collieries on the Lingan and Victoria seams. As a result the new town of Waterford has emerged from the Cape Breton forests in the Lingan district. Its site has been laid out, streets plotted out, sewerage and water supply provided and everything arranged before dwellings are erected to accommodate the expected influx of population. Altogether two million five hundred thousand dollars will be expended in making this an up-to-date colliery town before operations are begun. Waterford is now a village of 300 or 400 inhabitants, but in a short time its population will be up in the thousands.

The Nova Scotia Steel and Coal Company, operating at Sydney Mines, has increased its output by 67,500 tons in excess of the production for the previous financial year ended September 30th, 1908. This company presents the best record that any coal company in the province can show for the past year. It has also continued to make satisfactory progress in plans for further expansion. The Nova Scotia Steel and Coal Company has had no labour difficulties in the past forty years, a record that few companies can present, but that many would welcome most heartily. A mine, abandoned by the General Mining Association a long time ago, was put into active operation during 1909, and is now sending up 500 tons of coal per day, with a prospect of continuous increase.

The North Atlantic Collieries Company at Port Morien has increased its output to 73,582 tons. During the past two years this company has continued its extensive submarine development and has come into prominence as a producer.

The MacKay Mining Company opened a new mine, from which it raised 13,587 tons. This company and that of the Sydney Coal Company operate their collieries at North Sydney. The latter company mined 4,733 tons. The Colonial Mining Co. entered the field the last month of the year, mining 633 tons.

About 40,000 tons less coal was mined in Inverness County than in the previous year; this is divided among the different coal companies as follows:—

Inverness Railway and Coal	19,000
Port Hood Coal Company	3,500
Mabou Coal Company	17,500

Though the strike did not affect the mining operations in Pictou County, yet there has been a decrease in the coal mined by approximately 100,000 tons. In Cumberland County there have been 17,000 tons less mined than in the previous year. The decrease in the output of the Cumberland Railway and Coal Company's mines amounts to 40,000 tons. On the other hand, the Maritime Railway, Power and Coal Company has increased its output by 33,000 tons, and the Eastern Coal Company at Maccan has produced 4,411 tons. The last-mentioned is a new producer. The other companies maintained their previous outputs, excepting the Strathcona Coal Co., which shows an output of 17,000 tons less than the previous year. The effect of the strike will be more apparent in the current year than in the year ended September 30th last, as the strike had been in force in the Springhill mines for only two months. As will be noticed, marked development has taken place both in Chignecto and the Joggins, and also at the collieries of the Maritime Railway, Power and Coal Company.

The following table giving the amount of coal raised during the twelve months ended September 30th, 1908, and September 30th, 1909, will show the different productions for the two years and the general effect of the strike and conditions of trade:—

Cape Breton—	1908.	1909.
Dominion Coal	3,816,958	2,785,318
Nova Scotia Steel and Coal	662,350	757,539
North Atlantic Collieries	58,777	72,582
McKay Mining	13,560	13,587
Sydney Coal	4,801	4,733
Colonial Mining	.....	633
	4,556,446	3,634,392
Inverness—		
Inverness Railway and Coal	283,705	264,773
Port Hood Railway and Coal	99,700	96,133
Mabou Coal	19,250	1,610
	402,635	362,516

Pictou—		
Acadia Coal	413,782	364,993
Intercolonial Coal	315,590	292,479
N. S. Steel and Coal	47,845	20,165
	777,217	677,637
Cumberland—		
Cumberland Railway and Coal.	416,132	376,283
Maritime Ry., Power and Coal.	66,963	100,011

Stratheona Coal	23,928	7,086
Great Northern	2,726	3,814
Atlantic Grindstone	861	644
Eastern Coal Company	.....	4,411
	559,013	542,040
Colchester—		
Debert Coal Company	3,951	1,330
	6,299,282	5,217,915

Gold.

About 25 gold mines were in operation during the year, employing 550 men. The total yield has been 12,600 oz., which is an increase of 600 oz. over the previous year. While comparatively little gold was mined during 1909, yet, facing the new year, it may fairly be stated that the work of installation and development carried on during the past year on gold mining properties will ensure a very much larger output during 1910.

The New England Mining Company crushed 44,375 tons of quartz at Goldboro, producing a yield of 5,027 oz. of gold. This is the one-time Boston-Richardson Company. The Oldham Sterling Gold Mining Co. at Oldham produced 2,710 oz. from 942 tons of quartz, showing a yield of 2.88 oz. per ton crushed. The Great Bras d'Or Company at Middle River recovered 708 oz. out of 783 tons crushed. The Sydney Gold Mining Company, at Country Harbour, Guysboro County, obtained 450 oz. out of a crushing of 510 tons. From these four companies about three-quarters of the yield has been received, the remaining 3,600 oz. have been obtained from the Ponhook Gold Mining Company at Malaga Barrens, the Eagle Mining Company at Renfrew, the Caribou Gold Company at Oldham, the Moose River Mining Company, the Consolidated Mines of Canada, Ltd., the Chester Basin Gold Syndicate, the Eagle Mining Syndicate at Salmon River, the Ophir at Brookfield and the Petpeswick at Lake Catcha. Other companies have either not secured any production or have worked on a very small scale. The Dominion Mining Company at Tangier has installed a hydro-electric plant generating 4 to 800 h.p., securing its power from Tangier River. It would seem that in gold mining the water powers of the province could be used to much greater advantage than they have been in the past.

Iron and Steel.

The total production of iron ore in the province during 1909 was 12,000 tons. The Dominion Iron and Steel and the Nova Scotia Steel Company, the two largest workers of iron ore, imported together about 656,000 tons from their mines at Wabana, Newfoundland. This accounts for the lack of development in Nova Scotia's rich iron ore beds.

The total production of the Dominion Iron and Steel Company in pig iron has been 255,912 gross tons (2,240 lbs. each) and 409,469 tons (2,000 lbs. each) of coke. This company has also produced 297,330 gross tons of steel ingots, from which were manufactured 140,091 tons of rails, 73,047 tons of wire rods, and 25,470 tons of merchant blooms. They have recovered in by-products 3,031 gross tons of sulphate of ammonia and 4,020,000 gallons of tar.

The Nova Scotia Steel and Coal Company has manufactured 51,408 tons (2,240 lbs. each) of pig iron, and has produced 88,237 net tons (2,000 lbs. each) of coke. It has also made over 63,000 tons of steel ingots, 54,000 tons of blooms and billets cogged, while it has shipped 53,000 tons of finished material, bars; plates and forgings from the New Glasgow plant. 70,000 tons of limestone and dolemite have been quarried for its operations.

Other Minerals.

The export of gypsum has increased by 50,000 tons, the total this past year amounting to 280,000 tons. Together with the amount that must be mined and used by farmers throughout the province, there must have been fully 325,000 tons of gypsum produced during 1909. 23,000,000 bricks have been manufactured from the clay, and a large number of men find employment in an establishment in New Glasgow, where the clay is manufactured into pipe for tile draining.

Owing to the increased use of cement, of which 50,000 barrels of slag cement were manufactured in Sydney, less building stones were quarried than in the previous years. 25,000 tons less of Wallace stone were taken from the quarries than in the previous year. Limestone is used in great abundance by the iron and steel industries; about 240,000 tons were quarried at Marble Mountain, Cape Breton, for the Dominion Iron and Steel Company. Further prospecting has taken place in connection with the important discovery of tungsten at Moose River, Halifax County. About 4,000 tons have been uncovered. This is about equal to the present production of the world for a year. The tungsten is found in the form of scheelite, which assays about 60 per cent., and is consequently a valuable discovery.

REPORT OF THE COUNCIL OF THE CANADIAN MINING INSTITUTE FOR THE YEAR 1909.

The Council, in presenting a report of the work of the Institute for the past year, is gratified to be able to state that the affairs of the society are now in a more flourishing condition than at any previous time in its history. Not only has there been a steady increase in membership, but greater interest is being evinced by members in the work of the Institute than ever before. The financial position of the Institute is also a sound one, and this is the more satisfactory since the expenses of publication, by reason of the considerable increase of volume of printed matter distributed to members have now become a very heavy annual charge. In this connection attention may, perhaps, be called to the fact that Volume VII. of the Transactions, for the year 1909, comprises rather over seven hundred pages; or, in other words, the Institute is at present publishing a volume of twice the size of that of four years ago, and it should be a matter of some pride to members that, in point of value and interest, the Institute's Transactions to-day compare most favourably with those of any mining society in the world. In remarking on this point, thanks and acknowledgments are specially due to those eminent gentlemen (many of whom are members of the United States Geological Survey), who in recent years

have attended the Institute's Annual Meeting, and have so generously contributed material of exceptional merit and value to the proceedings.

Referring to other activities of the year, the Institute has reason to congratulate itself on the repeal of the Quebec Mining Law of 1892 and of the substitution therefor of regulations decidedly more conducive to the encouragement of legitimate prospecting and mining in this province. This very welcome change is largely traceable to the Institute's influence and representations.

At the annual meeting in March, 1909 a resolution was adopted in which the attention of the Dominion authorities was directed to the urgent present necessity of introducing and placing on the statutes a Mining Act wherein proper regulations would be provided governing the acquisition, development and operation of mining lands under Federal control. That such a mining law might be of a nature to encourage rather than retard industry, it was further suggested that before framing such an act, the views of the mining community be ascertained thereon by the appointment of a Royal Commission to secure evidence. No action was taken by the Government in respect of this latter suggestion for the reason that Parliament had just previously appointed a Standing Committee on Mines and Mining, whose duties partook largely of those of a commission; but this committee immediately entered into communication with the Institute, inviting its cooperation and assistance. In consequence, four gentlemen, namely, Dr. A. E. Barlow, Mr. J. M. Clark, K.C., Mr. B. A C. Craig and Mr. J. B. Tyrrell, having special knowledge of the abuses incidental to the present Dominion system of regulating the granting of titles to mineral land, were requested by the Council to act as the Institute's representatives, and appear before the Parliamentary Committee as witnesses. They did so, representing to the committee that since all matters relating to mining on Dominion lands had been heretofore regulated by Orders in Council, stability of conditions was not ensured, and instances were quoted in proof of the contention. The witnesses also advocated the principle of discriminating between surface and mining rights in the granting of titles to public lands, and urged that all business relating to mines and mining be transferred, and be in future conducted by the Department of Mines, pointing out in this connection that although the Department of Mines had now been established for over two years, it was still requisite that applications for mining areas should be made to the Department of the Interior, which Department also was entrusted with the issuing of grants and patents.

The Parliamentary Committee, since this evidence was given, has issued a report recommending (1) that there be assigned to the Mines Department the administration of mines, including the issue of title thereto, and of all mining laws: (2) that an act be passed consolidating all the laws relating to mines under Federal control; and (3) that consideration be given to a policy which will have for its object the re-acquisition by the Crown of mining rights heretofore granted in patents of land.

In view of report, the Council hopes that the recommendations of the Institute, in respect of the introduction of favourable Dominion Mining Legislation, will, in the near future, be carried into effect, and advantage is taken of the present opportunity to congratulate the Parliamentary Committee on its useful labours in the interest of the mining industry.

Meetings.

The eleventh annual meeting of the Institute was held at the Windsor Hotel in the city of Montreal, on March 3rd, 4th and 5th, 1909. The attendance was exceptionally large, there being over two hundred members and others present. The occasion was also notable in that the Institute was honoured by the presence of several eminent gentlemen from the United States, including Mr. S. F. Emmons and Mr. Waldemar Lindegin, of the U. S. Geological Survey; Dr. A. C. Lane, State Geologist of Michigan; Dr. J. F. Kemp, of Columbia University, New York, and Dr. H. Ries, of Ithaca, New York, who presented addresses or papers of great value, and otherwise materially contributed to the success and interest of the meeting. The Institute was also privileged to entertain at its annual dinner His Excellency the Governor-General, who delivered a most interesting address; the Hon. Wm. Templeman, Minister of Mines for the Dominion, the Hon. Frank Cochrane, Minister of Mines of Ontario, and other eminent Canadian Parliamentarians.

Other meetings held during the year have included those at Rossland, Nelson and Spokane, under the auspices of the Western Branch, and branch meetings at Cobalt and Montreal.

Five regular meetings of Council have been held at headquarters, whilst a special meeting was held in Toronto in the month of July.

Publications.

The papers presented at the annual meeting, together with those read at the branch meetings, and also others transmitted direct to the Secretary, in all 41 papers contributed by members, associates and student members, together with the discussions thereon, have been published in Volume XII. of the Journal of the Institute, copies of which have been distributed to members in good standing.

There have also been published and distributed during the year four bulletins, in which have been printed papers "subject to revision," notices and other matters of interest to the general membership.

Branches.

Both the Cobalt and Western Branch have been very active during the year, and show substantial membership gains. In addition to holding two well-attended meetings in British Columbia, the Western Branch accepted an invitation to participate in a joint meeting in Spokane with the American Institute of Mining Engineers in September last, whilst under the leadership of the president of the Institute the Cobalt Branch acted as host to a party representing the geological section of the British Association, who had been invited to visit the mines of this district. The party, accompanied by representatives of the Institute, subsequently visited Temagami, Sudbury, Moose Mountain, Copper Cliff and Silver Islet, and after attending the general meeting of the association in Winnipeg, continued the journey across the continent to Vancouver.

Library and Reading Room.

The present location of the Institute's office in the Windsor Hotel, Montreal, has proved a very great convenience to members visiting headquarters, who have availed themselves freely of the facilities afforded them to consult the library, or make use of the reading room. Many visitors from abroad and foreigners desirous of obtaining information anent Canadian mines and mining have also called at the offices to seek the secretary's

assistance or advice, and it is believed that the possibilities of rendering valuable and useful service in this direction are considerable, more especially when the fact that the Institute is prepared to supply information to those requiring it becomes more generally known. In order to advertise its readiness in this respect in Great Britain, the High Commissioner's Office in London has been notified that the Institute is prepared to receive and reply to any enquiries on the subject of Canadian mining.

Little or no expenditures have been made this year on library account, but numerous donations of books have been received, particulars of which have been published in the Institute's bulletins.

Secretary's Office.

The following returns are taken from the secretary's records for the ten months ending December 31st, 1909:—

Letters received	2,274
Letters written, etc.	6,395
Circulars issued	7,400
Publications issued	6,200

Students' Competition and Awards.

In 1909 ten papers were submitted by student members in competition for the Institute's annual awards. After receiving the report of the judges, namely, Dr. H. Ries, of Cornell University, Ithaca, N.Y.; Mr. Arthur A. Cole, of Cobalt, Ont., and the secretary, who acted in an ex-officio capacity, the Council has awarded the president's gold medal to Mr. N. L. Bowen, of the School of Mining, Kingston. In addition, Mr. Bowen received a cash prize of $25, while cash prizes of $25 and $20 respectively were awarded to Mr. E. P. Cowles, of McGill University, and Mr. G. J. Burland, of McGill University. The papers submitted by Messrs. King, Rider, Rutherford and White received honourable mention.

Frecheville-Commans-Mariotti Competition.

Three of the gentlemen, namely, Messrs. R. E. Commans, Wm. Frecheville and Hugh F. Mariotti, who participated in the Institute's summer excursion of 1908, as representatives of the Institution of Mining and Metallurgy, desiring to give definite expression of their appreciation of the hospitality they received on that occasion, early last year, communicated with the Council, requesting permission to donate the sum of fifty guineas as a prize to be offered for the best paper contributed by a junior member (namely, one under thirty years of age) to the Institute's Transactions before January 1st, 1910, on a subject descriptive of any mining or metallurgical improvements effected in Canada during the year from October 1st, 1908. The offer having been gratefully accepted, the Council appointed three of its members, Messrs. J. Bonsall Porter, J. C. Gwillim and H. E. T. Haultain, a committee to direct the competition and to see that the conditions were properly complied with. Under instruction from the committee, a circular, in which particulars of and conditions governing the competition, was duly issued to members in April last. In response to this circular, five papers have been forwarded to the secretary for submission to the committee, and it is hoped that the judging will be completed in time for the results to be announced at the annual meeting.

Membership.

The membership of the Institute, inclusive of all classes, now totals nine hundred and thirty-six (936). The accessions during 1909 were as follows:—

Corresponding members	2
Ex-officio members	1
Members	70
Associates	20
Students	4

It may be here noted that the mining students of the "Ecole Polytechnique," Montreal, have recently organized a Mining Society, and have applied for affiliation with the Institute. The present membership of this society is 25.

With a view to establishing and promoting friendly relationship between the Institute and the Institution of Mining and Metallurgy, the Council in July last submitted a proposal to the Council of the latter organization, offering to provide in future that members of the Institution of M. & M. non-resident in Canada should be admitted to membership of the Institute upon payment of a reduced annual subscription of $5. This offer having been accepted, a by-law in accordance therewith has been prepared for submission to and for the consideration of the annual meeting.

Deaths.

The Council records with profound regret the deaths during the year of the following members:—

Members—Fraleck, E. L., Member of Council; Colville, Andrew; Fletcher, Hugh; Fowler, L. A.

Associates—Ferguson, John; Graham, Harvey D.

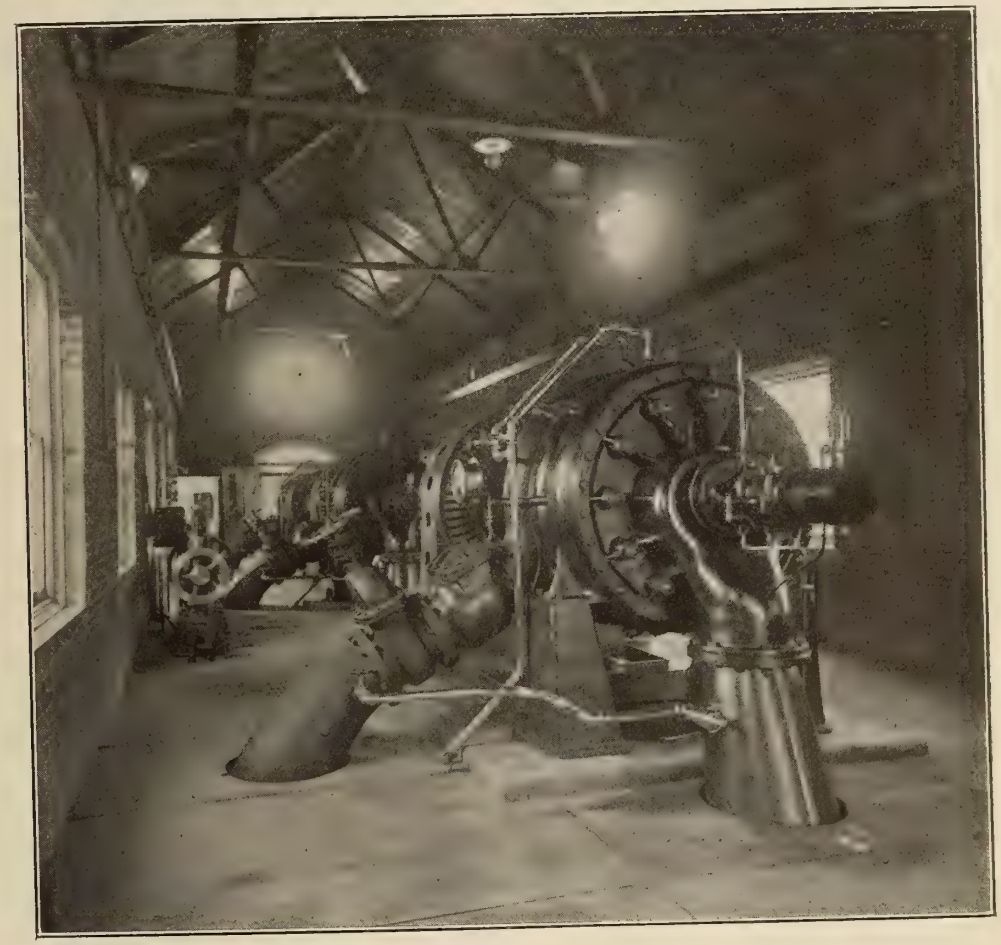
The following gentlemen have resigned their membership:—

Members—Auzias-Turenne, R.; Brainard, Dwight; Corbett, Geo. E.; Dickson, Dr. C. W.; Hayward, A. A.; Hidden, Wm. Earl; Hillis, J. T.; Hungerford, W. A.; Leach, Norman L.; MacLean, John S.

Associates—Allen, K. C.; Gaskin, R. G.; Hall, F. Asa; Horne, J. T.; Monk, Ed. W.; Naismith, Arthur P.

H. MORTIMER-LAMB, Secretary.

ACCIDENT AT GOODWIN LAKE MINE, TWP. OF LORRAIN, JAN. 15, 1910, WHEREBY FRANK SHEPHERD WAS KILLED.



The accident occurred in a 90-foot shaft being operated by the Goodwin Lake Mining Company. Frank Shepherd and Leo Doyle were employed in shooting a round of four holes in the bottom of the shaft. The blasting signal was rung, and as soon as it was answered by the engineer, Doyle spit the four holes and he and Shepherd climbed on the bucket and rang the hoisting signal. As the bucket started, Shepherd fell and caught the edge of the bucket with his hands. He hung on until the bucket was up 60 feet, when he had the bucket stopped, but in trying to get a better hold he slipped and fell to the bottom. After Doyle reached the surface the bucket was sent to the bottom, but Shepherd was apparently unconscious from the fall. The four blasts went off shortly after, cutting Shepherd up in a horrible manner.

After an inquest was held, information was laid by Mr. E. T. Corkill, Inspector of Mines, before Magistrate Atkinson against the Goodwin Lake Mining Company and Contractors McDonald & Kenty, for a violation of Sections 164, 23 (a) of the Mining Act of Ontario, which calls for a suitable ladder to be always in the shaft to provide an auxiliary means of escape. Had this ladder been in position, as called for by the act, the deceased would have had an opportunity of dropping from the bucket when he first slipped and of climbing up the ladder. Both the contractors and the company, if proved guilty, are liable to a fine of not less than $100 nor more than $1,000.

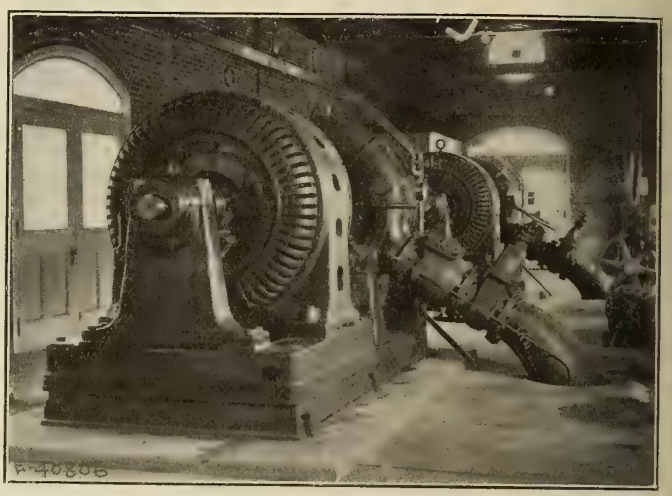
THE ELECTRICALLY DRIVEN PUMPS OF LOCKPORT, N. Y.

The city of Lockport, N.Y., derives its water supply from the Niagara River, near North Tonawanda, thirteen miles away. From the electrically-driven pumping station at this point, the water is forced through 69,000 feet of 30-inch main to a stand pipe 25 feet in diameter and 120 feet high, at Lockport.

The pumping plant contains three independent units with a combined capacity of delivering 15,000,000 gallons in 24 hours against a pressure of 125 pounds. Each unit comprises a Westinghouse induction motor, designed for 500 horse power at 750 revolutions per minute, with three-phase current at 400 volts, direct connected to a single suction, enclosed impeller centrifugal pump made by the Holly Manufacturing Company, Buffalo.

Power generated at Niagara Falls is transmitted to North Tonawanda at 22,000 volts and is stepped down to 440 volts at the pumping station by three 500 kilowatt, oil insulated, water cooled transformers.

The three motor-driven pumping units were recently given a very complete test, which developed some interesting economies of electric operation. Each unit was run continuously for 15 hours, during which time readings of the electrical input were taken every five minutes; readings of the Venturi water meter every ten minutes; pressure gauge every five minutes, and revolutions of pump every fifteen minutes. The results are given in the accompanying table, which shows that all three of the pumps exceeded the duty requirement of 27,000,000 foot-pounds by approximately 4,000,000 foot pounds. It will be further noted that the temperature rises are well within the specifications, and that the pump capacities and horsepowers are well exceeded:—



Results of Tests of Lockport's Motor-Driven Pumping Units.

	Pump 1.	Pump 2.	Pump 3.
Maximum revolutions per minute	746	752	744
Minimum revolutions per minute	738	738	739
Average revolutions per minute	743	744	744
Maximum gauge pressure, pounds	142.5	144.5	143.5
Minimum gauge pressure, pounds	119.5	139.5	134.5
Average gauge pressure, pounds	136.9	142.6	138.9

Average head, feet	315.8	329.1	320.6
Gallons pumped per hour..	238,000	236,300	236,700
Gallons pumped in 24 hours at this rate	5,712,000	5,672,000	5,712,000
Kilowatt input per hour....	342.4	346.1	341.5
Gallons per kilowatt hour	1,454	1,464	1,443
Hydraulic horsepower	318	327	319.5
Electric horsepower	456.6	456	455
Efficiency per cent.	69.6	71	70
Duty, foot-pounds per 1,000 kw. 30,800,000		31,600,000	31,000,000
Degrees temperature rise in 15 hours	41	38	43

In the case of the Lockport pumping station, electrical energy is purchased at $16.00 per horsepower year. The cost of power for this station is thus just about equal to that of steam operation under conditions assuming cross-compound pumping engines giving a duty of 130,000,000 foot pounds per 1,000 pounds of steam; coal at $3.00 per ton delivered into the boiler room; 8½ lbs. evaporation under working conditions, and including labour for making steam and handling ashes, as well as increased fixed charges against the additional plant for operating with steam. This electrically-driven pumping plant is thus developing duty equal to 130,000,000 foot pounds per 1,000 pounds of steam.

In connection with this plant, which is pumping its output 13 miles to Lockport, it may be of interest to note that last summer when a large fire broke out there eleven powerful fire streams through varying lengths of hose were maintained from the stand-pipe and pumps as long as needed for service.

The entire water supply of which this station forms a part, as well as the station itself, was designed by Mr. Charles A. Hague, consulting engineer, New York City.

SILVER IN 1909.

Messrs. Samuel Montagu & Co., Review the Past Year.

A retrospect of the silver for the year is singularly uninteresting in regard to price. During the first four months the monthly averages of the cash quotation kept within the narrow limit of about five-eights of a penny —23.226 and 23.834—and those of the concluding six months—23.351 and 24.030—show a slightly wider difference. The highest prices of the year were reached in the remaining two months, May and June, the averages for which were 24.342 and 24.166 respectively. The highest quotation of the year was 24⅞d on the 5th May, the lowest 23-1/16d on three dates—namely, 4th March, 26th and 30th October; the net difference between the highest and lowest of the year is therefore 1 13-16d. During seven months the average forward price was slightly above, and during the remainder, slightly below, that for cash. The difference between the two daily prices was rarely large except in the early part of January, when the cash stood for a week or so—3/16d to 5/16d higher than the forward price. Not only does a general view of prices reveal the narrow limits within which the quotation moved, but in certain periods fluctuation ceased entirely, and an absolute record for immobility in recent times was created in August, when the price stood at 23½d for eight successive working days. It is a curious fact that notwithstanding this remarkable rigidity of price the year has been prolific in business, with the turnover unusually large, and at the very time the pointer rested in August at 23½d, transactions were on quite a substantial scale. More or less throughout the year there has been a prolonged contest between India and China; this appears to be the chief reason for the exceptional stability of price. Owing to excessive imports into China in preceding years, merchants were encumbered with goods, and fresh imports were very small until the then existing stocks became absorbed. Meanwhile, the exchange being one-sided, the foreign banks were compelled to import silver, or more frequently to purchase forward silver, so as to adjust the balance of trade, and in consequence the stock of sycee, &c., at Shanghai rose until a record figure of 31,000,000 ozs. was reached on 18th October. At the same time the stock in Bombay amounted to 15,000,000 ozs. and in London 2,000,000 ozs., besides another 4,000,000 ozs. on the sea. Apart from the Cobalt mines of Ontario, there is little need to comment on the world's supply. It is anticipated that the total for 1909 is in the neighbourhood of 25,000,000 ozs. Favourable news continues to come from the mines, and, for the present at any rate, a possible advance on these figures must be taken into account. The ore is so rich that the silver markets of the world would soon be glutted if the veins were as large as those of the ordinary silver mine. But, while the ore is exceptionally rich, the veins are small. How this addition compares with the increase of the world's population is most vital to the future of silver.

The effect of railway development in China is most important. It is probable that the Chinese themselves will endeavour to finance and build most of the future lines, but of each million sterling of capital financed by the West it is estimated that at least two-thirds will be remitted in silver for labour and material on the spot. The awakening of China by the introduction of machinery and the opening up of its hidden resources will re-

sult in vast addition to its internal wealth. To sum up, development, railway facilities, and a cohesive Government in China, though slow in coming, are powerful factors to be taken into account as to the future. It must not be assumed that, even if a gold basis were to be fixed in China, it would seriously affect the need for silver. We have an example in India of such a change. The closing of the free mint for silver did not have that effect, for during the fifteen years preceding the date of the change, 1,056 million rupees were coined, against 1,011 millions in the fifteen subsequent years. Remembering that a very large proportion of the earlier total must have been melted down for jewellery, &c. (the value of the rupee, coined or melted, being about equal at that time, whilst in the later period the operation would involve a loss of, perhaps, 45 per cent.), the slightly lower total loses significance entirely.

In regard to India, there are two factors ever working increasingly for the prosperity of that country, and against the risk of famine. Inasmuch as the natives of India importd about £62,000,000 of silver in the fifteen years since the closing of the mints, over and above the £42,000,000 required for coinage, it is evident that the well-being of the native must have a very direct bearing upon silver itself. The first influence at work is irrigation. In the year 1906-7, as a result of irrigation, a net revenue accrued to the State of nearly £800,000 from an expenditure in previous years of only 5 millions, and an area of 36 million acres was brought into cultivation. Since that date much larger sums have been laid out each year, and the subsequent returns may be expected to increase proportionately. It is stated that, owing to irrigation, the monsoon is becoming of less importance to the wheat crops, and that much now depends on the after rainfall in June. A second influence for good is the extension of railway mileage, by which is afforded a readier market for produce and a speedier means of alleviating the distress caused by local famine.

It would be of extreme interest if the irreducible minimum of silver actually required by wastage and by the increase of population could be ascertained, but data in regard to the quantity used in the industrial arts for jewellery and manufactures is so vague that any approximate estimate is quite impracticable. On the best authority available the loss by wear of silver coin is about 10 per cent. in 43 years. Taking the value at present prices of the world's stock of silver coin at 2,700,000,000 ozs., the wastage amounts to about 6,300,000 ozs. per annum; adding 1 per cent. as the annual increase of population, 27,000,000 ozs. is obtained—thus 33,300,000 ozs. is demanded on the score of coinage alone. A further quantity is called for by the increase of wealth in India and China; both of these countries, especially the latter, place a large portion of their savings in silver. There is a certain increasing demand for silver quite irrespective of price, and fluctuations in the value of silver affect merely a balance, perhaps smaller in proportion than generally suspected. It is not reasonable to suppose that the yearly increase from Ontario will not be so great, for the area involved, though large, is limited in extent, and many mines are now in full working operation. It is fair to assume from the remarkable steadiness of the price during the year, in spite of such addition to the world's supply, that the world's consumption, barring disastrous crops in the East, is likely to keep pace with any reasonable increase from that quarter, and no fall in value need be expected specially from that cause. Some confident anticipation must exist in the minds of Indian operators who have held the large stock of about 12,000 bars throughout the period of the year when money was most dear that the inquiry for silver will not only prove sufficient for the absorption of such stocks, but lead to an enhanced demand in the near future. Should this year's monsoon be good, the reduction in the currency reserves may make purchases on Government account not impossible toward the end of 1910.

THE NICKEL INDUSTRY.

This unsigned article was written at the request of the Canadian Mining Journal. It presents the case for those who think that the market for nickel could be largely expanded were the market price lowered. The author desired to preserve his anonymity.

There are practically only two sources from which the world's nickel supplies are obtained, viz:—The Island of New Caledonia in the Southern Pacific Ocean, and the Sudbury district in Ontario. From the ores of the former, about 15,000,000 lbs. of nickel, representing 40 per cent. of the world's production are produced annually; whilst the ores of the Sudbury dictrict yield about 21,000,000 lbs. yearly, or 60 per cent of the world's production.

The New Caledonia ore occurs as a silicate of nickel and magnesia, in large surface deposits, covering a considerable area of the island. It is soft and easily mined but, owing to the isolated position of the island, its climatic conditions, the scarcity of labour and the absence of fuel, and necessary fluxes, it cannot be treated on the island itself, but is shipped to Europe in the raw state. This renders it necessary to bring the ore up to as high a nickel content as possible, which involves a large amount of handworking, as no mechanical concentration is practicable. The ore as shipped, averages 5½% nickel in the natural state, which, as the ore carries about 20% moisture, is equivalent to about 7% in the dry. The cost of the ore, delivered in European ports, is $8.50 per ton, or 7 cents per lb. of nickel contained in the ore. It is smelted with iron pyrites and gypsum to form a matte, and although the subsequent extraction of the nickel from the matte is considerably cheaper than the necessary separation of the copper from the nickel in the case of the Sudbury matte, yet the initial cost of the New Caledonia ore delivered at the smelter is so great that the ultimate cost of the production of nickel must remain in favour of Sudbury ores. All the output from New Caledonia is shipped to Europe.

The world's total production, therefore, is a little more than 36,000,000 lbs., or 18,000 tons, of which probably two-thirds is used in the manufacture of nickel steel, and one-third in the production of white metal, nickel coinage, electro-plating, etc. Of the output of nickel steel, by far the larger proportion is put into armour plate, turrets and heavy guns, for battleships; this steel contains usually 3½% nickel. It is also used

to some extent for other purposes, e.g. propeller shafts, crank axles, ship plates, deck plates, automobile frames, &c., but it would be used much more universally for these latter and other purposes, if manufacturers could secure supplies of the metal at lower prices than is now possible.

It is generally accepted as a fact that the control of the nickel market is vested in the International Nickel Company who, by agreement or arrangement with the French Company "Le Nickel" (the owners of the principal mines in New Caledonia) and with Mond's Nickel Company (the only other producers at Sudbury), fix and maintain the price of this metal in all markets. The supply of nickel may therefore be considered a monopoly, and the price has been kept at such a high level that the use of the metal for many purposes for which it is essentially adapted, has been made prohibitory. It is a significant fact that the consumers who pay the lowest price for nickel are those large and financially powerful firms who manufacture ships of war and their equipment for the Governments of their respective countries, and this was only brought about by a combination of the firms which the interests controlling the nickel market find too powerful to resist. The price of the metal to these consumers is about 26 cents per pound, but manufacturers requiring nickel for the production of nickel steel for any other purpose than ornaments have to pay about 35 cents per pound, whilst white metal manufacturers and nickel plating works, pay anything from that figure up to 60 cents per pound, according to the quantities they consume.

These prices are out of all proportion to the cost of production, from Sudbury ore, which certainly does not exceed 15 cents per pound. This statement is corroborated by the profits made by the two companies operating there; the profits of the International Nickel Co. are in the neighbourhood of $3,000,000 a year, on their output of about 17,000,000 lbs. of nickel, whilst Mond's Company's profits exceed $550,000 on an output of about 4,000,000 lbs.

There are millions of tons of proved and valuable ore in the Sudbury field awaiting development and exploitation. This district certainly affords an instance, unique in mining experience of such immense bodies of valuable ore lying unworked year after year, one might almost say decade after decade. And what is the reason for this state of affairs? It is not owing to the lack of a process for treating the ore, for notwithstanding the cloud of mystery with which the processes at present in use are purposely enveloped, they are perfectly well-known, and any patent rights that may have at one time attached to them, have expired long ago. Nor is it owing to the want of a market for the products of these ores, for anybody who has investigated the subject at all knows perfectly well that all steel manufacturers are anxious to secure supplies of nickel if they can be obtained at a price commensurate with the gain in strength and the saving in weight, which the use of nickel steel has over ordinary steel.

The only conceivable reason for the large bodies of ore lying unutilized is on account of the control of the market being vested in a powerful combination, who have bound the principal consumers to them in a most ingenious manner, and who deter capital from embarking in the enterprise. Naturally they are quite content with the profits they are making; why should they incur more capital expenditure in opening more mines, and increasing the capital of their plants—which they would be compelled to do in order to make the same profits from a lower price—when they know that their position is absolutely secure? So long as matters are left in their present condition, so long will the more universal use of nickel be prevented, and so long will the enormous and valuable deposits at Sudbury remain unutilized.

A NEW ELECTRIC PROCESS FOR PRODUCING AND REFINING STEEL WITH COMPOSITE ARC ELECTRODES.

By Frank C. Perkins.

A new process of producing a high grade of steel, low in phosphorus or with any analysis desired as described below is of interest, the construction and arrangement of the electric ladles or furnaces provided with special composite electrodes being seen in the accompanying drawings, the covers not being shown. This process on which United States patents have recently been allowed consists in electrically treating molten iron from a blast furnace or low grade molten steel as taken from a Bessemer converter or open-hearth furnace, with electric heat produced by arcs formed between the slag of the bath and specially designed electrodes. Several forms of composite electrodes are indicated in the drawings. It will be noted that one consists of a cored carbon or a mixture of carbon, and lime or oxide or iron or other slag producing materials. Another shows the slag materials packed in an iron or steel tube and still another surrounding a carbon or iron rod or rods with or without projections for supporting the slag materials with the usual binder employed in carbon electrodes.

It may be stated that the use of the composite or combination electrode, instead of the ordinary carbon electrode or an electrode of pure iron, introduces the fresh and additional refining slag materials to the bath fused and in a highly fluid state at the hottest points which are at the arcs or at the point of contact of the electrodes and the layer of slag floating on the bath of molten steel.

When two of these electrodes are used in an electric furnace of the double pole type, the current passes from one electrode into the slag, through the slag as a resistance and out of the other electrode, the two arcs operating at about 100 volts pressure. One electrode may extend into the slag or down into the molten steel below the slag, a single arc only being employed at this time formed at the other electrode, with a pressure of approximately 50 volts.

The double pole electric furnace is well adapted for practising this composite electrode process similar to the Heroult method because when the two electrodes are introduced into the refining slag, the latter acts as the resistance and forms one or two arcs according to whether one or both electrodes are out of contact with the bath and producing the arc and arcs. If one arc is used the other electrode may be raised and lowered by electric motor driven hoist stirring the molten bath by this action.

An ordinary basic lined ladle, crucible or pot may be used as noted in the drawings without cover which may be supplied in the same manner as a basic lined two pole electric furnace. This ladle having received the charge of molten steel from a Bessemer converter is electrically refined by eliminating the phosphorus and sulphur, as far as desired and the steel is deoxidized and recarburized. The steel is then poured into the ingot molds after an electric treatment of from a few minutes to an hour or more in the electric ladle according to the degree of refining desired.

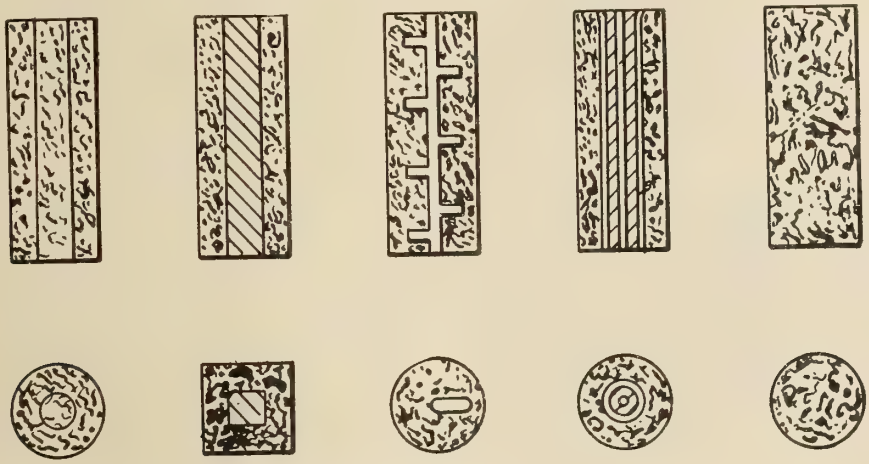


Fig. 1 Showing Suggested Forms of Electrodes to be Used in Ordinary Arc Furnace.

When only one of these electrodes is used in an electric furnace this electrode extends into the refining slag forming the arc at this point, the current being conducted through the molten bath and out through the bottom of the ladle similar to the Girod process.

Another construction shows double arc or single arc action taking place when the ring of cylindrical electrode is arranged on a level with the slag. A single arc action only at centre may be employed, the outer electrode dipping into the slag or molten steel.

By this electric arc process the molten metal continually circulates, all particles of the bath coming into contact with the refining slag at the arc or arcs and elsewhere and being rapidly refined, remaining at the highest temperature only a short time, then replaced by other particles of molten steel reaching the slag near the arcs.

It is held that in Heroult arc steel furnaces the circulation in the bath is always active and the average temperature may be kept as low as any other furnace and all parts of the bath come rapidly into contact with the slag. In case a deep bath of say 10 or 12 tons or more is used in the electric ladle and additional circulation is desired, one electrode may be plunged up and down in the metal by an electric hoist mechanism, while the other electrode produces the single arc then used with the slag.

By the use of these special electrodes made with slag producing materials the highly fluid slag at the arcs causes rapid circulation to take place and the gases are removed which are often retained in metal and cause bad steel when poured into the ingot molds directly from the Bessemer converter without electric refining.

Furthermore, in this electric refining process segregation of sulphur and phosphorus are largely avoided while any quality of steel may be produced regardless of the quality of the raw materials.

It is well known that the Bessemer converter process for making steel is far cheaper than the open-hearth process, but the quality very largely depends on the metal, ore and other material available, and it is not possible to test the metal during the operation. The resulting steel, therefore, from high phosphorus and high sulphur charges contains an injurious quantity of sulphur and phosphorus which cannot be eliminated by the existing acid Bessemer process. Too much or not enough carbon, manganese silicon or other elements can readily be corrected and gauged by the charge introduced into the converter, and subsequent treatment, but phosphorus and sulphur less than .09 and preferably below .05 is desired and this is not attainable by the existing Bessemer process.

With these special electrodes and the use of an electric arc for refining purposes, materials can be used in the electrodes or added to the bath for a neutral slag, as it is maintained that a thorough deoxidation of the steel is not possible when there are iron oxides in the slag as they will react to a certain extent with the molten bath of steel.

It is held that adding carbon under ordinary conditions will not result in complete deoxidation as both iron carbide and ferrous oxide readily exist together. By means of the electric process of steel refining with these combination or composite electrodes, however, carbon or a mixture of carbon and iron may be added to the slag as an auxiliary to the carbon mixture of the electrode, forming calcium carbide and resulting in deoxidation without the slightest difficulty at no great expense, and on any scale desired by providing electric arc apparatus for several electric furnaces, ladle cars arranged for serving various Bessemer converters or open-hearth furnaces.

The desired amount of manganese can be added for counteracting the bad effects from the ferrous oxide, the carbon reducing the manganese ore which has been

added to the slag and taking out the last traces of ferrous oxide leaving the steel bath protected by the layer of slag from oxygen in the air so that no further oxidation takes place.

The determining questions of the electric refining of steel, are cost and output. By shortening the time of treatment with these special composite electrodes combined with slag producing mixtures, and refining only down to such percentage of phosphorus and sulphur as are essential for rails and structural steel, the electric power consumed is so low, and the time required so short as to be practical for this work.

By this process cheap ore can be used having higher phosphorus and sulphur, these ores being abundant while high grade ores are nearly exhausted.

This new composite electrode process may be utilized as an auxiliary treatment to the Bessemer process for eliminating the phosphorus by employing an oxidizing slag in the bath as the molten metal is treated in the electric ladle with the arc, the auxiliary slag producing materials in the combination or composite electrode acting instantly on the metal, and the slag being in a highly fluid state as it melts in the high temperature of the arc.

The highly oxidized metal from a Bessemer converter overblown, may be utilized deoxidizing same in the electric ladle by this process. It may be stated that the desired end to be attained by this electric auxiliary process with the Bessemer converter for rail making particularly, is the reduction of phosphorus, to .05 or thereabouts by the oxidizing slag and electric arc, the other elements being easily controlled by existing Bessemer methods.

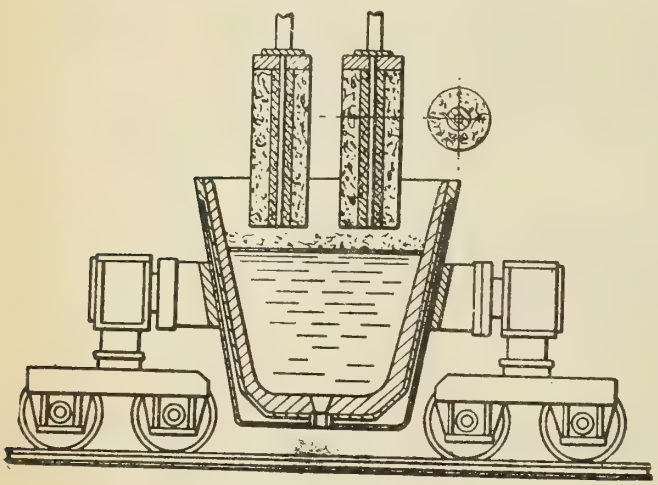

Fig. 2. Electrodes Used with Ladle.

It is well known that the Heroult electric furnace having pure carbon electrodes and a treatment extending from 75 to 90 minutes or more taking molten metal from an open-hearth furnace and electrically treating same with oxidizing and neutral slags, the phosphorus can be brought down to .003 per cent. and the sulphur down below .007 per cent. according to time of treatment.

By the use of composite electrodes containing slag producing mixtures it is possible to reduce the phosphorus to .03 or .05, which is 10 to 20 times as much as the above in a far shorter time and within practical limits for Bessemer working, only a small part of the phosphorus being removed.

It is also well known that the carbon is always eliminated before the phosphorus, and if it is attempted to carry the reduction far enough to lower the phosphorus, in an open-hearth furnace the metal is highly oxidized and decarburized.

This composite electrode process provides a means of taking the highly oxidized metal from the open-hearth furnace, if carried far enough to eliminate as much phosphorus as desired and by electric treatment with the arcs and these special electrodes having neutral slag mixtures, it is also impossible to eliminate, if desired, nearly the last traces of sulphur the metal being deoxidized and as much carbon being added as found desirable, producing a finished steel of any degree of perfection desired according to the length of time the electric treatment is carried on.

It may be stated that in metal taken from an open-hearth furnace, if the reduction is carried on long enough to reduce the phosphorus to .01 per cent. or less than this amount, the carbon is eliminated. It is of course true, that such a highly oxidized metal would be very unsatisfactory in practice but by means of the electric furnace treatment with these composite or combination electrodes, the arc and proper slag mixture in the electrode themselves acting as auxiliary slag producers, will bring most satisfactory results, eliminating the sulphur, adding the proper amount of carbon, and deoxidizing the steel completely.

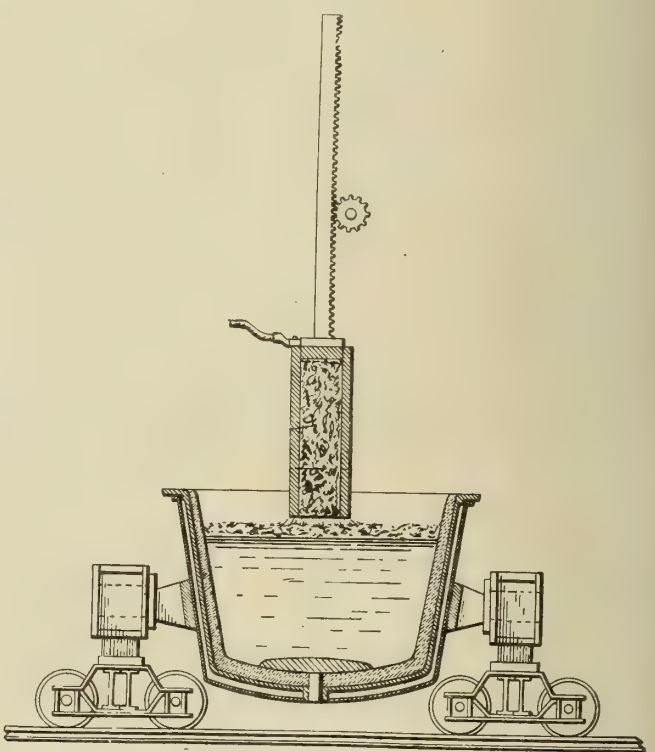

Fig. 3.

The proper mixture can be introduced into the molten bath and also provided in the electrode mixture to remove the sulphur on account of the high temperature of the electric arc even though the slags selected could not be used by any other than the electric treatment without addition of other slag materials to lower the melting point and this would interfere with the efficiency of operation. The slag mixture is also melted to a highly fluid state at the arc, largely from the mixture in the electrode itself, placed there for this purpose, in addition to that supplied in the ordinary way on the top of the bath.

Ordinarily there is great trouble and it is very costly to deoxidize the metal by existing processes and it is claimed that pipes and blow holes are produced in the ingot and other difficulties result from the presence of iron oxides. It is also maintained that when ferro-silicon and ferro-manganese are used to prevent these troubles, the oxides which result stay in the steel as an "Emulsion" in a finely divided state.

By this process of only taking the metal from the converter or open-hearth furnace when it is nearly finished steel and still molten, and merely completing the refining operation electrically, only ¼ of the electric power and less time is required than when electrically heating from cold metal. It is of value as an auxiliary process to the Bessemer converter and open-hearth furnace, taking the molten metal with little loss of heat and refining same to any degree according to time taken, the mixtures of carbon and iron or steel combination electrodes used and nature of slags employed.

While this process is specially adapted to the refining of molten steel taken from the Bessemer converter and open-hearth furnaces and treated in an electric furnace or ladle, it is not confined to this as the identical process will convert iron into steel from the molten or cold state without being previously treated in a Bessemer converter. Any grade of steel may be made regardless of quality of raw materials and carbon may be eliminated from electrodes for special steel making, the current being conducted to the arc by the iron rod instead of carbon and iron oxide, or composite electrode.

The neutral slag electrodes may work with a low current arc or dipping into slag and heating by resistance, and the steel may be kept for hours under this molten neutral slag without changing its quality. The metal may be cast, remelted or worked over to a higher or lower grade or it may be cooled, chilled, and melted a second time without injuring the quality of the steel.

The cost of production in this process is low as most of the work of steel making is done by the Bessemer converter or open-hearth furnace, only the removal of small percentages of the phosphorus or sulphur from the steel being attempted or the deoxidation of the metal, this being a good product for the larger rolling mills which supply the demand of rail and structural steel interests. The partial removal of the injurious phosphorus and sulphur reduces the time to a few minutes instead of hours, hence reduces the current required per ton.

It may be stated that the shorter time also lowers cost of linings and refractory materials per ton of metal and many charges may be treated in same time required for treating one open-hearth charge by existing process with gases alone. This shorter time process only reducing phosphorus from .09 to .05 for rail steel instead of to .003 which is possible by longer treatment, makes it a practical process for rail mills dealing with Bessemer converters treating full charges of 15 tons in electric ladles, handled by cranes taking same to positions where electrodes are inserted.

After treatment the metal is drawn from the bottom of ladle or tilted and poured into the ingot molds after slag has been removed. These simple methods are of vital importance as any new process for removing phosphorus and sulphur should not greatly increase the cost of power; should not cause excessive cost for basic linings or electrodes, or slag producing materials; and should be readily used as an auxiliary process in existing Bessemer plants.

THE RELATION OF MINING TO FORESTRY.

By B. E. Fernow, Dean of the Faculty of Forestry, University of Toronto (Annual Meeting, C. M. I., Montreal, March, 1909.)

In order to give to the discussion on the relation of the mining industry to forestry some local colour, rather than in the expectation of securing very valuable data, the writer recently sent a circular letter to mine managers in various parts of the Dominion, in which questions were put to them in regard to the use and the conditions of local supply of mine timbers. Their replies have been utilized in arriving at some general conclusions.

A canvass of the mines of the United States, made by the writer twenty years ago, afforded information showing a minimum consumption of not less than 150,000,000 cubic feet—the annual growth of at least three to four million acres. In the coal fields of Pennsylvania, for which the best data were available, the consumption varied at from one-half cubic foot to one and a half cubic feet of timber per ton of coal mined (bituminous). The iron mines of the Lake Superior field required over two cubic feet per ton; but the open pit mines were supposed to reduce the wood consumption for the total iron ore output to one cubic foot per ton.

In the precious metal and other mines the variation was found too extreme to afford data on which to base satisfactory conclusions. While the Bodie mine used 4.5 cubic feet per ton of ore, the Ontario could produce 100 tons with an average utilization of 6¼ cubic feet of timber. On the other hand, the timber consumption in such mines as those of the Comstock, the Montana and the Leadville mines, where large ore bodies are stoped and the Nevada system of timbering and cribbing is employed, is enormous. In 1887 the great Anaconda mine alone consumed over 1,000,000 cubic feet of mining and building timber, besides burning a large quantity of fuel-wood for smelting, this latter consumption in one camp alone amounting to 300,000 cords.

If it were assumed that the increased ore tonnage, during the last twenty years, was accompanied by a proportionate increase in wood consumption, the above figure would require to be increased to 500,000,000 cubic feet; roughly speaking, the annual growth of 10 million acres of well-kept forest.

We are not in a position to make even such approximations as these to the wood consumption by Canadian mines, for while most courteous replies were received from Canadian correspondents, they did not afford sufficient data upon which to issue a statement in any sense comprehensive. The impressions left by the perusal of the replies would, however, lead to the following generalizations:—

1. Canadian mines apparently use very little timber, conditions of rock in most localities being favourable, and roofs requiring little support. Shafts and shutes, and structures above ground, are responsible for the bulk of the consumption. Yet at some of the mines the consumption approaches that prevailing in the United States.

From the few reports available, the information points to a consumption of between one and eight cubic feet of wood per ton of ore mined. One of the Rossland mines indicates 1½ cubic feet, and at one of the Kaslo mines as much as eight cubic feet, which in these sections of the country can be purchased at a cost of about eight to twelve cents a cubic foot; while the Granby mines indicate a

consumption of hardly one-third of a cubic foot. A very complete report sent in by the International Coal and Coke Company, of Alberta, indicates a consumption of two cubic feet per ton; the cost varying from two cents per lineal foot for dead, to eight cents for green timber, largely poplar and spruce, or say an average cost of five to six cents per cubic foot of timber cut on the company's own limits. The consumption of the Nova Scotia Steel and Coal Company is also, probably, in the neighbourhood of two cubic feet at a cost of four cents per ton of ore. The Oldham gold mines use three cubic feet per ton, the cost of purchased material being from three to five cents per cubic foot for stulls and poles, and six to twelve cents for better class timber and lumber. The Dominion Coal Company, while using perhaps the largest absolute quantity of any Canadian enterprise in the neighbourhood, namely, of 1.5 million cubic feet, shows a very small per ton consumption, hardly one-half a cubic foot, the pillar and stall working being mostly employed.

2. The life of timbers underground, which is, of course, variable according to water conditions and mine ventilation, seems, on the whole and as one would expect, longer than in the warmer climate of the United States. In the well drained workings of the Oldham mines the timbers are crushed by the heavy hanging long before their durability is tested; while, curiously enough, in lower, flooded workings the same class of timber supported the hanging; but the theory of the writer's informant, that the water contributed to their support, is scarcely tenable. Moreover, the increased moisture contents of the wood reduces its strength to its minimum, so that the probable explanation can be sought only in a different distribution of pressures in the lower levels. In the dry climate of the Rossland district, seven to ten years' life, at least in shafts, is not uncommon, with a reduction in the drifts to five and even three years. The Granby reports timbers put in when first opened nine years ago, still in good condition. In many districts, mines have hardly yet been worked for a sufficient length of time to afford data on this point. The kind of timber employed would also require to be considered in this connection.

At the International mine of the Dominion Coal Company timbers have in some positions remained in good condition since 1869. In other parts their life has been less than two years, and they are mostly affected by rot in the first year, and that without distinction of species.

It is interesting to note that this company is experimenting with a process of treating timbers to increase their life, but as yet without arriving at valid conclusions.

3. Throughout the eastern provinces the most satisfactory timber seems to be furnished by the spruce. The statement is made that it is found to carry greater loads and to stand heavier shocks than any of the other timbers found in the northern country. This would seem strange wherever the pines and hemlocks are in competition.

At the Dominion Coal Company's mines tamarack is given the preference, and next to it black spruce, which is supposed to have longer life; but lately the balsam fir is becoming the main supply. It is the least desirable species in point of strength and life. This balsam, as the writer had reason to ascertain, forms fully 75 per cent. of the timber on the Cape Breton plateau, from which these mines are probably largely supplied. Another reason assigned by the reporter is that spruce on the mainland has been either largely cut out or brings a better price as pulpwood, and hence the mine is obliged to depend on the poorer material.

In eastern Ontario, the most satisfactory results underground are said to have been secured from the use of elm; except that its life is shorter than that of spruce. For lagging, cedar, which is the most lasting wood, is preferred if obtainable. In British Columbia the best timber is, of course, the red fir, while the larch is rather brittle, yet, in comparison with spruce and bull pine, superior.

4. The question of the continuity of supplies in the face of the relatively small supplies required, causes as yet little concern. Most of the Canadian mining enterprises are so young that local supplies have so far appeared ample, and prices low. Yet it is significant to note that in some instances not only is the increase in prices due to increased haulage, commented on, and felt to be a burden, but the needs of the future are beginning to be considered. From the General Chemical Company, operating at Sulphide at a depth of now 400 feet on an ore body 22 foot width, the statement has been received that "mine timbering was an expense to which we could not afford to go." And the writer expresses the belief that with proper management, timbering might be almost entirely dispensed with, except for shafts and shutes.

This statement recalls a similar example from the Menominee range, once one of the best timbered sections of Michigan, where a systematic rock filling method proved itself 50 per cent. cheaper than the use of timbers. A similar system is, in part, employed by the Canadian Copper Company, which uses not only rejected rock, but low grade ore, "this ore filling forming an ore reserve, mined and ready to hoist at a moment's notice."

Again: "The Eustis Mining Company of Capelton, Quebec, has experienced great difficulty of late years in getting satisfactory mine timber, and it is quite evident that this difficulty will increase from year to year. There is practically no satisfactory mine timber to be had within a reasonable distance from us. The probability is that we shall have to alter the system of mining to conform to the new conditions."

In other correspondents the question seems also to have stirred up the contemplation of diminishing supplies in the future, which future is being shortened by the much greater demand for wood materials from other than the mining industry.

Some of the mining companies own or control their own limits; but even these more providential concerns have, perhaps, scarcely realized that further wisdom may be applied in the manner of utilizing these properties, in order to insure continuous supplies. In other words, that just as they apply system and technical skill in exploiting their mines, they should manage their wood properties; they should practise forestry.

The first intelligent class of manufacturers, which has realized that provision for continuity of supplies of raw material is absolutely necessary, are the paper manufacturers, who have begun to practise forestry on their limits. Thus the Laurentide Paper Company employs a forester with a staff of 42 men to manage its large buildings. The Riordon Paper Company has commenced this work with a staff of a forester and 12 assistants to prepare for a regular management. These facts should stimulate other timber land owners to emulation.

To most people the word forestry is a synonym for tree planting; or else, if they do not dismiss it from their minds as a fad, they conceive its purpose is to make

mismanaged, culled woods again productive. What every timber land owner should realize is that forestry —intelligent planning—should begin when the first tree is cut, for by the mere manner of exploiting his property he may make or mar its future. Forestry in the timbered country means to so cut the timber as to secure a natural reproduction without the necessity of planting; the mere use of the axe securing this result. The forester is then a logger who besides harvesting the logs can direct the wood chopper to do his work so as to secure a desirable aftergrowth.

How this is done may not be stated briefly and in general terms, for each case requires its own diagnosis and prescription, but it requires more than is generally believed—more than merely cutting to a given diameter limit, or removing only the "mature" timber, to secure this reproduction.

To describe silvicultural methods would be beyond the scope of this paper, the object of which is merely to invite mining engineers to a fuller realization of the fact, that wood supplies are an exhaustable but restorable resource, and that by proper management exhaustion can be prevented.

If the needs of their mines do not call as yet for provident measures to secure continued supplies, the writer would remind mine operators that besides being managers of properties, they are also citizens, who should take a general interest in the conditions of their country. Moreover, they are, by their occupation, placed in localities and positions where they can exercise—more than any other educated class—a wholesome and intelligent influence on the rest of the community.

While the mining industry has not directly consumed much of the timber wealth, it has indirectly been responsible for untold damage to forest growth. For a large part of the devastation by fire is chargeable against prospectors who burn over the ground to facilitate their work, and forest destruction, particularly in the Rocky Mountain regions, is largely attributable to this cause.

For this damage, atonement should be made by a special effort on the part of the more intelligent mine managers to assist in preventing further damage and to throw their influence into the balance to raise the standard of commercial morality to a proper realization of the enormity of the offence of the "fire-fiend."

THE NISSEN STAMP IN COBALT.

The two Nissen single-stamp units installed last autumn at the mill of the Northern Customs Concentrators Company (nee Muggley), Cobalt, started dropping early in September; but throughout the latter half of October and through the former half of November the stamps were out of commission. owing to lack of power. On November 25th they were again started, and have been working continuously ever since.

The two stamps, each of which has a circular individual mortar, developed a capacity of 5½ tons per stamp per twenty-four hours through 30-mesh screens. The ore, La Rose dump stuff, is extremely refractory. Each stamp weighs 1,650 pounds.

As a basis of comparison, it may be mentioned that the corresponding duty performed by each stamp of the ordinary 5-stamp battery (stamps 1,250 lbs. each) was about 2¼ tons per day per stamp.

Thus the two Nissen stamps are credited with 11 tons per day, the 5-stamp battery with 11¼ tons. The power consumption is, roughly, 40% to 50% less for the Nissen stamps than for the 5-stamp battery.

Record of Trial.—Ore was fed to the Nissens at a size of one inch or slightly larger. The ore consisted entirely of conglomerate, and was extremely hard.

The stamps dropped 100 drops per minute, height of drop 7½ inches. The foundations were of 8" x 8" timbers, set on concrete. The timbers were grouted with concrete. Had the foundations been entirely concrete, absorption of shock should not occur.

The Nissen individual mortar weighs only 3,000 lb. The ordinary 5-stamp battery mortar weighs about 10,000 lb. Hence the Nissen stamps are handicapped by a more or less resilient foundation.

Contrary to the expectations of some of those interested in the trial, the screen wear on the Nissen mortars was not excessive. The shoes and dies wore evenly and smoothly.

The Nissen independent circular mortar is provided with a screen that represents roughly a segment of a circle slightly greater than a semi-circle. The screen is vertical, and thus every aperture is normal to the splash radiating from the centre of the die. This, of course, makes for rapid discharge. Wear on the stamps is compensated by means of weights placed upon the boss-head, which extends out of the mortar. Thus the stamps can be kept up to maximum duty.

The above remarks are given to shew a few of the advantages claimed for the Nissen stamp. The tabulated records below speak for themselves. Attention is drawn to the percentage of silver in the different sized products, also to the proportion of slimes produced by the Nissen and by the ordinary stamps.

Sample from Five-Stamp Batteries, Dec. 2nd, 1909.	Percentage of Sized Pulp.	Assay Value per ton of 2,000 Pounds.	Silver in each Fraction Calculated on 1-T. of Ore.	Percentage of Silver Contents of Ore in each grade of sized pulp.
Pulp retained on 40	5.19	13.8 oz.	0.73 oz.	3.50
" passing 40 retained on 60	13.75	25.4 "	3.57 "	17.15
" " 60 " 80	18.23	20.5 "	3.78 "	18.35
" " 80 " 100	3.21	23.8 "	0.78 "	3.74
" " 100 " 200	8.48	23.4 "	2.02 "	9.70
" " 200	48.82	19.8 "	9.89 "	47.51
" as sampled		22.2 "	20.81 "	

Sample from the Nissen stamps, Dec. 3rd, 1909.	Percentage of sized Pulp.	Assay value per ton of 2000 pounds.	Silver in each fraction calculated on 1-T. of Ore.	Percentage of Silver contents for Ore in each grade of sized Pulp.
Pulp retained on 40	8.56	12.8 Ozs.	1.11 Oz.	9.88
" passing 40 retained on 60	13.92	10.0 "	1.41 "	12.55
" " 60 " " 80	19.73	12.6 "	2.52 "	22.43
" " 80 " " 100	3 40	8.4 "	0.29 "	2.58
" " 100 " " 200	6.39	11.2 "	1.06 "	9.43
" " 200	43.39	11.0 "	4.84 "	43.09
" as sampled.		12.0 "	11.23 "	

Details of Rough Classification Test on 200-Mesh Product from Nissen Stamps. — 20 grains of pulp were taken and thoroughly mixed with clear water, and settlement was allowed to take place for a very short space of time (less than a minute), and the water holding the finer portion of the pulp in suspension was poured off. This process was repeated with the pulp four times, thus obtaining four products from settlement and one of float matter. Results were as follows:—

First settlement 24.50%
Second settlement 15.75%
Third settlement 36.75%
Fourth settlement 18.30%
Fifth floating matter .....4.05%, slimes

LEGAL COLUMN.

LEGAL COLUMN.

The Office of Mining Commissioner.

It has been claimed as one of the features of the Mining Act of Ontario that the office of Mining Commissioner does away with the cumbrous proceedings of the courts and facilitates the trial and disposal of disputes regarding mining claims.

One may have doubts, however, as to the advisability of the practice which is growing so common of creating commissions and commissioners to supersede the regular courts. The machinery of the courts, while cumbrous, is adequate. Its movement is as certain as it is slow. We should not be too hasty to discard the result of many years' growth and adaptation.

The success of the Dominion Railway Commission has been responsible for the creation of numerous other commissions, including the Ontario Railway Board, the Public Utilities Commission in Nova Scotia, and doubtless also the Mining Commissioner for Ontario. The Dominion Railway Commission is successful, however, rather in spite of itself. It has been singularly fortunate in having for its three chairmen one man of long legal and administrative experience and two of judicial experience, all of them exceptionally able men. While its power is great, its jurisdiction is concentrated on a few corporations whose means of communication and transportation are exceptional, consequently its localized and comparatively meagre machinery does not limit its effectiveness.

The same results have not followed the erection of the Ontario Railway and Municipal Board nor, it is submitted with due deference, that of the Mining Commissioner's office.

The Mining Commissioner, as a general inspector and referee of mining recorders, is doubtless an expedient and useful official, but his jurisdiction is much more extensive than is thus implied. Under Section 123 of the Mining Act of Ontario, subject to certain exceptions, "no action shall lie nor shall any other proceedings be taken in any court as to any matter or thing upon which before the issue of the patent any right, privilege or interest conferred by or under the authority of this Act depends, but save as in this Act otherwise provided, every claim, question and dispute in respect to such matter or thing, shall be determined by the Commissioner, and in the exercise of the power conferred by this section the Commissioner may make such order and give such directions as he may deem necessary for making effectual and enforcing compliance with his decision." Under this section a great variety and volume of cases arise in which no special knowledge of mining law or mining is required. Proceedings under the Mechanics' Lien Act are expressly excepted. But all questions relating to the ownership of unpatented claims, whether arising from trust, partnership or sale agreements, disputes depending solely on the facts and on principles of commercial law, are obviously of equal importance with purely technical disputes.

For these there is absolutely no machinery provided to the Mining Commissioner. It is often necessary that immediate proceedings should be taken, an injunction obtained, or the like. A certificate of "Lis Pendens" putting every purchaser on notice of a litigant's rights to any real property may be obtained from the court and registered in half an hour at a disbursement of $2.60. The same thing under the Mining Act cannot be done within, at best, two or three days, and a disbursement (exclusive of telephone and agency fees) of $10. The Mining Commissioner's only settled office is in St. Thomas. His duties require him to spend a great part of his time in the mining districts, where his movements are uncertain and communication difficult. He is not provided with any staff or office in Toronto, and, as everyone in actual practice knows, it is sometimes impossible for days to get before him. The inconvenience and foolishness of this is obvious, while at the same time the courts are right at hand with ample, accurate and well-known machinery for the relief of the litigant.

We do not wish at all to reflect on the present Mining Commissioner. Under a less industrious and painstaking official the situation would be worse.

Re Perkins and Dowling.

Appeal by the claimant Perkins from the decision of the Mining Commissioner for Ontario, by which he affirmed the validity of a certificate of record issued by the Mining Recorder of the Gowganda mining division to the respondent Dowling in respect of a mining claim in that division. The appellant asked that the certificate should be set aside, and that the respondent's claim should be declared forfeited for non-performance of the working conditions required by Sec. 78 of the Mining Act of Ontario, 8 Edw. VII., ch. 21.

The appeal case came on for hearing before Meredith, C.J., C.P., Teetzel and Sutherland, JJ.

Counsel for the respondent took the preliminary objection that no appeal lay from the decision of the Mining Commissioner confirming the validity of the

certificate of record issued by the Mining Recorder, citing Sub-Sec. 4 of Sec. 78 of the Act, which provides that "the Recorder, if satisfied that the prescribed work has been duly performed, may grant a certificate, . . . but he may first, if he deems proper, inspect or order the inspection of the work, or otherwise investigate the question of its sufficiency, and his decision thereon shall be final unless appeal is made to the Commissioner, whose decision shall be final."

Counsel for the appellant argued that the decision of the Commissioner was not final unless he had made an inspection or investigation under the above provisions of the Act.

At the conclusion of the argument on the question of jurisdiction, the judgment of the Court was delivered by Meredith, C.J., dismissing the appeal, on the ground that the decision of the Commissioner was final, whether or not any inspection or investigation had been made by him before giving his decision.

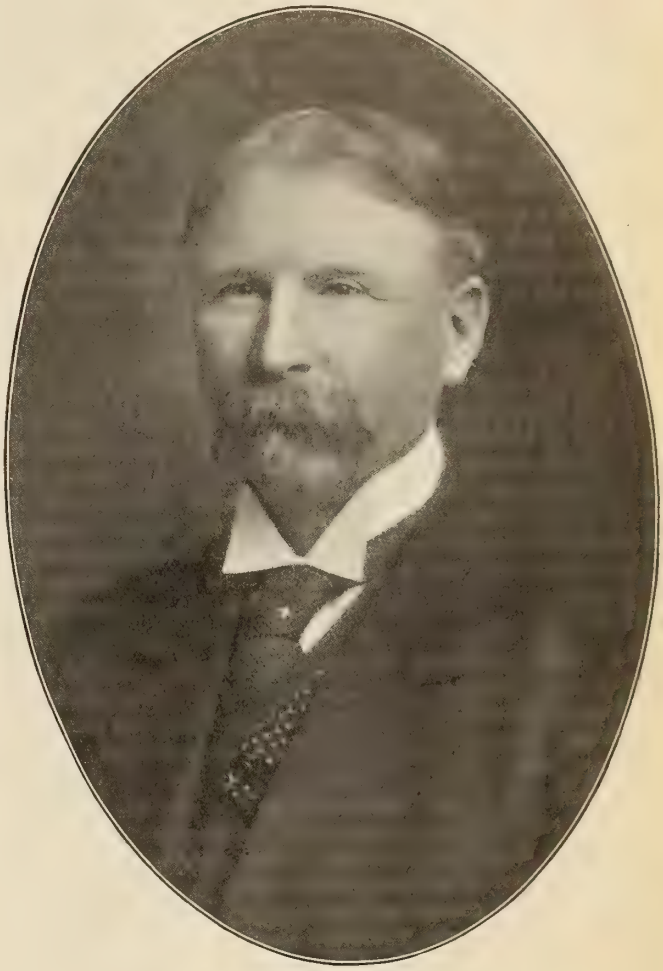
As the point was a new one, no costs were awarded.

PERSONAL AND GENERAL.

Mr. R. B. Lamb, of the C. L. Constant Company has left New York for Central America, on important examinations. He expects to be gone some time.

In our issue of January 1st, 1910, in the list of members elected to the Canadian Mining Institute, the name of Mr. D. G. Wilson, should have appeared as superintendent The Hosmer Mines, Limited. Hosmer, B.C.; instead of superintendent Crow's Nest Pass Coal Co.

EXCHANGES.



The Engineering and Mining Journal, Jan. 15, 1910.—According to the E. and M. J., neither Mr. Ballinger nor Mr. Pinchot will have lived in vain, if their row over Alaskan coal-lands leads Congress to appreciate the national importance of the immense coal deposits of Alaska. While making no attempt to excuse those persons who have been evading the law, the E. and M. J. very reasonably points out that Alaska is not a poor man's field. The coal lands will have to be exploited by rich corporations, or by nobody.

OBITUARY.

Harold A. Wiley.

To Ontario mining men, the death, on January 15, 1910, of Mr. H. A. Wiley, was a most unwelcome surprise. Mr. Wiley was a partner in the firm of Thomas Marks & Co. Associated with him, were his brother Mr. F. S. Wiley, and the late Messrs. Thomas Marks and George T. Marks.

Twenty years ago Mr. Wiley undertook the first diamond drill in the Atikokan Iron Range, and was instrumental in interesting Belgian capital. He was connected with the development of several silver mines, in the Port Arthur district. One of these, the West End Mine, shipped over half a million ounces during Mr. Wiley's connection with it. Mr. Wiley also was one of the pioneers in the exploitation of the Animikie Iron Range at Loon Lake, 25 miles east of Port Arthur. Along with his brother and the late George T. Marks, he was largely interested in the Port Arthur Mines Company Limited, of which, Messrs. MacKenzie & Mann are directors.

Mr. H. A. Wiley.

During recent years Mr. Wiley became interested in Cobalt, and was one of the owners of the Nugget Claim, and a director of the Smaltite Mining Company.

His interests were by no means confined to mining. As president of the Canadian Northwest Steamship Company he occupied an important office.

His sense of citizenship was broad. He was a member of the following clubs and associations:—The Albany Club, Toronto; The Jockey Club; Royal Canadian Yacht Club; Empire Club; Lake Shore Club; the Port Arthur and Fort William Clubs; the Boards of Trade of the Cities of Toronto and Port Arthur; and the Dominion Marine Association.

SPECIAL CORRESPONDENCE

ONTARIO.

Cobalt.—The Little Nipissing property has been coming into prominence again on account of the good results obtained in the development of the new vein found some time ago. This vein was found about 500 feet east of the shaft on the 165-foot level, and it has now been drifted on for over 60 feet, thirty feet of which is in good ore. The vein in places is about 5 inches of smaltite, carrying high values in silver.

The physical condition of the Cobalt Lake Mine has much improved of late, due largely to the developments on the vein found some time ago on the 190-foot level. From the work done

so far, it promises to be the most important ore body that the Cobalt Lake has ever discovered. Since this property was first bought from the Government it has been a great disappointment, but the work done during the past six months has given the most promising results in its history.

The new vein discovered on the 75-foot level of the Hargraves a couple of weeks ago has now been drifted on for over 20 feet, and already several tons of high-grade ore have been bagged. The vein in the face of the drift is about 5 inches in width, and carries high values in silver. The company is making preparations to sink the shaft an additional 50 or 75 feet, and from this point drifts will be run on the vein. High-grade ore is also being produced in the No. 3 shaft. This working was put down on what was supposed to be a continuation of the famous Jacobs vein of the Kerr Lake. Drifts on four levels failed, however, to give any evidence of silver. A couple of months ago a cross-cut was run north from the lowest or 380-foot level, and when in 60 feet encountered an ore body that has since been proved to be a continuation of the Jacobs vein. A drift was run on this for over 30 feet, and this ore is now being stoped.

The Wettlauffer Mine in South Lorrain, which has come in for a good deal of prominence on account of the shipments it has made lately, has received the smelter returns for the first three cars of high-grade ore sent out, showing a total content of over 200,000 ounces of silver. Up to date this company has shipped about 110 tons of ore, and it was the first property in New Ontario, outside the Cobalt camp, to make shipments. Practically all this ore has been taken out in development work, as the company had ore from the grass roots down. Sinking is being continued in the main shaft, which has now reached a depth of 160 feet.

The Temiscaming and Hudson Bay Company was the first to declare a dividend for the year 1910. The dividend amounted to 300 per cent. on the issued capital of the company. This brings the total dividends paid by this company up to 75,400 per cent.

Gowganda has at last commenced to ship ore, the first consignment from that camp being made by the Blackburn mine. The shipment consisted of 20 tons of high grade and 10 tons of medium grade ore. The former will probably carry in the neighbourhood of 2,800 ounces per ton, and the medium grade will assay about 500 ounces. There are already a large number of teams carrying supplies into the district, although the number is, of course, small as compared with last year. It is estimated that there will be about ten carloads of high grade ore to send out. The Blackburn will probably be one of the heaviest shippers as it is generally conceded to be the best property in that part of the country. It is rather a remarkable thing that this property is the only one in the Gowganda district that is in the conglomerate. The Bartlett, about which so much was heard a year ago, has been closed down and has reverted to the original owners, McLaughlin and McIntosh, the Bartlett Company having failed to make the last payment. The property, which is well located and has some good surface showings, might have made good had it been properly managed. It is a significant fact that absolutely nothing in the way of surface prospecting was accomplished last summer.

The new road into South Lorrain, which is being built by the merchants of Cobalt and the mine managers of Lorrain, is nearing completion, and as it will be about ten miles shorter than the old road, it will effect a considerable saving in time and freight charges, and teams will be able to make the round trip in one day. The shipments for the present year should show a large increase, as there are now seven prospects that are producing high grade ore.

Negotiations between the City of Cobalt Mining Company and Northern Customs Concentrator have been concluded whereby the City of Cobalt's dump is to be treated on a royalty basis. It is estimated that the dump contains about 11,000 tons that will assay approximately 25 ounces of silver per ton. This dump will augment very considerably the revenue from the mine, and with the reduction in the royalties that has been effected, and the bettering of the physical condition of the mine that has taken place within the past few months the company should make a very favourable showing.

The Otisse-Currie Company has decided to sell the plant that it originally had on its property. This plant was supplemented by a larger one to meet the growing needs of the mine and is now of no further use. It is understood that it will be bought by the Berlin Mine.

It has been determined to shut down the Union Pacific Mine, which is one of the leases of the Peterson Lake Company, for the present. The shaft was being sunk with steam, but having reached the point where this power was not satisfactory the directors decided to shut down till air from one of the power companies is ready. The shaft will be timbered and put in shape to recommence work as soon as the power is available. In the meantime work is mainly confined to the development of the Michigan Cobalt.

Despite the many promises made by the power companies regarding the date for the delivery of air and electricity, it is hardly probable that they will be able to fill their contracts before the month of May. The company that has made the greatest progress is the Mines Power, Limited. This company only commenced operations about last June, and since that time it has made remarkable progress. At one time it carried about 1,300 men on its pay roll, but this number has now been reduced to 750. The sub-station at Cobalt is practically completed and in a few weeks the large compressors will be installed. The pipes for the delivery of air are being distributed, and as these are of no great size it will not take long to connect them up. The Cobalt Hydraulic Company has still a large amount of drilling to do in its underground workings, and its facilities for handling the muck have decreased on account of the work to be done in the intake shafts. At the present time the whole camp is greatly handicapped by the lack of power, and the probability is that most of the mills now under construction will be finished before the power arrives. The work on many properties is less than it would be on account of the managers not wishing to go to the expense of putting in machinery for a few months to supply the extra needed power.

It is stated that at the Victoria mine a shoot of high grade ore has been encountered on the 80-foot level.

Stoping has commenced on the Waldman vein at the 75-foot level. At this point a drift was run to the west for about 70 feet, and from the end of the drift a raise will shortly be started on the vein. At the 75-foot level the vein was in one place about a foot under eight inches of smaltite carrying considerable quantities of native silver and about four inches of calcite. A diamond drill has been installed at the bottom of the shaft to locate the vein at a depth of 150 feet. Several tons of high grade ore have been obtained from development work and are ready to ship. Two veins have been found on Lot 99, bought by Waldman in the recent Government sale, but they do not contain any silver values. When air can be obtained a shaft will be sunk. The Waldman vein and the one on the York and O'Brien lots are the only discoveries of importance that have yet been made on the limit. It was largely due to the Waldman vein that the prices in the last sale of lots ruled so high. The great majority of purchasers are already regretting the prices paid as they were altogether out of proportion to the value of the properties.

Porcupine.—Less than three months ago Porcupine Lake was a place practically unheard of except by a few prospectors, and now it is one of the busiest portions in New Ontario. The big

gold discoveries made there have caused a rush of very considerable proportions, which even yet is only in its infancy. So far the best known claims are the Wilson, Bannerman, Hollinger, Miller, and Gillies; but many more important discoveries have been made. The Wilson has the most spectacular surface showings yet discovered, the vein being in places 75 feet wide, with the free gold scattered through it in various places. The Bannerman group of claims has been taken over by the firm of McArthur & Co., of Glasgow, Scotland, and they are making all preparations for carrying on operations on an extensive scale. The O'Brien people have taken an option at a large figure on the Gillies properties and they have a diamond drill working to test the vein at a depth of about 100 feet. As the time for the option has nearly expired the results of the boring are looked forward to with a great deal of anxiety by all who are interested in this new camp. It is understood that an effort will be made to get the option extended. The Tummins have an option on the group of claims known as the Hollinger and have a large force of men at work sinking test pits. As far as can be learned the results obtained have been very satisfactory. The option on these properties will not expire till the middle of February. Another important discovery of free gold is stated to have been made on the south-east corner of Tisdale, adjoining Shaw and Whitney, the samples showing free gold in remarkable quantities. A large number of Cobalt engineers and mine managers recently paid a visit to the district to look over different properties there and they were all very favourably impressed with what they saw. These men are well-known mine operators and their opinions carry considerable weight.

Considerable discussion has been raised by the action of Father Paradis in cutting through High Falls on the Frederickhouse River. As a consequence Frederickhouse Lake and Wilson's Creek are dry and Night Hawk Lake has been lowered about seven feet, a beach over a mile in width being formed around the lake. This action was taken without permission of the Dominion Government. An official has been sent up to see what is necessary to be done in the matter. The district as a whole is getting along wonderfully well, and with the good roads and easy transportation important developments may be expected before spring.

KENORA MINING DIVISION.

Kenora.—The Prospectors' and Mine Owners' Association of the Kenora Mining Division held its annual general meeting in the Town Hall, Kenora, on January 11th, at 8 P.M., when the following report was made by the secretary:—

Mr. Chairman & Gentlemen:—Since you have all taken an active part in the business of this Association it will be unnecessary for me to go into details, but I will take this opportunity of reminding you of some of the more important moves made by this Association during the past year.

First I may say that our paid up membership list for 1909 comprised 86 members, 24 of whom are now residents of Kenora and nine now residents of the province of Ontario, some coming from Manitoba, but the major portion from Detroit and its vicinity through the co-operation of the Shareholders Protective League whose head office is in that city.

Almost the first matter of importance taken up by this Association was the question of obtaining for the prospector and mine owner more consideration from the hands of the Government in connection with the timber of a mining location whether patented or not.

Next we took up an advertising campaign with the object of attracting the attention of those desirous of investing in mining enterprises, to this district, which campaign was inaugurated and to a large extent carried on by a series of articles and notices in The Canadian Mining Journal, which is probably the most reliable disseminator of mining news in Canada. And not to be forgotten among the other actions of this association is that of introducing to its members Mr. Geo. Thurber and allowing them to judge for themselves the advances made in his process for gold extraction. Finally I would point out that apart entirely from any actual results in Government action, or reaction caused by or obtained through the workings of this body, the very fact of having such an association in this district, has called attention to a greater or less degree to this country and has exerted an influence beneficial to the town and district as a whole.

Financially the Association is on its feet. Its books audited by your auditors, Messrs. Geo. W. Fullerton and C. H. Challoner, and by them found correct show a balance to your credit of $34.50, all liabilities having been discharged. I have the honour to remain,

Sincerely yours,
H. P. THOMAS,
Sec.-Treas.

After this report had been received the following officers were elected:—

Honorary President—Capt. H. A. C. Machin, M.P.P.
President—Major the Hon. J. E. P. Vereker (by acclamation).
Vice-President—Harding Rideout, Esq. (by acclamation).
Secretary-Treasurer—Herbert P. Thomas.
Auditors—F. W. Hockley, Thos. Walsh.
Committee of Twelve—J. S. Whiting, Thos. Walsh, Jas. Weidman, C. W. Chadwick, P. H. Austin, Leo. Stevenson, A. McMeekin, John Nash, A. Woods, Geo. Thow, T. J. Cherry, J. S. Harvey.

When the routine business had been completed, Capt. H. A. C. Machin took the opportunity of impressing upon the members the value of such an institution as that to which they belonged and roused the enthusiasm of the meeting by informing them that he had that day signed an option on the Mikado Mine and expected to see it in operation again this spring. The Mikado Mine has always been admittedly one of the largest gold mining propositions in this district, and in spite of bad management and a too lax overseeing of the miners, the mine has in the past been a paying proposition. The main shaft, however, which by the way is an inclined one, gave the former owners of this mine the impression that the vein had pinched out at a depth of approximately 250 feet. From Capt. Machin's own observations on a recent trip to the mine, by taking the strike and dip of the lode, he has come to the conclusion that the main shaft has passed outside of the containing wall of the vein through miscalculation on the part of those formerly in charge of the mine and that the mine is to-day in a position to equal its previous good record of gold output. This conclusion as to the direction of the lode has been reached, not by Capt. Machin alone, but by others of his party as well as by the man who for the last few years has been left in charge of the mine and plant by the company. This new conclusion relative to the former misjudgment of the strike and dip of the lode will account for the apparent pinching out of the vein, inasmuch as since the shaft of the retaining wall and the vein were not running parallel, but more gradually approaching each other it would give the effect of the vein gradually pinching out, while in reality a little drifting on the opposite side of the shaft would have proved the original lode to be there in its full width and not to have pinched at all.

The opening of this mine, in which many of our local men have such a firm belief, will, we feel sure, show the public that this mining district has not failed in the past through poverty in ore values.

BRITISH COLUMBIA.

Rossland.—The ore shipments from this camp for the first week of the year amounted to over 5,700 tons, which is far above the average that was maintained during 1909. The three

leading mines have started the new year with substantial shipments, the Centre Star over 4,000 tons for the week, the Le Roi 2, Limited, over 700, and the Le Roi nearly 400 tons. Rossland is in a good position to make a record year of 1910, and as a greater interest in mining seems to be awakening over the country generally it is highly probable that several of the companies that have been letting their mines lie idle here for the last few years will resume work during 1910. The situation certainly seems ripe for it. There are vast areas of mineralized ground about this camp and there is no doubt at all but other rich deposits lie hidden in Rossland's seven hills than those already uncovered. The coming year will be a propitious one for companies owning mines here to do development work as there is little doubt but what they would receive good financial support from the investing world. The valuable work done here by the Geological Survey of Canada and the vast amount of work done at depth in the leading properties of the district have changed things for the better from what they were five or six years ago. While there is nothing definite there are prospects of the Blue Bird Co. doing development work in the South Belt, and the Jumbo is also likely to resume operations late in the spring. The Hattie Brown will no doubt be worked, and rumour has it that a plan of development may be carried on at the O. K. gold property. The I. X. L., adjoining the O. K., is now being worked under lease. The gold in this ground occurs in a pockety form in a quartz vein on a contact between porphyrite and serpentine. This property is paying a little more than its own way and there is the element of chance in the probability of opening up a pocket of more than ordinary richness.

The Boundary.—The Granby mines, Mother Lode, Snowshoe and Oro Denoro mines, for the week ending January 8th, shipped ore aggregating over 40,000 tons. The outlook for the Boundary mines for the coming twelve months is probably brighter than it has ever been, but it is more than likely that the usual crop of drawbacks will creep in and hinder matters. Already a strike cloud is hovering over Greenwood, where the Miners' Union is demanding the closed shop of the B. C. Copper Co. As this is a most unreasonable demand, there being no other difference, apparently, if it is pressed it will surely end in a deadlock. As the miners of the surrounding districts, however, deem their Greenwood brethren somewhat temerarious and are not giving them the moral support that they would like, it is thought that the affair will not go much farther than it has.

The development of the Rawhide property of the New Dominion Copper Co. is being energetically executed and it is expected that the mine will begin shipping ore to the Greenwood smelter of the B. C. Copper Co. within ninety days. It is stated that as soon as the B. C. Copper Co. is assured a steady supply of ore for its three furnaces as is highly probable, it is the intention to resume the payment of dividends. The smelter is at present treating about 1,600 tons per day from the Mother Lode and Oro Denoro, but as some of this ore is being taken from the glory hole workings inclement weather is liable at any time to interfere with operations. For this reason the company is desirous of securing a steady supply of ore from the Dominion properties until its mine in Wellington camp has better shipping facilities, which are now being built.

The Greenwood-Phoenix Tunnel people have abandoned the idea of using a tunnelling machine for the present and have installed an air compressor at the mouth of the adit, with a view to using machine drills, which will be at work in a week or two.

The shaft on the Alaska-Buster property, near Beaverdell, is now down 90 feet, and the ledge has been opened up three feet wide with a 6-inch paystreak carrying $100 to $200 silver and lead. The Standard Fraction, adjoining, is also being worked. The Riverside, another West Fork property of promise, was recently examined by experts and may be soon worked by a local syndicate. Near Greenwood the E. P. U., Tip Top and Dynamo claims are being worked steadily. Operations are about to be resumed on the Bay mine with a crew of five men. The new machine shop at the Granby mines is about completed and the labour-saving machines are being installed. The new shop will prove a time and money saver for the mines of the company, being up-to-date in every particular.

Nelson.—The St. Eugene, Blue Bell, North Star, Richmond-Eureka, Van-Roi and other steady shippers appear on the list for the week ending January 8th, and in addition the Broadview mine, which has not shipped for a couple of years, sent out 31 tons of select ore. The Arlington shipped 20 tons. The total quantity of ore shipped and milled in the district for the first week of the year amounted to over 3,500 tons.

The prospects for the Slocan-Kootenay district for the coming year are very good. The Sullivan group of lead mines, at Kimberley, which were idle all of last year, will be extensive producers this year, under the lease held by the Consolidated M. & S. Co.; the Slocan Star is to be worked by the B. N. White Co., the Big Ledge zinc property will likely join the list of shippers and increased production may be looked for at the Richmond-Eureka and Van-Roi mines, while several new shippers will enter the list from the Sheep Creek section. W. J. Milne, of Vancouver, has bonded the Golden Gate, Fancy and Golden Fate claims in Poplar Creek camp, and work has been started with a crew of five men. It looks as though Poplar Creek district would have another innings this coming year. The Ethel mine in the Lardeau is under bond to Spokane mining men and a quantity of high-grade ore is being taken out of the property. A good strike of silver-lead ore has been made on the Iona group near Ymir. The Yankee Girl mine, near this group, is working a crew of about thirty men and shipping steadily. The Vancouver men who held the bond on the Alma M. property have permitted their bond to lapse and the original owners have put a crew to work on development on their own account.

Shipments from the Lucky Jim zinc mine are averaging about 355 tons per week, of about $12 per ton net. A new tunnel is now being driven 200 feet below the present workings, which will permit of more economical operation, gravity being used extensively in taking the ore out of the mine. It is said by the management that there is a body of about 60,000 tons of ore "in sight," from every five tons of which one ton of 50 per cent. zinc ore can be hand sorted; while it is expected the "second-class" ore will concentrate four into one of 50 per cent. zinc ore.

It has been said that some of the coal mines in the Crow's Nest district were thinking of building a number of coke ovens similar to those now in use in Germany, which save some of the by-products, lost in the ordinary bee-hive oven. This would seem to be a great step toward economy. It is said that as much as four gallons of tar useful for aniline manufacture and two pounds of sulphate of ammonia could be saved per ton of coal coked. In fact, the by-products have been found more valuable than the coke itself. As an instance, at the Crow's Nest Pass collieries, Michel and Fernie about 1800 tons of coke is made per day in the bee-hive ovens, a loss ensuing, roughly speaking, of about 14,000 gallons of valuable tar product and about 3500 lb. of sulphate of ammonia, to say nothing of possible illuminating gas, which could be used to advantage for lighting, possibly, and generation of power, surely. Without knowing all the actual conditions it seems as though it would pay the companies along the Crow's Nest to put in apparatus for distillation, providing a method that is not too slow can be found and adopted. Furthermore, the loss of these valuable by-products of coal year in and year out is not only a loss to the operating companies themselves but is a national loss that will surely make itself felt in due time.

GENERAL MINING NEWS.

NOVA SCOTIA.

Glace Bay, Jan. 17.—J. H. Plummer, President of the Dominion Iron and Steel Co., and Coal Co., and M. J. Butler, General Manager of Companies, spent this afternoon in town, and visited the various departments of the company's works here. They were accompanied by D. H. McDougall, General Superintendent of Mines and Quarries, and Hector McInnes, the company's solicitor. The early afternoon was spent in conference with General Manager Duggan, Mine Supt. B. McKenzie, Messrs. McEachern and P. Christianson, the managers of the general collieries and other officials.

Answering the inquiry as to whether he would meet a representative of the strikers, Mr. Plummer said that he had not met the representatives of the United Mine Workers Association, and that he did not consider it necessary that he should meet them. The position of his company ,as regards its employees had already been plainly stated, and a meeting with these representatives to discuss the terms on which the men now out of employment may return to work, might be misconstrued as a recognition of the United Mine Workers of America, which would be against the policy of the company since the beginning of the present disagreement.

President Plummer intimated though that any of the men now out of work would be taken back as soon as places could be made for them, should they desire to return.

ONTARIO.

Verona.—From the McDonald feldspar property at Verona shipments amounting to more than 3000 tons of this mineral were made in the last six months of 1909. The present output is about 500 tons per month.

Brockville, Ont., January 17.—Clifford E. Smith, mining engineer, of Brockville, has issued a writ in the High Court against Dr. Milton L. Hersey et al., of Montreal, purchasers of mining claims A26 and A39, and against the Wyandoh Silver Mines Ltd., of Cobalt. Smith claims his agreement was for a one-tenth interest in these properties, and asks for a declaration of his title to the same, and also for damages to the extent of $55,000.

Toronto, January 18.—A car load of silver ore from Gowganda, en route to Thorold, is expected in some time to-day. This is the first carload from Gowganda country. It comes from the Reeves-Dobie mine. It is consigned to the Conagas smelter at Thorold, where it will be treated.

Only a little more than a day sufficed in transportation along forty-five mile road through mush. On Friday morning twenty-five sleighs started, each one loaded with sacks containing about one thousand pounds of ore, and on Saturday afternoon the railroad was reached.

BRITISH COLUMBIA.

Greenwood, Jan. 7.—The local branch of the Western Federation of Miners has notified the British Columbia Copper Company that members in its employ at Mother Lode mine and local smelter will quit work on Tuesday, January 10th, unless the company agrees to employ members of the order exclusively.

The demand has been refused by Frederick Keffer, general manager, who, in reply, states that it would be impossible to coerce non-union employees to join the federation. As long as an employee was efficient he did not care anything about the man's creed, nationality, or connection with labour unions.

The situation here is acute, but it is hoped that a strike, involving the suspension of mining and smelting operations, resulting in the enforced idleness of 500 men, will be averted.

There has been a strong feeling in the ranks of the union employees because many of their fellow workmen refused to join the federation. Recently, as a test case, one of the non-union employees was fined $50 for refusing to join the federation, and later an additional $10 was imposed for failure to pay the fine.

MINING NEWS OF THE WORLD.

RUSSIA.

A report on the Russian naphtha industry has been furnished to the "Frankfurter Zeitung" by its St. Petersburg correspondent. "As far as can at present be judged," he writes, "the past year has brought retrogression rather than progress in the Russian naphtha industry. Over-production is on the increase, and the circle of customers is not being extended. As I learn from a competent source of information, the stocks of petroleum in 1909 show a considerable increase as compared with those of previous years. Prices at the same time display unusual fluctuations. This is a state of affairs that utterly contradicts the rumours current both here and abroad as to a secret syndication of the Russian oil-works. On the contrary, embittered competition prevailed the whole year through in the Russian oil market. Exact statistics of the petroleum output up to 1st December, 1909, are now to hand, and give a total of 449,580,000 poods, as compared with 433,180,000 poods for the corresponding period of 1908. That makes an increase of 16,400,000 poods of raw oil for the eleven months, which is to be attributed exclusively to developments in the Bibi-Eybat district. In all the other districts the output has receded considerably, a circumstance which appears to confirm the view that the old areas of exploitation in Baku are petering out. As to export, the estimated figure for 1909 is 28,000,000 poods, as against 90,000,000 poods in former years."

The Russian Ministry of Commerce is said to be considering the question of reducing the royalties levied by the Treasury on small-sized petroleum plots at Baku.

GREAT BRITAIN.

A meeting of the South Wales Coal Conciliation Board was held at Cardiff, January, 11th, to commence negotiations for a new wages agreement. The proceedings were preliminary in character. The men have given three months notice to terminate the present agreement, and unless a new agreement is decided upon before the notices expire the men will come out on strike. At present their demands are—the raising of the minimum wage from 30 to 40 per cent. above the 1879 standard and the abolition of the maximum wage, the payment of a

special allowance to colliers working in abnormal places, the payment in respect of small coal, the payment of six turns for five worked by night men, and that the lowest paid workman shall receive a standard wage of not less than 3s 4d per day. On the other hand, there was to be dealt with employers' claim to damages for the men's refusal to work the extra sixty hours provided for in the Eight Hours Act, and in respect of which the employers had obtained a Divisional Court decision in their favour. This matter was discussed at length.

The employers have not framed their proposals, but intimated that they would forward them to the Miners' Federation on Saturday. The owners expressed surprise at the men's demand for payment for small coal, pointing out that it was a violation of the Conciliation Board agreement, which provided that the cutting price paid upon the weight of the large coal included all services in respect of small coal. The men's representatives replied that, while anxious to carry out the provisions of the existing agreement in reference to small coal, they were bound by this demand to protect the men against the owners' claim for damages for the refusal of the men to work the extra sixty hours under the Eight Hours' Act. The owners declined to withdraw this claim for damages, and it was agreed that the differences between the parties on this point should not be a bar to proceeding with the negotiations for a new agreement. In order to prevent injury to the trade which would result from the prolongation of the negotiations up to the date of the termination of the men's notices on 31st March, it was agreed that a definite arrangement should be arrived at by 28th February, and that for this purpose the Conciliation Board should meet on Wednesday and Thursday in each week. The Board then adjourned.

The situation in the Northumberland coal trade continues unsettled. The miners are concentrating their efforts to resist the introduction of the three-shift system, under the Eight Hours Act. Several collieries have resumed work under the new system, but this does not mean that they are satisfied with the arrangement, but only that they are endeavouring to give the new working conditions under the new Act a practical trial.

The North-West Durham Miners' Federation, at a mass meeting attended by 3,000 men at Medomsley, on January 5, decided to remain loyal to the ballot of the local lodges and remain out on strike against the Eight Hour agreement, and also to ask other collieries at present working to cease until the dispute was satisfactorily settled. An amendment that the men resume work under protest for three months pending modification of the three shifts per day agreement was supported by about 50 men. It was announced that the Langley Park Colliery had struck work, and it was agreed to appeal to the collieries unaffected for financial assistance until a settlement had been effected.

UNITED STATES.

Colorado Springs, Colo., Jan. 11.—Not less than 30 high-grade fences are being operated in the Cripple Creek district, according to the mine owners who held the annual meeting of their association here yesterday, and the fight against the illegal traffic in ore is to be waged more earnestly than ever. The subject was the principal business discussed by the association members, more than 50 attending the meeting and outlined plans for the next year.

The reports showed that during the year $250,000 had been stolen in ore by the high-graders of the district, although much had been accomplished, it was reported, by the association in running down the thefts. Four convictions were secured during the year and the men are serving terms in the penitentiary.

CUBA.

The Havana Asphalt and Bitumen Company has been registered with a capital of £80,000, in £1 shares, to acquire a license to work the asphalt, bitumen and oil-bearing deposits known as the Mariel group of mines, Cuba, and also to adopt an agreement between the Havana Exploration Company of the first part, Havana investment Syndicate and the liquidator thereof of the second part; and to carry on the business of miners, refiners of and dealers in asphalt, bitumen, oil and other mineral substances.

Company Notes

The International Coal & Coke Company has increased its dividend from 1¼ to 1½ per cent. quarterly. The dividend is payable February 1, to shareholders of record January 20.

The management of the Nipissing Mines Company has sent shareholders the following brief statement showing the physical and financial conditions of the operating company on January 1, 1910 as compared with conditions on January 1, 1909.

1909 company shipped 6,510 tons, ore valued at net..	$2,210,364
1908 company shipped 3,505 tons, ore valued at net..	1,363,783
Increased tons, 3,005; net inc	846,581
On January 1, 1910 our cash surplus was	$1,322,985.50
On January 1, 1909, our cash surplus was.....	$920,475.16
Increase	$402,510.34
1909 dividends	$1,500,000
1908	840,000
Increase	$660,000

From this statement it will be noted that although dividends during the past year have been almost doubled, the cash surplus has been increased more than $400,000. The general manager reports that the ore reserves are greater to-day than at any period in the company's history

---

STATISTICS AND RETURNS

SOUTH AFRICA.

Johannesburg.—The dividends declared by Rand gold mining companies for 1909 total £9,217,071.

Transvaal gold mines outside the Rand have declared £184,298.

AUSTRALIA.

Sydney, Jan. 4.—Leave has been granted by the courts for the prosecution, under the amended Industrial Disputes Act, of four union officials, including Mr. Bowling, the president of the Miners' Federation.

OPERATIONS OF THE ROYAL MINT IN 1909.

The Deputy Master of the Royal Mint has issued the following summary of the operations of the Mint during the past year compared with 1908:—

IMPERIAL COIN ISSUED AND WITHDRAWN.

GOLD.

Totals	126,483,042			113,139,490

The operations of the Dominion Steel Company for the year just closed were affected adversely by the disturbance in supply of coal through the strike at the Dominion Coal Company's collieries.

The company suffered from an actual shortage in quantity, which could not be promply made good by purchases elsewhere, and also from the variation in the quality of coal brought from other sources.

Notwithstanding this the production of steel was considerably increased, and the other figures make a satisfactory showing. The production in 1904 and 1908 respectively were as follows:

	1909. Tons.	1908. Tons
Coke	401,182	411,086
Pig Iron	256,496	262,839
Steel ingots	296,950	279,513
Blooms	262,052	248,621
Rails	140,738	152,440
Wire rods	73,004	40,420

The receipts of iron ore, and the shipments of iron and steel were as follows:

Ore from Wabana	530,682	556,255
Ore from other sources	14,765	44,212
Shipments	267,286	246,041

Considerable progress has been made in the work of enlarging the plant. The new coke ovens are well under way. Contracts have been let for the new blast furnace, the additions to the open-hearth, and for most of the other additions proposed. By next autumn the capacity of the plant will have been very greatly increased.

Kalso Shipments During December.

The ore shipments through Kaslo for the month of December totalled 1,160 tons, of which 620 were silver-lead and 540 zinc, The latter class of ore was shipped exclusively by Lucky Jim with 320 tons and the Whitewater 220. In addition the Whitewater and the Deep under the same management, shipped 420 tons of silver-lead or about two-thirds of the entire tonnage of that class of ore. The December tonnage puts the total output of the Kaslo-Slocan mines for 1909 up to 19,852 tons of silver-lead and zinc ores.

Three new properties appear in the shipping list, namely, the Utica at Sproules, the Gold Cure up South Fork and the Ohio at Whitewater. Nine properties shipped the last month of the year, they and their tonnage being as follows:—

Mine	Tons.
Silver-Lead.	
Rambler	60
Utica	40
Cork	20
Flint	20
Gold Cure	20
Ohio	20
Whitewater Deep	240
Whitewater	180
Zinc.	
Lucky Jim	340
Whitewater	220
Total	1,160

The output for 1909 totalled 19,852 tons of silver-lead and zinc.

B. C. ORE SHIPMENTS.

Nelson, Jan. 8.—Following are the details of the ore shipments for the first week of the new year:

Boundary	
Granby	26,034
Mother Lode	9,250
Ore Denoro	370
Snowshoe	4,196
Total	39,850
Rossland.	
Centre Star	4,602
Le Roi	393
Le Roi No. 2	711
Total	5,706
Slocan-Kootenay.	
St. Eugene	340
Broadview	31
Silver Cup	76
Arlington	20
Richmond-Eureka	67
Standard	68
North Star	87
Whitewater	78
Blue Bell	110
Van Roi	47
Total	924
Grand Total	46,560

The smelter receipts follow:

Granby, Grand Forks	26,034
Consolidated Co., Trail	10,906
B. C. Copper Co., Greenwood	9,620
Total	46,560

B. C. ORE SHIPMENTS.

Nelson, January 15.—The ore shipments and smelter receipts in detail are as follows:

ORE SHIPMENTS.

Boundary

	Week.	Year.
Granby	26,572	52,606
Mother Lode	9,875	19,125
Oro Denoro	350	720
Snowshoe	1,432	5,708
Total	38,229	78,159

Rossland.

	Week.	Year.
Centre Star	3,199	7,801
Le Roi No. 2	152	863
Velvet	69	69
Other Mines		393
Total	3,420	9,126

Slocan-Kootenay.

St. Eugene	398	738
Richmond-Eureka	187	254
North Star	40	127

Ferguson	31	31
Yankee Girl	87	87
Nugget	32	32
Granite Poorman	33	33
Eastmount	32	32
Other mines		242
Total	1,178	2,102
Grand Total	42,827	89,387

SMELTER RECEIPTS.

	Week	Year.
Granby	26,572	52,606
Consolidated Co.	6,156	17,062
B. C. Copper	10,225	19,845
Total	42,953	89,513

The Transvaal gold output for December showed an increase in value of £30,676, but the daily average production was lower. The gold output for the year was a record. Native labour showed a gain of 4,674 "boys" for the month.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending January 21, and those from January 1, 1910, to date:—

	Jan. 21. Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo	47,644	112,144
City of Cobalt	.....	64,000
Cobalt Central	.....	40,000
Cobalt Lake	132,000	132,000
Coniagas	.....	119,542
Crown Reserve	123,353	245,785
Drummond	264,200	664,200
Kerr Lake	182,392	302,605
King Edward	49,952	49,952
La Rose	256,059	577,031
McKinley-Darragh	50,329	98,370
Nipissing	302,939	365,240
O'Brien	64,056	64,056
Right of Way	64,902	127,963
Temiskaming	60,000	60,000

Ore shipments for week ending January 21 were 1,597,826 pounds, or 798 tons. Total shipments from January 1 to January 21 were 3,022,888 pounds, or 1,511 tons.

Spelter, 6½ cents per lb.
Lead, 3.75 cents per lb. (very strong).
Antimony, 8¼ to 9 cents per lb.
Tin, 35¾ cents per lb.
Copper, casting, 14¼ cents per lb.
Electrolytic, 14¼ cents per lb.
Ingot brass, 9 to 12 cents per lb.

Jan. 24.—Pig Iron—(Quotations from Drummond, McCall Co.)
Summerlee, No. 1, $23.50 (f.o.b. Toronto).
Summerlee, No. 2, $23.00 (f.o.b. Toronto).
Midland, No. 1, $22.50 (f.o.b. Toronto).
Coal—Anthracite, $5.50 to $6.75.
Bituminous, $3.50 to $4.50 for 1¼-inch lump.

Coke.

Jan. 20.—Connellsville coke (f.o.b. ovens).
Furnace coke, prompt, $2.60 per ton.
Foundry coke, prompt, $3.00 per ton.

Jan. 20.—Tin (Straits), 32.45 cents.
Copper, prime Lake, 13.95 cents.
Electrolytic copper, 13.62½ cents.
Copper wire, 15.25 cents.
Lead, 4.70 to 4.75 cents.
Spelter, 6.25 cents.
Sheet zinc, 8.50 cents.
Antimony, Cookson's, 8.50 cents.
Aluminium, 21.75 to 23.00 cents.
Nickel, 40.00 to 49.00 cents.
Platinum (hard), $34.50 per oz.
Platinum (ordinary), $29.00 per oz.
Bismuth, $1.75 per lb.
Quicksilver, $51.00 to $51.50 per 75-lb. flask.

GOLDORA MINES LIMITED
Suite 1608 - 80 King Street, West,
Toronto (1) , Ontario

PROGRESS REPORT:

Goldora Mines reports that Hole No. 2, driven to cut a magnetometer anomaly along the sedimentary-lava contact on the Westerly projection of the Obaska Mines orebody, was terminated at 500 feet. Considerable delay was caused by caving which necessitated cementing the hole on three occasions. Core returns showed abundant quartz and carbonate veinlets, considerable pyrite mineralization, some chalcopyrite and lastly, a fine grained andesite similar in appearance to the one in which the ore occurs at Obaska Mines.

Drilling of Hole No. 3 , sited 700 feet West of No. 2 with design to cross-section the same contact and general conditions associated with the latter, is in progress.

August 16, 1944

ANNOUNCEMENT

IN PRESS—WILL BE ON SALE EARLY IN FEBRUARY.

THE HANDBOOK OF THE COBALT DISTRICT

Including a Manual of Incorporated Companies.

By H. P. DAVIS.

¶ The first section of this volume is a treatise on the Geology, Mining Treatment and Marketing of the Ores of the Cobalt District, the object being to give all the data and general information necessary to guide investors, brokers and professional men generally.

¶ Included in this volume is a complete and accurate directory of all mining companies operating or organized to operate in the Cobalt Silver District of Ontario.

¶ Full information as to capitalization, directorates, locations and conditions of properties is given. Tabulated statements of production and dividends revised up to January, 1910, are included.

PRICE $1.50 paper Cover. - - $2.00 Stiff Cover.

BOOK DEPARTMENT

CANADIAN MINING JOURNAL

TORONTO

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

A CROWN MINERAL PROPERTY

Suppose the Government should say to you there is a property worth $10,000. We will sell it to you for $10,000, payable in 20 annual instalments and won't charge interest on deferred payments. In event of your death at any time during the 20 years, we guarantee to cancel the balance due and execute a warranty deed to your wife, or if she prefers, we will pay her $10,000 in cash. If you live to complete all payments, we will pay you $10,000 cash, plus interest earned on your annual deposits. Chances are you would jump at it. We are making just such an offer backed by assets of over $45,000,000. Better investigate it.

Second Edition With New Material

Simple Mine Accounting

By David Wallace

78 pages, 6x9, with forms. $1.00 (4/6) net postpaid.

Some very good material has been added to this excellent little book. It has some new sections on card systems for warehouses, shipping documents, sheets of costs and profits, etc., etc.

From the first publication the book has proved most useful to every Superintendent or Mine Manager who wasn't an expert accountant and whose business wouldn't warrant employing one.

It is essentially *simple*. It shows how to develop the ordinary books and systems of a small mine (or a large one) so as to preclude the slipshod, inaccurate methods which are so expensive to every business. It isn't an expert accountant's book, but it shows how to keep records that are accurate and tell the real facts.

CANADA.—DEPARTMENT OF MINES.

GEOLOGICAL SURVEY

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

MARITIME PROVINCES

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

QUEBEC

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

ONTARIO

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

THE NORTH WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.

THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

CANADA

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet.
1025. Waverley Sheet.
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

ONTARIO

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

YUKON

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

REPORTS

1072. Summary Report of the operations of the Geological Survey for year 1908.
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.
1075. Gowganda Mining Division, 1908. W. H. Collins.
1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

The Crow's Nest Pass Coal Co.

LIMITED

OFFICES

Manning Arcade, Toronto
Fernie, British Columbia

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905. Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

CHAS. SIMISTER, General Superintendent.

J. D. HURD, General Manager.

WHY IS IT

THAT SALES OF

MORTON'S "BC"

Drill Steel

ARE INCREASING EVERY DAY?
MUST BE IT IS BETTER MATERIAL,

Gives Best Satisfaction

AND THE DRILL

Lasts Longer.

COULD ANYONE EXPECT MORE?

GRAND TRUNK RAILWAY SYSTEM

The Longest Continuous Double Track Railway in the World Under One Management.

The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

The "International Limited" (Canada's Railway Greyhound)

The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT TORONTO KENORA WINNIPEG, MAN.

BUY YOUR OUTFIT AT SIMPSON'S

We'll supply you with an outfit complete from tent to pick-hammer.

We'll pick out a prospector's outfit for travelling light or an outfit for developement work at a stationary camp. Don't overload yourself. We can help you choose what you really need and we can do it at a minimum expense.

THE SIMPSON MINER'S KHAKI DUCK SHIRTS.

A Shirt with "no end of wear." A Shirt made of the strongest khaki duck—in the strongest kind of way—by men who are highly experienced in miners', surveyors' and prospectors' outfits. Buying these shirts in very large quantities, we are able to offer you a shirt worth in every way $1.50 for - **One Dollar per Shirt.**

Miners', surveyors' and prospectors' shirts, heavy khaki duck collar, two pockets with buttoned flaps, dome fasteners, sizes 14 to 18. Our special value at **$1.00**.

OUR SPECIAL UNDERWEAR FOR MINERS.

We recommend heavy pure wool, the kind that feels warm and is warm, all the time, whether wet with perspiration or not. Try our heavy all wool with just a little camel's hair mixed with it—making a very soft garment next the skin, and giving "the highest degree imaginable," of cold weather protection and comfort. This underwear we specialize at - - - - **One Dollar per Garment.**

SIZES 34 to 48.

OUR SPECIAL TARTAN FLANNEL SHIRTS.

The cashmere flannel in these garments can only be made in Glasgow, Scotland. We import it in large quantities and have it made by skilled workmen into shirts to our own specifications, making the price of the very best quality only **$3.00 per shirt.**

Men's, all wool, cashmere, flannel, tartan, shirts, made with reversible collars, and pockets, genuine fabric, best tailoring, they fit perfectly in every way. Our Special Price is - - - - - - - **$3.00.**

Rock Drilling Efficiency

Sullivan "UE11" (Tappet Valve) Drill in a soft iron-ore mine in Northern Michigan.

is measured by air consumption plus wear and tear, plus labor, divided by the footage drilled.

If you will keep a record of these items from month to month, or year to year, you will find that your Sullivan Drills are drilling more feet, at a lower cost per foot, that is, are more efficient than any other drills working under the same conditions.

Try it. If you have no Sullivan Drills at your mine, let us send you one.

An Important Trio

Economics **Principles** **Methods**

Within a few months three highly important mining books have appeared, covering the practical, the fundamental and the economic phases. They are valuable books by thoroughly sound men of established reputations.

The Cost of Mining

By JAMES R. FINLAY

415 pages, 6x9, illustrated

$5.00 (21s.), net, postpaid

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover costs of mining **coal, iron, lead, zinc, copper, gold** and **silver.**

Contents: Value of Mining Property, Factors Governing Variations, Partial and Complete Costs. Statistics of Coal Production. Costs of Mining Coal. Cost of Mining Lake Superior Iron. Occurrence and Production of Copper. Lake Superior Amygdaloid Copper Mines. Conglomerate Copper Mines of Lake Superior. Copper Mines on Fissure Veins in Montana, Australia and Arizona. Various Copper Mines of Arizona and Mexico. Copper Mines in various other Districts. The Copper Mining Business in General. Lead. Silver-Lead Mining. The Cost of Silver-Lead Smelting. Zinc Mining. Occurrence and Production of Gold. Quartz-Pyrite Gold Mines. Cripple Creek. Kalgoorlie and Goldfield. Silver Mining at Cobalt and Guanajuato.

Principles of Mining

By H. C. HOOVER

200 pages, 6x9, illustrated

$2.50 (10/6), net, postpaid

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Part I deals fully with the determination of value, prospective and in sight—the sizing up of the mine—and in this Mr. Hoover's work has been extensive and highly successful.

Part II discusses the development of tunnels, shafts, crosscuts, etc., with chapters on mechanical equipment and efficiency.

Part III. Administration of mines with all the problems of labor efficiency, labor unions, wages, working costs, accounts, division of expenditure, etc.

The main chapter headings are: Valuation of Copper, Gold, Lead, Silver, Tin and Zinc Lode Mines. Mine Valuation. Development of Mines. Stoping. Methods of Supporting Excavation. Mechanical Equipment. Ratio of Output to the Mine. Administration. The Amount of Risk in Mining Investments.

Timbering and Mining

By W. H. STORMS

300 pages, 6x9, fully illustrated

$2.00 (8/6), net, postpaid

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Contents: Introduction. Timber Used in Mining. Preservation of Timbers. Drifting and Drift Sets. Driving Lagging in Drifting. Driving in Running Ground. Breast Boards. Structural Steel in Mine Workings. Timbering Drift Gravel Mines in California. Shafts. Location, Kind and Size of Shafts. Prospecting Shafts in Good Ground, and Those Requiring Close Timbering. Cribs and Single Compartment Shafts. Size and Division of Working Shafts. Drainage. Position of Temporary Hoisting Plant and Permanent Plant. Size of Shaft Compartments. The Collar. Hanging Belts. Cross Head in Sinking Shafts with a Bucket. Stull Methods in Many Small Mines of the Cobalt District, Ontario. Bucket Dumping at Vertical Shafts. Bucket Dumping at Inclined Shafts. Framing Shaft Timbers. Butt Corner and Dove-Tail Corner Methods. Framing for Vertical Shafts. Divider and Spliced Wall Plate. The Template. Placing Timbers of Shaft Sets in Position. Placing Timbers in Inclined Shafts. Lining the Sets. Difficulties in Sinking Through Running Ground. Sinking Through Running or Loose Ground. Combination Vertical and Inclined Shafts. Bearers in Shafts. Fenders for Protection of Shaft Timbers When Blasting. The Cable Mat. Extension Tracks for Sinking. Inverted Rails. Sinking Ladders.

We can supply any engineering book in print.

MR. CLIFFORD SIFTON AND NATURAL RESOURCES.

For the position of President of the Commission on the Conservation of Natural Resources, the Hon. Mr. Sifton is specially fitted. His executive ability and his business acumen have been proved and amply recognized. While his appointment as president is acceptable to Canadians, it is obvious that in labours so wide and so diversified he must have the advice of strong and disinterested specialists. This statement is borne out by the recent utterances of Mr. Sifton himself.

In his exceptionally forceful address, delivered at Ottawa on January 18th, Mr. Sifton covered a great deal of ground. He dealt with many matters of moment. With only one of these are we concerned. Mr. Sifton made certain specific references to mining and minerals. Several of these are absolutely incorrect, one or two are absurdly wrong, and others are tinctured with error.

Before discussing these in detail, it is well to state that we are perfectly in accord with the spirit that pervades Mr. Sifton's address. It is obvious, however, that in facts and figures relating to mining some one has been leading him very much astray. For various good reasons, including strong internal evidence, we believe that Dr. Haanel is responsible. As a former protege, and as a present friend of Mr. Sifton, Dr. Haanel has been permitted to retain a position that he cannot fill. His past and present relations to Mr. Sifton warrant a strong assumption that it was he who supplied the "dope." In any case, Mr. Sifton should be long in forgiving the fatuous offender who put him so much off the track.

We shall now proceed to quote: "In the Cobalt camp," says Mr. Sifton, "the mine owners are largely at the mercy of foreign smelters and refiners. Much valuable mineral . . . is lost to the owners and to this country because there is no effective method of treating these ores in Canada. Thorough investigation by experts is highly necessary. Probably the valuable mineral lost in the Cobalt camp in one year would pay for the whole investigation and build the plant necessary to treat the ores under proper guarantees."

This is awful. Look at the facts—and how shall we excuse Dr. Haanel for blinking them! The Ontario plants at Copper Cliff, Thorold, and Deloro can treat all the high-grade ore produced at Cobalt. Moreover, as these plants purchase by far the greater part of the high-grade ore of the camp, it is self-evident that they can treat that ore more economically than can foreign plants. Therefore, also, the Ontario plants pay higher prices.

Further, the ores mined at Cobalt are singularly complex. It is not to be expected, at the present stage of metallurgical knowledge, that all the constituents can be refined commercially at once. And where, in heaven's name, could they be marketed after refining! Silver and arsenic are now extracted. The residues, containing cobalt and nickel, are held for further treatment. Cobalt oxide can be turned out to meet all present demands. All the Canadian refineries seem satisfied with their processes. Their owners have secured, and paid for, the best technical assistance. A government experimental plant, such as Mr. Sifton suggests, could not secure as highly qualified men, simply because no government will pay such high salaries as do private companies. A government that will let a corporation outbid it for the services of Mr. M. J. Butler cannot be expected to compete successfully for the services of expert metallurgists, men who belong to a profession in which high salaries are demanded as a matter of course. On the other hand, a government plant, under the management of the Mines Branch as at present constituted would be an unmitigated farce.

Mr. Sifton, in his reference to mine accidents, has been again misinformed. It is not true that "Canada makes almost the worst showing in the world." As we have repeatedly pointed out, the coal mines of Nova Scotia are among the best regulated anywhere. Our Western coal mines show lower death rates per thousand men employed than do the majority of United States collieries. The death rate, due to accidents, at Cobalt in 1908 was not "24.8 per 1,000 employees working underground," but only about one-quarter of that rate. Moreover, to compare the 250 scattered mines and prospects of Ontario, with the large highly developed mines of the Transvaal, is patently unfair. It is fair, however, to institute such a comparison between these latter mines and the Copper Cliff mines. In this case we find that the fatality at Copper Cliff is, roughly, about half that obtaining in the Transvaal mines. Obviously the better record at Copper Cliff, as compared with Cobalt, is due to the concentration of attention to a few large workings.

In his statement that in electric smelting, "we have led the way in investigations," Mr. Sifton will find remarkably little support. The experiments in producing pig iron at Sault Ste Marie, were made under the direction of a French inventor, brought to Canada for the purpose. Just how far Dr. Haanel wished to advance the cause of science, and just how far the experiments were designed to exploit a private patent, we can only guess. But the actual truth (and it is high time that some one should tell it) is that economic results were not obtained at the Sault. In fact, about all that has been done in Canada is to describe the work of others. Our much heralded production of pig iron in the electric furnace has failed absolutely to materialize.

But enough of correction. We are sincerely glad that Mr. Sifton is to devote his unquestioned talents to national economies. If we have spoken very plainly, it is entirely because we think that the time for talking official balderdash about mining has passed. Mr. Sifton can conserve our mineral resources and our patience best by reorganizing the department that he himself created. Meanwhile, we wish him all success.

ENGINEERS AND INSTITUTES.

Mr. A. B. Willmott contributes to our columns a profitable discussion of Mr. Kendall's paper on "Mining Engineers and Mining Institutes," It will be noticed that Mr. Willmott opposes strongly any radical restriction of the membership of the Canadian Mining Institute. Mr. Willmott points out that the Institute, as at present constituted, "is a wide-open congress . . . where all interested in mining, whether technically qualified or not, can meet and discuss matters of common interest. . . . Let us move slowly in the matter of change. . . . We want the broker and investor to attend our meetings and learn the views of our leaders on the ethics of mine finance and on the duties of directors to their shareholders."

To conserve professional standards Mr. Willmott suggests the formation of a Mining Engineers' Guild, to be composed of members of the Canadian Mining Institute, possessing certain qualifications.

The scheme outlined by Mr. Willmott will probably meet with both approval and censure. We are of the opinion that it is essentially sound and practicable. But there are many points that require the fullest discussion. And we hope that our readers will not be backward in expressing their views. We hope, also, that the whole matter will be thoroughly threshed out at the annual meeting of the Canadian Mining Institute.

THE PORTLAND CANAL MINING COMPANY.

Interest in the Portland Canal mining district is growing . The fact that Messrs. McKenzie and Mann, have acquired large holdings has given advertisement to the region. As usual, however, United States capitalists have been most energetic. But many British Columbia investors have sent, and are sending men north to stake properties.

One company, the Portland Canal Mining Company, Limited, with headquarters at Duncan, B.C., has issued its second annual report. From this report we learn that $100,000, raised by the sale of a block of treasury stock, is being expended in erecting a 100-ton concentrator, an aerial tramway, and a water-power plant.

Three tunnels have been driven into the mountain side, aggregating a total footage of about 600 feet. Tunnels No. 1 and No. 2 are reported to be in rich ore. Tunnel No. 3, cuts a downward continuation of the ore body disclosed above. The ore carries from $10 to $30 in gold, and about $45 in silver per ton. In thickness the vein apparently exceeds 13 feet. The ore contains galena, argentite, and native silver.

From all that can be learned at present, the Portland Canal region affords one of the best opportunities known in Canada for profitable mining.

THE TYEE COPPER COMPANY, LIMITED,—A CORRECTION.

We greatly regret that there appeared in our issue of January 1st, 1910, in the review of mining in the province of British Columbia in 1908, by Mr. George A. Ohren, a statement that "the Tyee Copper Company is reported in considerable debt."

The facts, as stated officially, are that this company, in addition to the large value of its properties, smelting plant, and stores, has available a cash reserve fund invested in Trustees' Stocks, of about $350,000 and its financial status is so well known that its credit has never been questioned.

We deeply regret this statement, which was obviously based on misleading information, and we take the first opportunity of making this correction.

The good name of the Tyee Company throughout the Western country for prompt payment, and for honourable treatment of all parcels of ore sent to their customs smelting works, is so well and favourably known, that we trust the inaccuracy of our inadvertent statement did not cause a moment's embarrassment.

THE COST OF LIVING.

The Wall Street Journal, in an exceedingly sane and timely editorial, alludes to the "growing division of labour and specialization of functions," as a distinguishing tendency of modern commercial life. Our contemporary glances at the burden carried by each unit of population in the highly organized city of New York. According to the recent census report, the annual per capita civic expenditure for every man, woman, and child in New York, is $23.84; or practically $120 for a family of five. In addition to these astonishing figures, the per capita Federal Government expenses amount to about $8, or $40 per year for a family of five.

The Journal remarks that, while civilized nations are far from the unhappy state of Rome, which broke down largely because the burden of taxation stifled agriculture, yet conditions are becoming serious, In short, it is the object of the editorial to indicate that the multifarious and increasingly differentiated functions assumed by governments, whilst they may have a high ethical value, are uneconomic. How far they can be multiplied, is one of the questions that affects the grand problem of the cost of living.

THE DAVIS HANDBOOK OF COBALT.

Cobalt still looms large on the financial horizon. Its importance shews no sign of waning. The number of investors and others, interested directly and indirectly in the camp, is daily increasing. Meanwhile there has been created a demand for some ready and complete book of reference covering the Cobalt district.

Such a book is soon to be published. Its compiler, Mr. H. P. Davis, is one of the pioneers of Cobalt. For three years he has been collecting material. His book, "The Davis Handbook of the Cobalt Silver District," is a compendium of all information necessary to guide the investor and to instruct the general reader. Following a sketch of the geology, mining methods, ore markets, etc., come full statistical statements and an exhaustive directory of all companies operating, or incorporated to operate, in the Cobalt district.

We have no hesitation in commending the Davis Handbook. It will be found reliable, exact, and perfectly unbiased. On another page, we publish part of an advance chapter from this volume.

EDITORIAL NOTES.

It is gratifying to Canadians to learn that to Dr. A. P. Coleman, of Toronto University, has been awarded, by the Royal Geological Society, the Murchison Medal for distinguished geological investigation. The honour is well deserved.

The Le Roi Mining Company faces a net loss of $47,150 on its operations for last year. Its new exploration scheme includes about 35,000 feet of diamond drilling. Special attention is to be paid to the 1,650 foot level, where good ore was encountered last year.

The School of Mining, Kingston, Ont., is advertising for applications for the position of Assistant Professor of Geology. Applications will be received until March 15th, 1910. Particulars are set forth in our advertising section.

In the deep mines of the Rand, drill sharpening by means of electric furnaces installed underground has been introduced.

The peat electric station at Skabersjo, Sweden, which has been quietly worked more than five years, is supplied by a small bog of 37 acres, with peat averaging five feet in depth, and in this source is estimated to have fuel for about 30 years. The electric current is yielded by two generators of 150 horsepower each, which are coupled direct to two gas engines, receiving the peat gas from two Korting suction-gas producers. The current is conducted two or three miles to Svedala, and is used for lighting the streets, and for power for several small industries. The price to consumers is only about one-half cent per horsepower hour. Tar is the only by-product saved, but the experiments now in progress at different places indicate that the sulphate of ammonia and other by-products recovered in a somewhat larger station—one of a few thousand horsepower—will be so profitable that they will pay all expenses, leaving the entire power production as clear gain, or a product costing nothing.

SHEEP CREEK DISTRICT, B. C.

Written for the Canadian Mining Journal by A. H. Gracey.*

The gold camp known as Sheep Creek, is situated about 25 miles south-east of Nelson, B.C. The nearest railroad point is Salmo, a town on the Nelson-Spokane branch of the Great Northern R. R., 25 miles south of Nelson.

Gold mining in the district was first undertaken about thirteen years ago, when a ten stamp mill was installed at the Yellowstone mine, but about a year later the property was closed down. An adjoining property to the Yellowstone is the Queen group, which at that time was but a prospect. Several leases were afterwards taken on the Queen by different parties, and besides several shipments of crude ore to the smelter, considerable milling ore was treated in the Yellowstone mill, rented for that purpose. It is understood that these leases were financially successful but the development of the mine was not extensively pushed. Wm. Waldie, one of the owners, then took hold with such success that later on he was able to purchase the interests of his partners and also the Yellowstone mine and mill. From this time on the Queen was quietly and successfully operated by Mr. Waldie, until in the spring of 1908 he sold out to an American syndicate for $175,000.

For three or four years previous to this sale different leases had been taken on other near by properties, chief among which were the Mother Lode and Kootenay Belle. Although the results were usually encouraging, to the extent of making small shipments of high grade ore, development was not undertaken and the leases lapsed with little accomplished.

In the fall of 1907 a prospect then little known, was taken up under lease and bond, by Mr. W. B. Pool and a partner. This was the now well known Nugget mine. During the following winter, as the result of less than 150 feet of development, Mr. Pool was able to ship to the smelter 190 tons of sorted ore, (taken practically from development faces only), which gave gross smelter returns averaging over $100 per ton. This achievement attracted real notice to the camp. Up to date, with comparatively little development, properties within a radius of three miles have produced approximately $1,000,000 in gold.

Mr. R. W. Brock of the Dominion Geological Survey, in his summary report of 1908, thus describes the geology of the camp: "The veins being worked at present occur in a band of quartzites, slates and schists, which extend northward from about Lost Mountains across Sheep Creek and Wolf Creek, and up the ridge between Sheep and Fawn Creeks. To the west is a wide band of crystalline limestone. Some granitic and aplitic dikes are intruded into the formation, and also some basic mica dikes. The general strike of the rocks is about N. 12 degrees E. with a dip of 50 degrees to the east. The veins are fissure veins cutting the formation, usually the quartzite."

During the seasons of 1908 and 1909 considerable progress has been made in both development and production. The Queen mill has been enlarged to 20 stamps, a new hoist and compressor installed and deep development undertaken. This latter is interesting for the reason that the Queen is the lowest property in altitude in the camp. The present lower workings are from 200 to 300 feet below the bed of Sheep Creek, where the vein maintains its size and values. The milling ore, stoped to widths of from 6 to 12 feet, has averaged $15.00 per ton. This persistency in depth, is an encouraging feature in considering the camp's future. Ore from these lower workings carries a high percentage of sulphides, principally iron pyrites, but the percentage of recovery by amalgamation remains satisfactory and the concentrates, from Wilfley and Overstrom tables, amounting to about 7% of the ore milled, are shipped to the smelter.

In the spring of 1908 the one half interest of Mr. Pool's partner in the Nugget bond was purchased by A. H. Gracey and associates of Nelson, and the Nugget Gold Mines, Limited was organized. A four stamp mill, with Frue vanners, was installed and started crushing ore November 1st, 1908. This is a temporary plant for use during the preliminary development stage. Since its installation it has been in continuous operation and up to the end of 1909 approximately 6,150 tons have been treated, averaging in bullion recovery by amalgamation $15.00 per ton. The concentrates amounting to from 2 to 3% of the ore milled, average $90.00 per ton. In addition to ore milled and concentrates shipped, and also in addition to the 190 tons previously shipped, 350 tons of crude ore shipped since the mill started averaged $115.00 per ton.

The total underground development, the deepest being 350 feet below the surface, amounted to 1,750 feet at the end of 1909. One ore shoot has been proved for a length of 400 feet and the stoping width varies from 4 to 10 and 12 feet. The average value of the ore has been $28.00 per ton.

The Mother Lode Group adjoins the Nugget on the south. It was bonded from the owners in the spring of 1908 by J. L. Warner, of New York, who operated it during the following season, shipping considerable crude ore to the smelter, averaging as high as $145.00 per ton. In February 1909 he sold his interests to Mr. John McMartin of Ontario, and under Mr. W. Watson, of New York, as consulting engineer, development has been vigorously pushed with very encouraging results. The deepest workings in the third level, prove the existence of extensive high grade ore shoots. From surface work various former leasers shipped over $50,000 worth of ore.

It is the intention of the present owner to install a large treatment plant in the near future.

The Kootenay Belle Group, lying across Sheep Creek from the Mother Lode, has produced over $100,000 under lease. It was also bonded by Mr. Warner at the time he acquired the Mother Lode. A four stamp mill was rented, and 1,300 tons of second class ore treated averaged in bullion recovery by amalgamation $14.80 per ton. Crude ore shipped averaged $70.00 per ton. It is understood that the property has recently changed hands and extensive development will be undertaken.

Adjoining the Nugget on the north, is the Golden Fawn Group, and while as yet in the prospect stage, the surface croppings of a large vein are very promising.

The Searchlight Group adjoins the Nugget on the east and lies in the strike of the Nugget veins. The group was bonded last fall by the Sheep Creek Development Syndicate, of Nelson. Surface croppings of good ore have been found which are probably extensions of the Nugget veins and during the coming season will be systematically developed.

*Manager Nugget Gold Mines, Ltd., Sheep Creek, B.C.

Last summer a good vein of high grade ore was found on the Clyde-Belt, a property adjoining the Mother Lode on the south-west, and shipments are now being made to the smelter. All indications point to the development of a valuable property. An extensive group adjoining the Mother Lode on the south, is known as the Golden Belle, and while little development has been done, two or three veins are reported which will be explored this season by a Vancouver syndicate, to whom the property was recently sold.

The Bonanza Group, consisting of five full claims lies just south of the Queen. Last summer the owners found and traced on the surface for 1,200 feet, a vein which is now being developed under a bond held by a company known as the Sheep Creek Bonanza Mining Co., of Vancouver. A substantial cash payment has been made and the company is now shipping sorted ore. The indications are that this property will develop satisfactorily with milling ore, averaging from $10.00 to $25.00 per ton. It is the intention to install a stamp mill next fall.

The Vancouver Group adjoining the Kootenay Belle, on the south, has lately joined the shipping list with ore averaging $98.00 per ton.

Lying south of the Queen is the Ore Hill Group. Several veins are more or less developed, and a small mill was installed some time ago which was destroyed by fire and since that time little active work has been done.

The most southerly property which has so far been operated is called the Summit Group. The contact between the quartzite and limestone belts passes through the group, and accompanying this contact is a mineralized zone containing, as exposed by surface cuts, large lenses of ore carrying considerable galena, iron pyrites and zinc blende. The chief value contained is, however, gold and average samples assay from $10.00 to $45.00 per ton. No underground development has been done in this contact vein.

In the limestone three or four small fissures have been found which intersect the contact vein and from them, at some distance from the contact, several shipments have been made which averaged from $200.00 to $450.00 per ton. This property has also been bonded by Vancouver people who are now developing and shipping ore.

Over 25 strong and permanent looking fissures have so far been discovered in the above mentioned properties. They are all approximately parallel in strike and occur within a radius of 3 1-2 miles. There are, of course, many other claims and groups less known, located on veins, some of which may prove valuable.

The developed milling ore of the camp averages from $15.00 to $30.00 per ton, and the more extensively developed veins have steadily improved in depth. Experiments have shown that with the cyanide treatment in addition to the present simple methods of amalgamation and concentration, a total extraction of 95% of all values may be expected, and no doubt within the next two years several large reduction plants will be in operation.

Up to the present time the camp has the unusual record of having practically from its own production developed and equipped itself, but outside capital is now seeking investment and the prediction frequently made by those well qualified to judge, that Sheep Creek will prove a very important lode gold camp, seems justified.

EXCHANGES.

The Engineering Magazine, January, 1910.—"Concentration of Magnetic Iron Ores" is the title of an interesting paper by N. V. Hansell, a writer well known to Canadians. Mr. Hansell's article sketches the development of magnetic concentration, and gives practical instances. One plant, now being built at Syd Varanger, Norway, contains 12 parallel grondal units, and will have a rated capacity of 3,600 tons per 24 hours. 1,500 tons of concentrates will be obtained daily. From an ore containing only 34 per cent. of iron, a concentrate running as high as 69 per cent. will be produced. The total product will be exported to German iron works.

The Mining Journal, January 15, 1910.—Mr. W. H. Cutten, himself interested in the manufacture of dredges continues in this issue of the **Mining Journal**, a heated discussion of the relative merits of American and New Zealand dredging practice. In the course of his communication, Mr. Cutten challenges any reader to mention a single instance in either Russia, Africa, or South America where an American dredge is paying its way, "For although" says he, "I can hear of many failures, so far I have not heard of any success."

The Labour Gazette, January, 1910.—The Labour Gazette is the official organ of the Federal Department of Labour. It will, hereafter, be noticed regularly in this column.—We note that in the fatal accidents reported for the whole Dominion for December, 1909, mining comes sixth in the list of industries and trades. For agriculture, 28 fatalities are recorded; for navigation, 24; metal trades, 16; railway service, 14; lumbering, 12; and mining, 11.

The Quarry, January, 1910.—Attention is drawn editorially to the fact that Great Britain imports annually, ordinary rock products, such as cement, slate, sand, glass, earthenware, etc., to the value of nearly seven million sterling. The total value of the yearly output of these materials in the United Kingdom is approximately equal to the value of the imports. **The Quarry** raises the very pertinent question as to whether tariff reform would not double the home output.

HOURS OF WORK IN BELGIAN COAL MINES.

The hours of work in the coal mines of Belgium are restricted to nine a day by the new law recently passed by the Belgian Senate. It is only in the large mines that mechanical appliances are used underground, and the new law will either shut many of these down or compel them to adopt these appliances; or it may be they will be absorbed by the larger companies. But the undulating character of the coal seams in many of the mines makes it difficult to use coal-cutting machines, so that the result of the new law with nine hours' work from bank to bank must restrict the coal output.

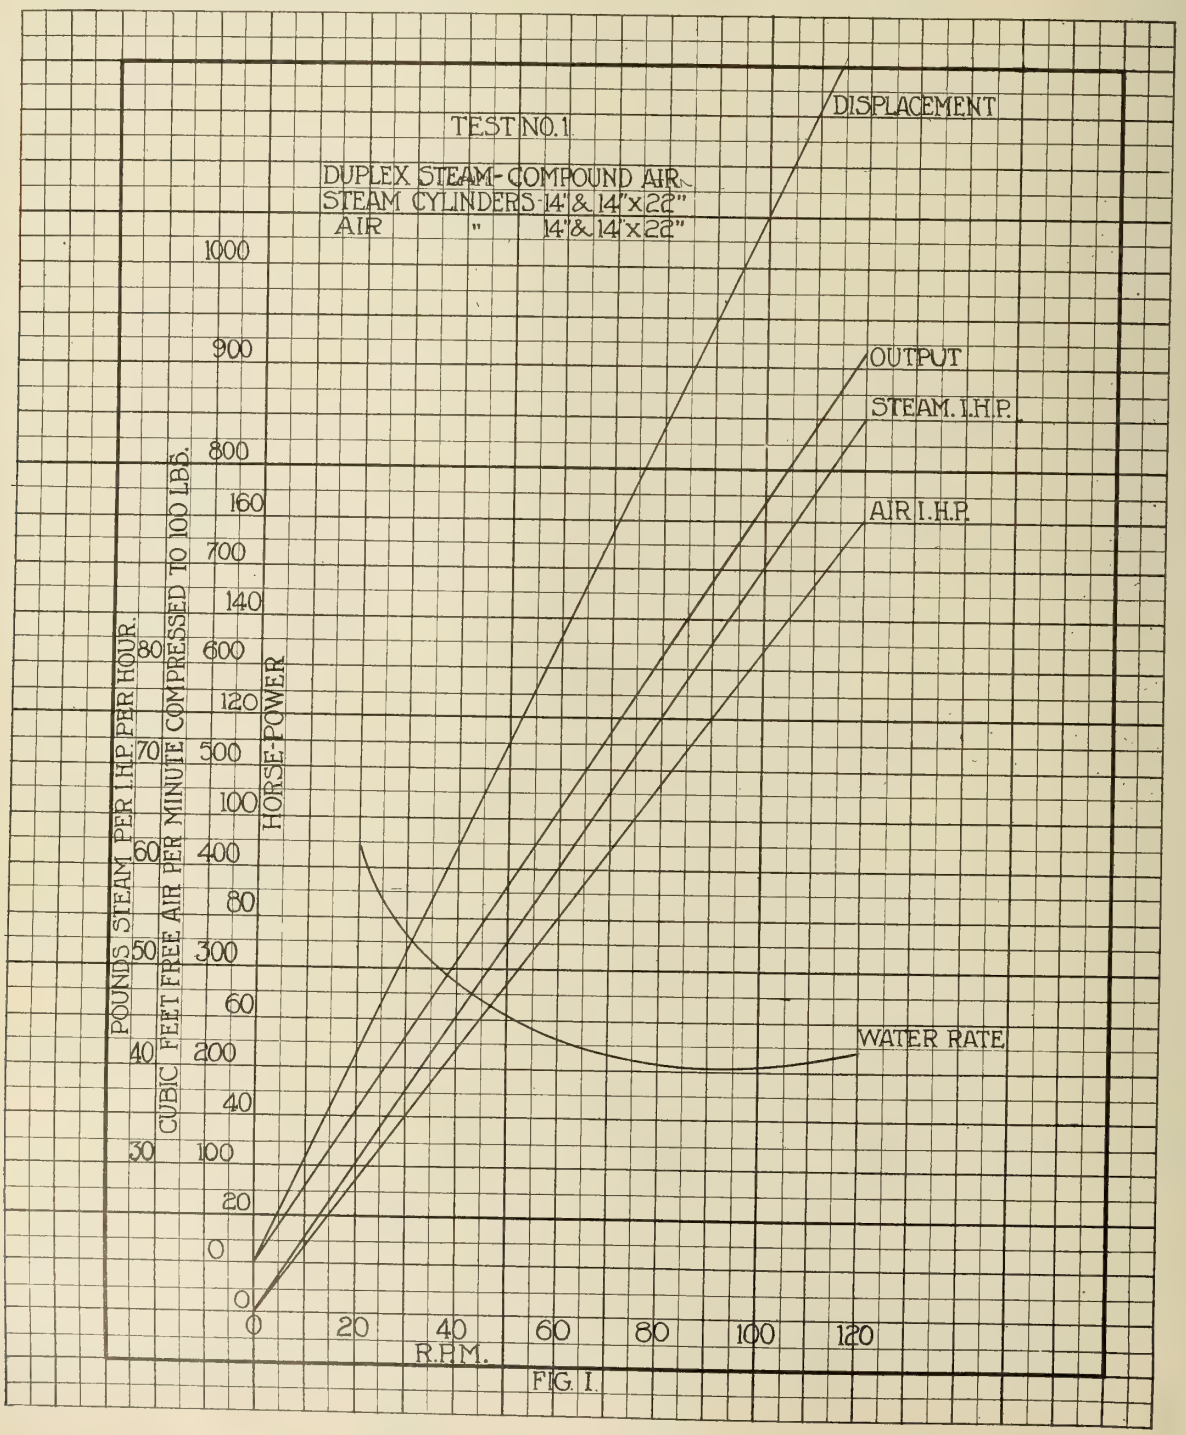
The Department of Mines of British Columbia is sending out to all interested persons a notice directing attention to the following amendment to the Mineral Act, which comes into force on April 1st: "The owner or agent of the owner of a mineral claim for which the mining recorder's certificate, under form 1 of the schedule of this Act, has been granted, shall within three months from the date of such certificate, make application to the Gold Commissioner for a certificate of improvement, and in default of such application being made within such time, such mining recorder's under form 1 shall lapse and become absolutely void."

COSTS OF PRODUCING COMPRESSED AIR IN A CANADIAN MINING CAMP.

Written for the Canadian Mining Journal by Richard L. Webb.

Copyright Pending.

Surprising as it may seem, no data have been published about the effective horsepower of air compressors. Heretofore, it has been customary to divide the indicated horsepower of the steam cylinders by the indicated horsepower of the air cylinders as determined by indicator cards, the difference being the friction of the machine. In other words, the manufacturer of air compressors has rated his machine by its



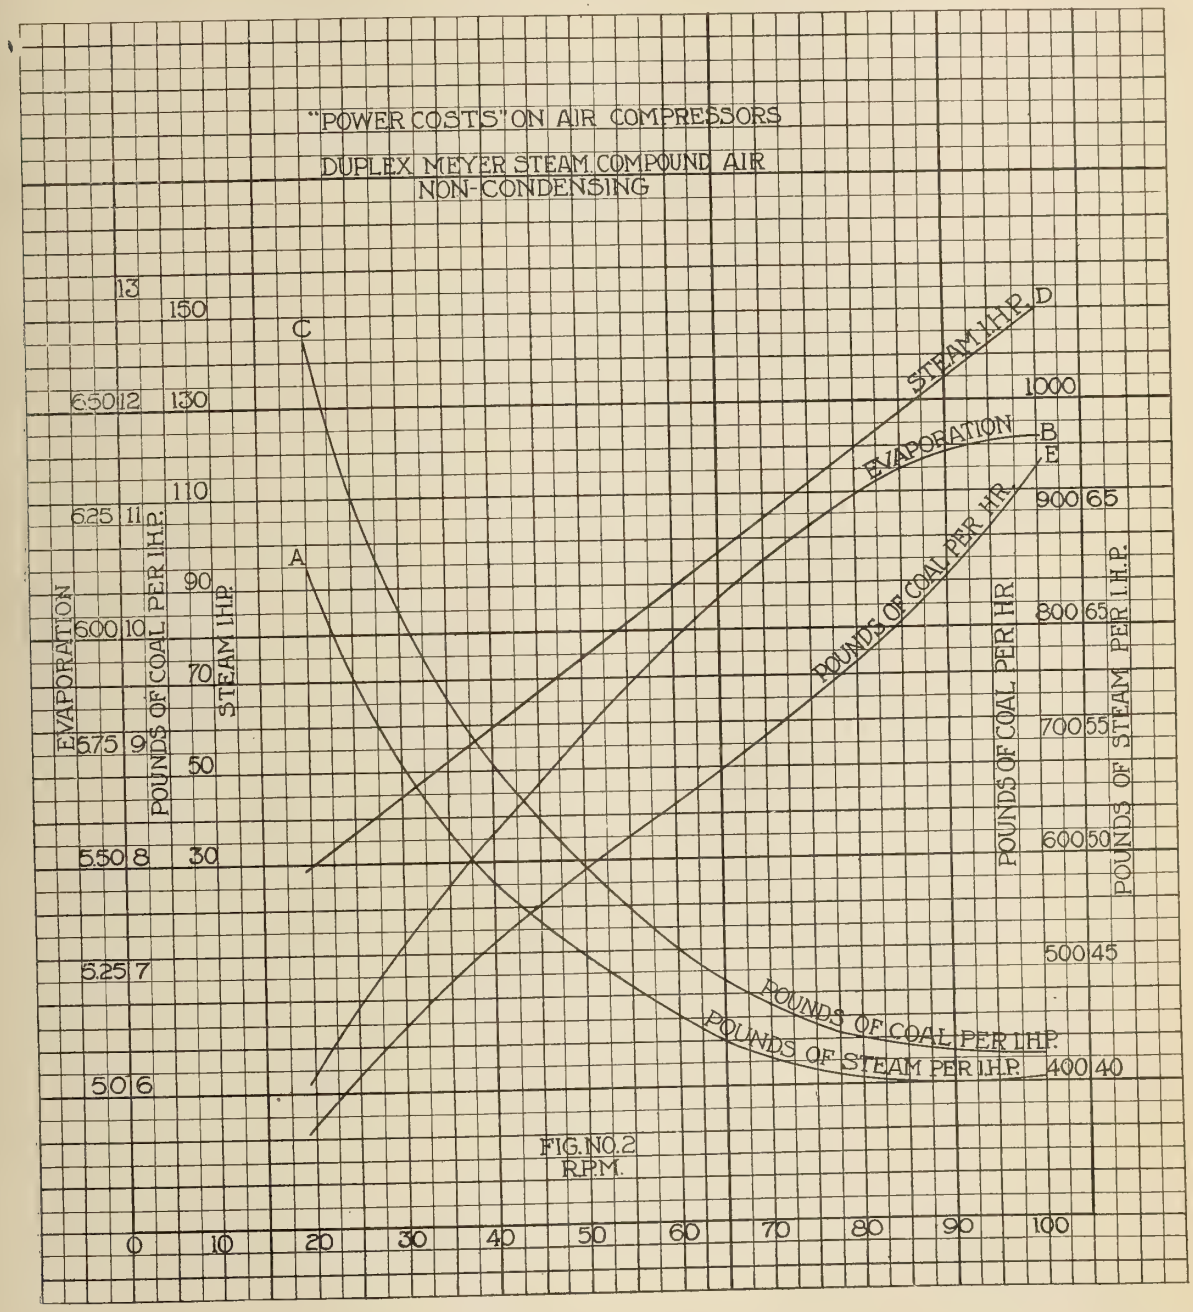


FIG. I.

mechanical efficiency without taking into consideration the other elements of loss besides friction. In fact, the manufacturer seldom mentions any other loss, leaving the impression that friction loss is the only loss to be considered. Such a test is far from answering the question as to whether the air compressor is commercially efficient, and gives no indication as to the actual effective horsepower of air compressors under ordinary working conditions.

The writer has just finished a series of exhaustive tests on a large number of air compressors. In making these tests he has had access to plants that have been in operation for a considerable length of time, and that are operating under ordinary working conditions. It is needless to state that the various companies operating these compressors employed the best technical and mechanical engineers available, and the actual results obtained may be safely taken, not only as a fair, but probably as a very high average of actual conditions existing elsewhere throughout the United States and Canada.

Canada.

The object of the following article is to point out the real efficiency of air compressors as found under ordinary working conditions. These are not shop tests.

The machines tested have been in operation for a year or more under competent supervision, and have been kept in excellent condition by competent machinists.

How the Tests Were Made.

In every case the following plan was employed in making the tests: A boiler test was run for not less than two weeks, the coal being weighed carefully, and the water pumped into the boiler being carefully measured. A meter was installed at the throttle of the compressor to measure the steam consumption. The compressor was operated over its entire range of speed at intervals of 10 R.P.M. up to its rated full speed. The average speed under which the compressor operated was determined by a revolution counter. A meter was installed on the discharge pipe of the compressor to measure the air actually delivered. The temperatures were taken at the suction, at the intercooler, and at the discharge. Cards were taken on all the cylinders. All readings were taken simultaneously. The compressor test showed by the steam rate the number of boiler horsepower required to develop a steam I.H.P. at this average speed. The compressor was then charged with the number of boiler horsepower as shown. Readings on the revolution counter of the air compressor were

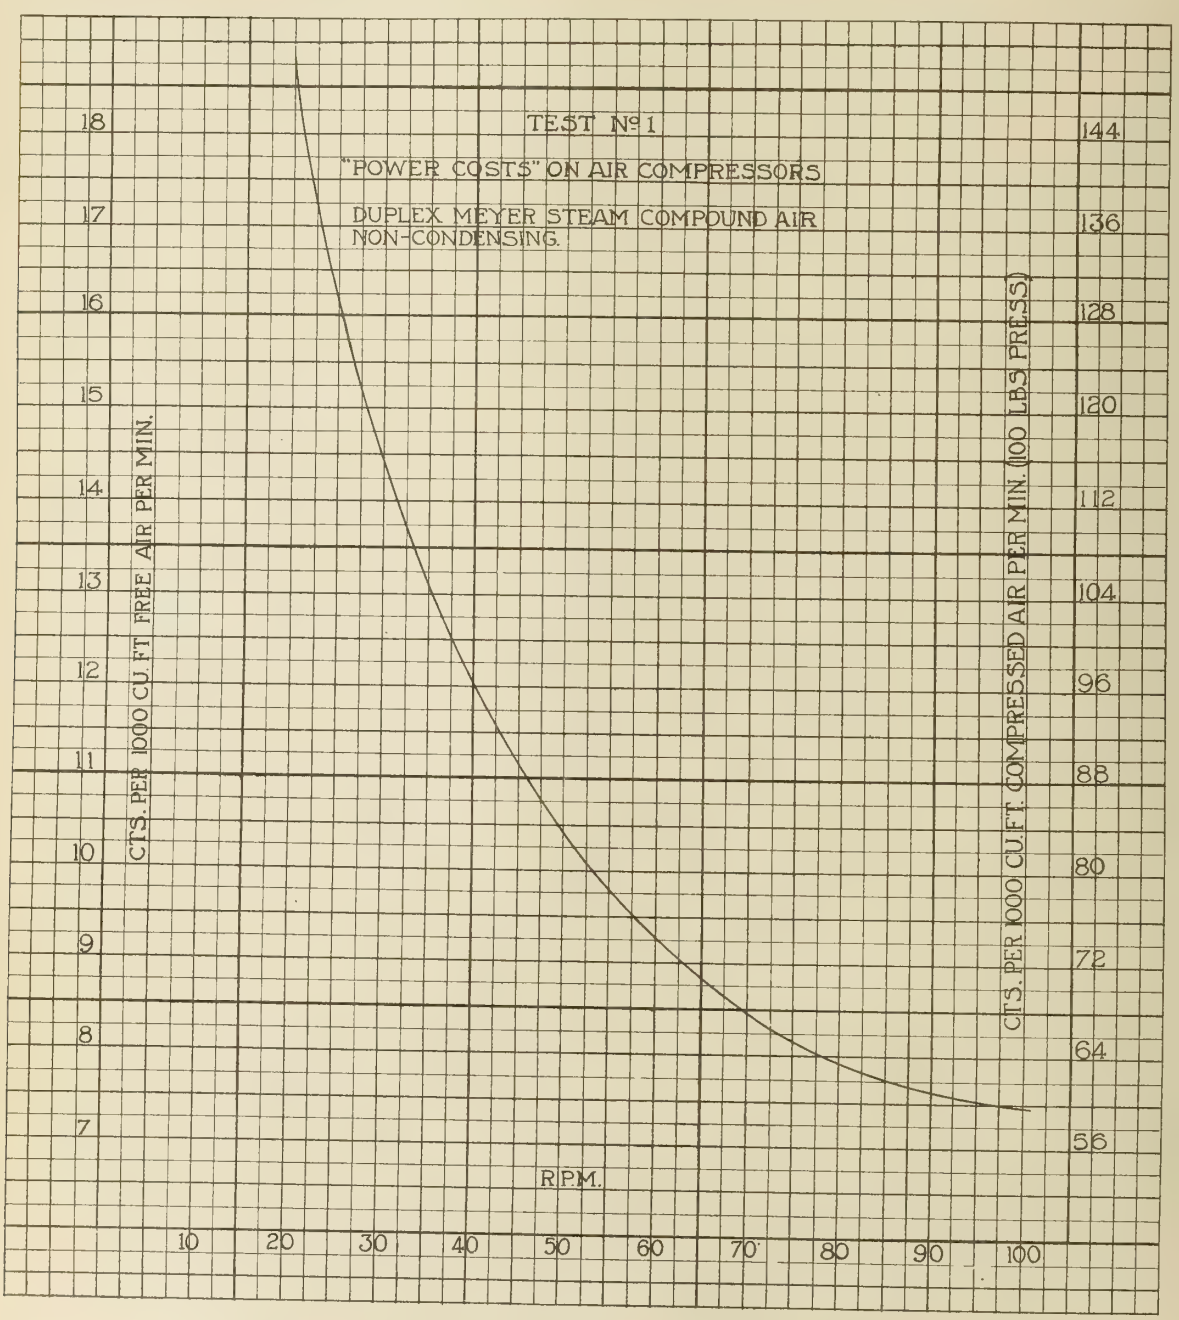

FIG. No. 2A.

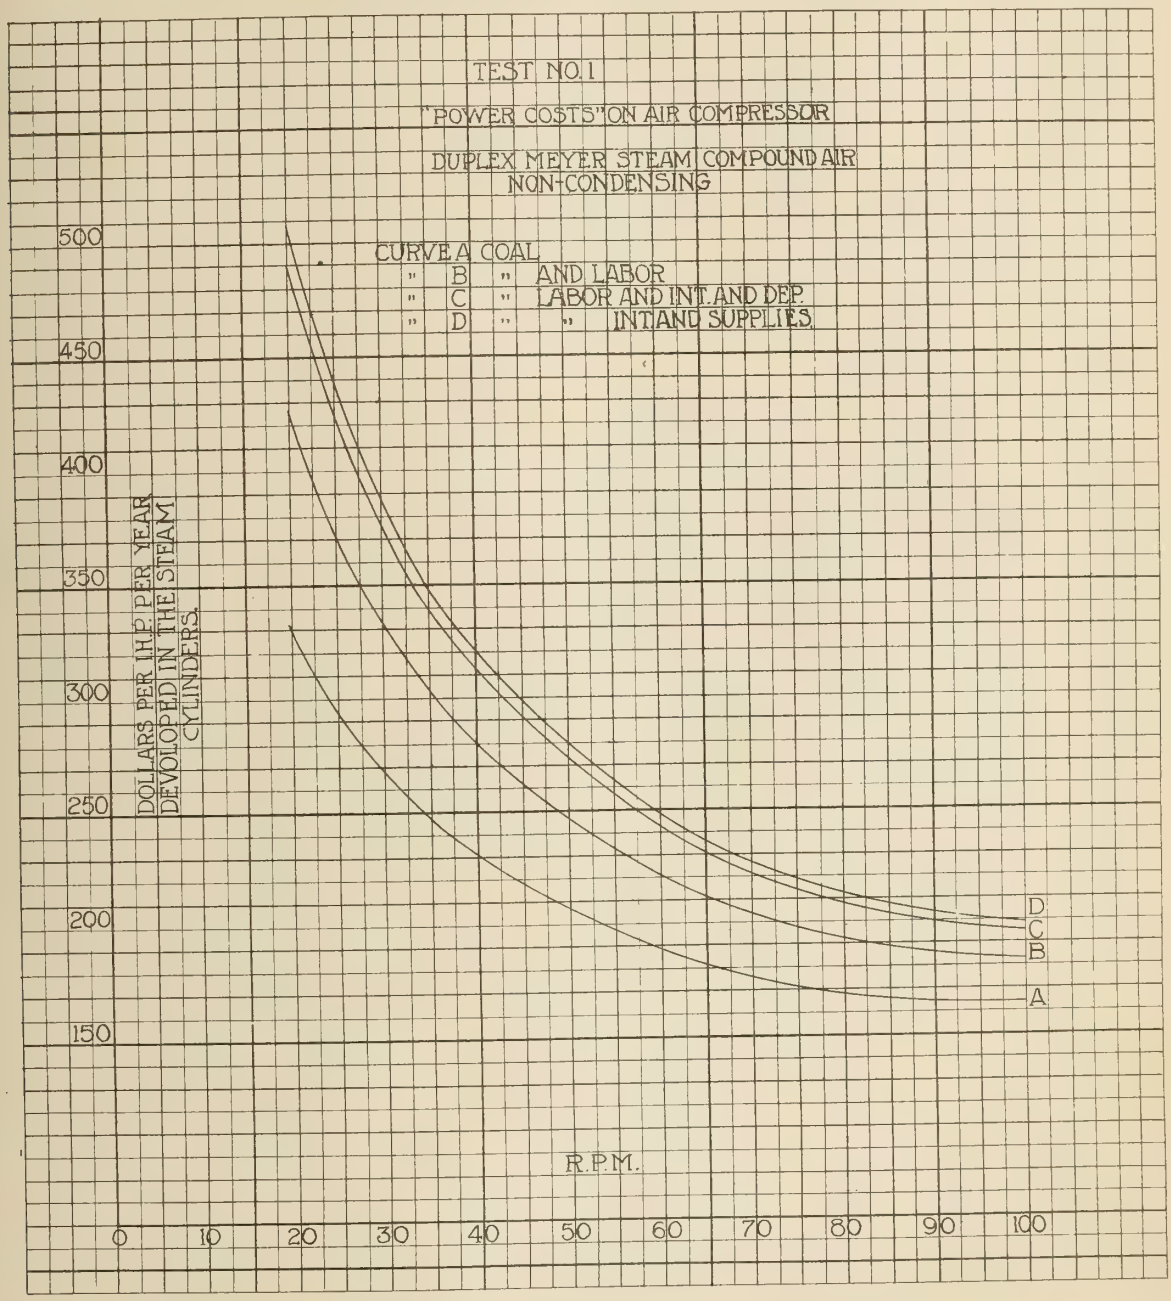
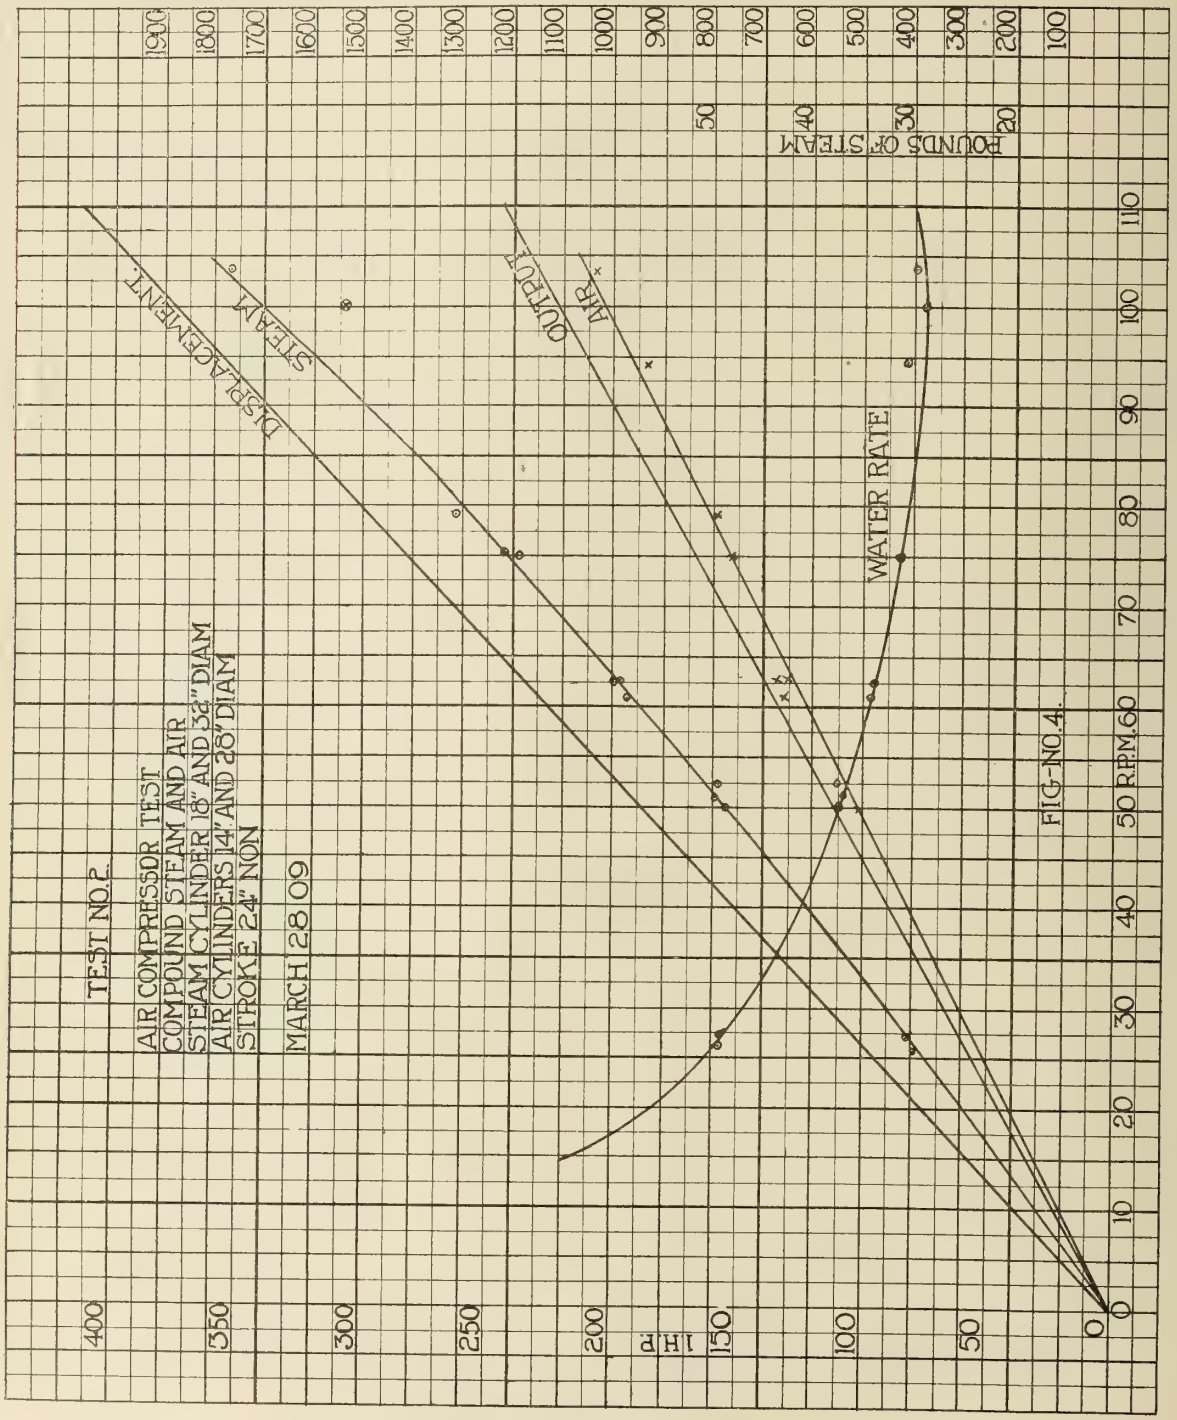
taken hourly through a period of two weeks so that the average revolutions per minute were actually determined under working conditions and were not arbitrarily assumed.



Instruments used in Testing.

The air and steam meters were of the Dodge type as developed by the General Electric Co., Schenectady, N.Y., and were operated by an expert sent by that company for that specific purpose. The indicators were of the American Thompson and Roberts-Thompson makes, which are well known and generally accepted as standard. The tachometer and thermometers were made by Messrs Schaeffer & Budenberg.

Results of the Test.



It quickly appeared that the friction loss was only a small item in the total, and that various other items of loss which have heretofore been entirely disregarded by the manufacturers and overlooked by engineers, played such a large part in cutting down the actual efficiency of the average air compressor under usual working conditions as to raise the question as to whether it is not one of the most wasteful machines ever employed.

As noted above, the manufacturers of air compressors rate their compressors by the volume of space in the cylinder. The efficiency of the machine, as they

state it, is only mechanical, and is obtained by dividing the total I.H.P. of the air cylinders by the total I.H.P. of the steam cylinders, the difference between these being the friction of the machine. For example, if the I.H.P. of the air cylinder is 100 horsepower and the total I.H.P. of the steam cylinder is 110, then the manufacturer rates the efficiency of his machine as 91 per cent. This rating absolutely disregards the losses due to the heating of the cylinder, adiabatic loss, the loss of the discharge, and the loss of delivery.

The friction loss will range generally from 10% to 25%, the first figure being the one most commonly mentioned by the manufacturers in their catalogues and prospectuses. On the other hand, losses from the various causes mentioned will run anywhere from 30% to 60%, thus cutting down the real efficiency of the average air compressor to such an extent as to make the figures of the manufacturer appear ridiculous.

Reports on Actual Tests.

The writer is not at liberty to disclose the identity

of the particular plants at which the tests were made, and for that reason the plants have been designated by numerals instead of by name.

Plant No. 1.

In plant No. 1 there were installed three 150-horse-power return tubular boilers, supplying steam for a Corliss engine, the air compressor, and the steam heating. The cost of the boiler horsepower was determined as above stated. The steam-meter was placed on the compressor during the test run, so that only that portion of steam actually used by the compressor was charged to it. The compressor was a duplex Meyer valve, simple steam, the air cylinders being two-stage, and was rated by manufacturer at 1,015 cubic feet of free air per minute at 105 R.P.M. The test at this plant lasted over a month. Hourly readings of the revolution-counter were taken, which showed the average speed of 36.05 R.P.M. The steam consumption at this speed was 51 lbs. per I.H.P. hour as measured at the throttle. The meter showed that at this speed the compressor delivered 275 cubic feet of free air per minute, an actual efficiency of 68.7.

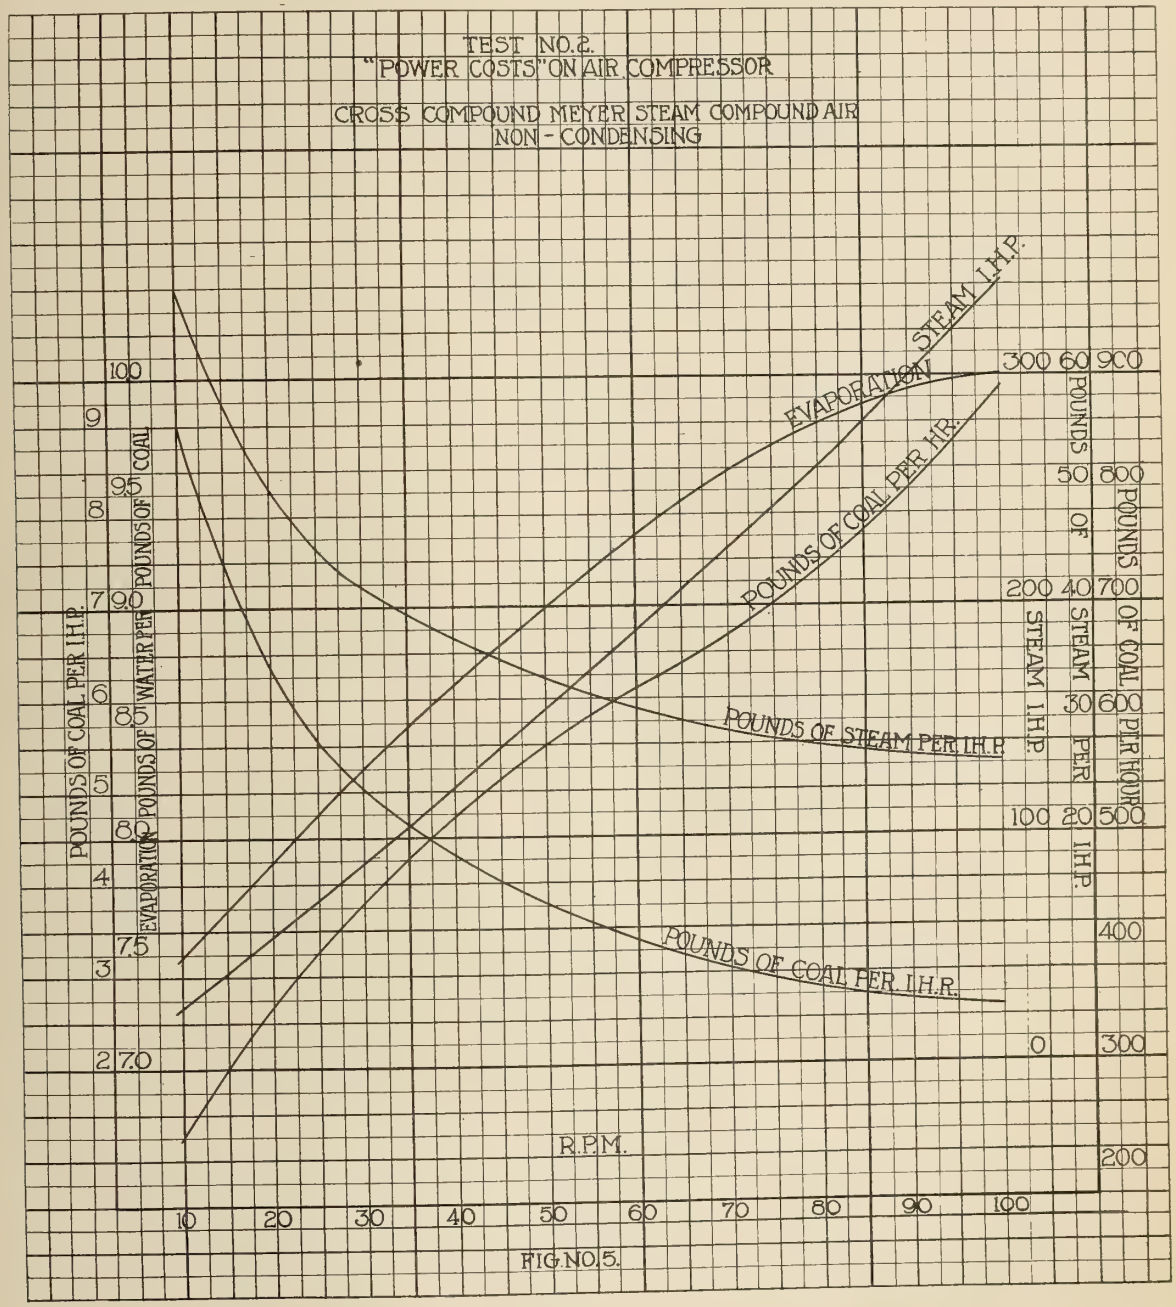


FIG. NO. 5.

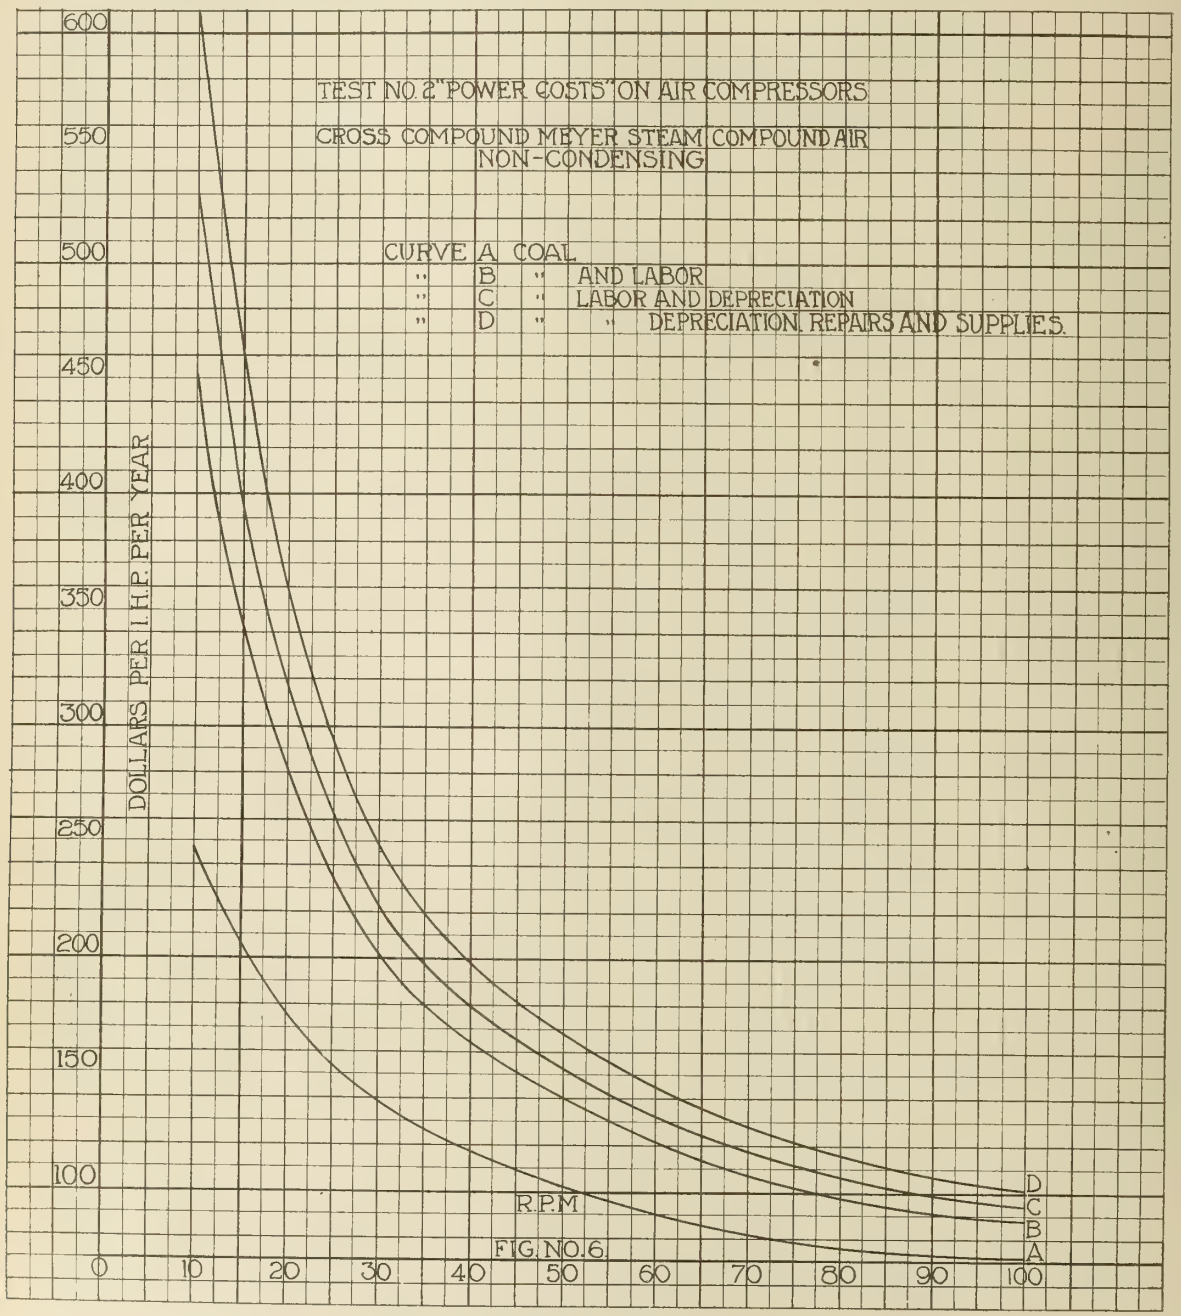
Taking the ordinary method of computing the efficiency of this compressor, at 105 R.P.M. we should have 140 indicated air horsepower divided by 157 indicated steam horsepower, giving an efficiency of 89

per cent. as compared with the actual efficiency of 68 per cent.

The cost per indicated horsepower steam per year as shown by the books of the company amounted at the average speed to about $340. for coal at $6. per ton. The accompanying diagrams show just how the tests were worked out and the results obtained.—

Fig. No. 2—Shows how the total coal consumed per hour over the entire range of speed was determined, the curves being taken A.B.C.D and E.

The accompanying table takes the coal consumption, metered air output as already determined, and costs of operating as supplied from the owner's books and shows the cost of producing compressed air. From



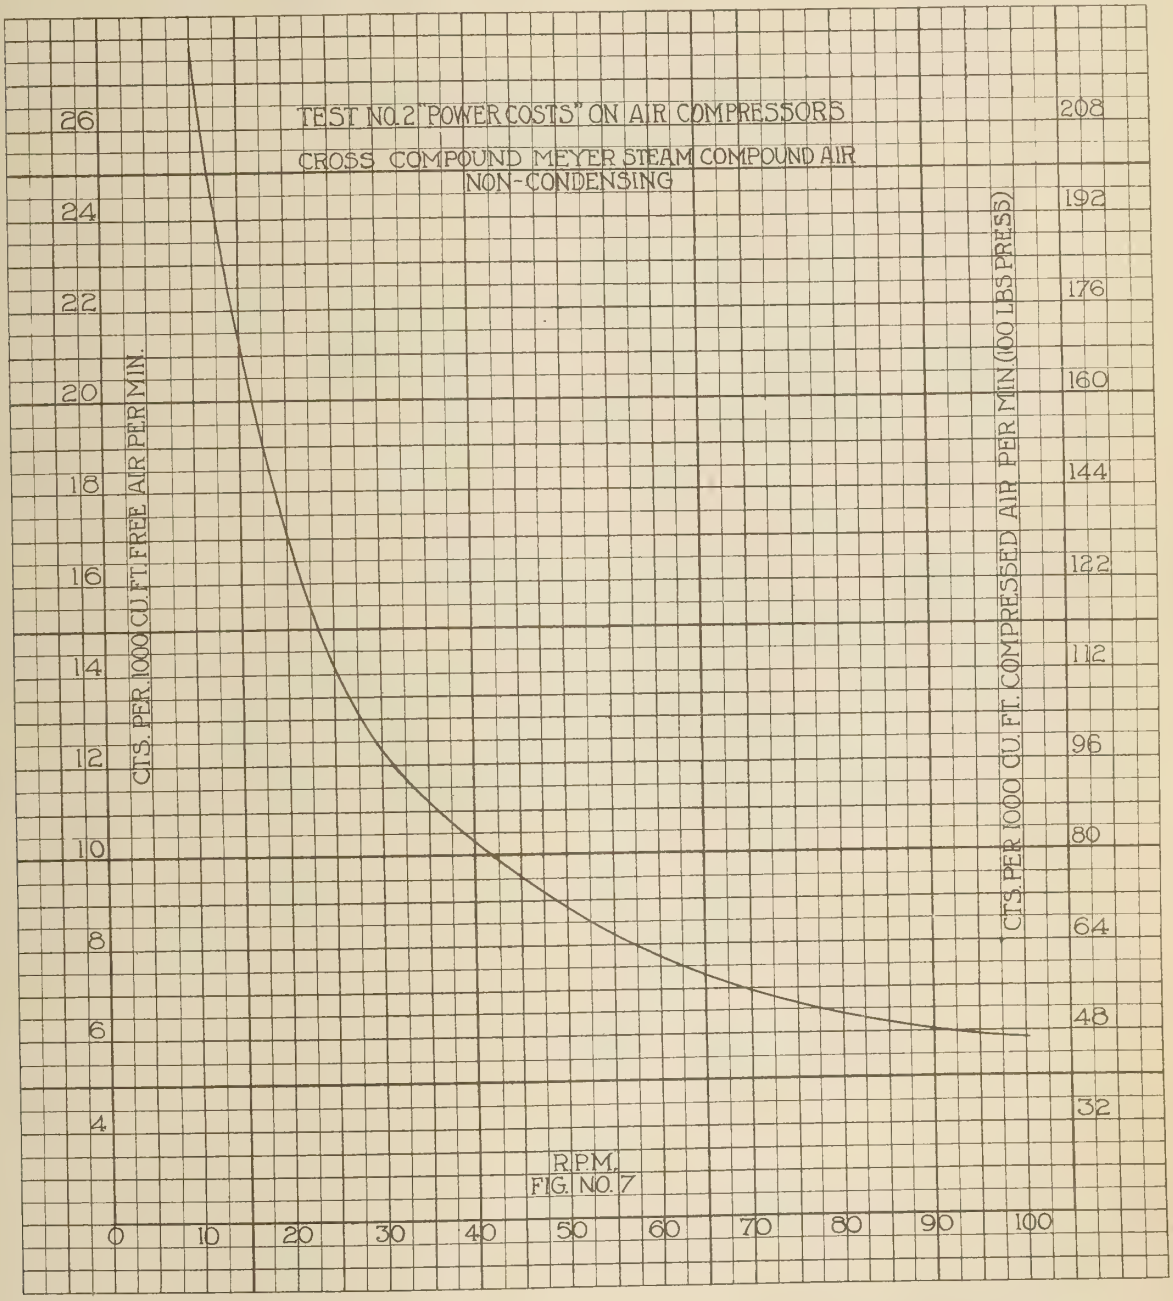


Fig. No. 1—Shows the indicated H.P. of the steam and air cylinders, the displacement of the piston, the metered air output after temperature correction and the pounds of steam consumed per indicated steam H.P. hour.

this table, the curves shown in Fig. 2 were plotted, showing the cost of producing a steam indicated horse power per year and Fig. 3 which shows the cost of delivering 1,000 cubic feet of compressed air to the receiver over the entire range of speed.

Plant No. 2.

This plant consisted of a cross compound Meyer valve steam and two stage air compressor supplied with steam from two 125 H.P. return tubular boilers. This machine was rated by the manufacturers at 1880 cubic feet free air per minute at 100 R.P.M. A two weeks' test was run on this plant in exactly the same manner as at Plant No. 1. The average speed of the compressor was 66 R.P.M., the steam I.H.P. at this speed 210, the air I.H.P. 128.5, which would show the mechanical efficiency to be 61.2%, or a friction loss of 38.8%. This is very high, and can be accounted for by the crank shaft being in bad condition. While the owner was aware of this, the machine could not be spared, having been operated in this condition for months. This is something that the manufacturer of the machine is in no way accountable for, but the writer is of the opinion that it is not exceptional, and many owners will not allow a plant to be shut down for repairs so long as it will turn over. The output of this compressor at its average speed was 734 cubic feet of free air per minute, which would show the over-all efficiency to be 46.2%.

The attached curves, Figs. 4, 5, 6, 7 and the accompanying table were worked out in the same manner as on the test of Plant No. 1 and may be followed.

Summary.

The writer has no desire to arouse a controversy on the merits or demerits of air compressors. The object of this paper is to show the absolute necessity for demanding from the manufacturer of air compressors a definite statement of the effective horsepower, or guaranteed output of compressed air, delivered by this compressor, at various rated speeds. Particularly is it desirable to require a guarantee of output delivered at speeds approximately those at which the compressor will be run in actual service. Manufacturers of electric motors give the efficiency at ¼, ½, ¾ and full and 1¼ loads. Manufacturers of air compressors, on the other hand, give only the volume swept through the cylinder by the piston and call it the output in free air, and even these data are given at only one stated speed, and that generally higher than the machine will stand for continuous operation. It should be remembered that an air compressor is generally a variable speed machine, its speed being usually regulated by a throttle governor connected to the pressure regulator, so that the machine is only called upon to run as fast as the demand for air requires it. Consequently, it is of the highest importance to require the manufacturer to give actual rating at the various speeds.

Furthermore, some definite data should be given by the manufacturer to enable the managers of plants to calculate the cost per horsepower delivered at the compressor. Up to this time, if the compressor is rated at 100 horsepower and the cost per annum $7,500, the manufacturer claims a cost of $75 per horsepower per year. Few plants, however, develop more than half

TABLE I

their rated capacity on an average, so that instead of costing $75 the horsepower actually delivered costs from $150 per year upwards. A certain amount of variation is, of course, necessary to take care of the maximum load, but such discrepancies as in the example given above should not be allowed to continue.

OUR LONDON LETTER.

Mining shares of the London Exchange during 1909. Mines of most parts of the world in demand. Even "Jungles" looking up. Technical Mining enterprise in the University of Leeds. A fine training equipment. A cupola development. A new patent boring bar with many good qualities. Export of mining furnaces. J. P. Johnson on the ore deposits of South Africa.

Special Correspondence to the "Canadian Mining Journal."

London, January 18th, 1910.

The various mining share markets on the London Stock Exchange experienced pretty fair business all through last year. The early part of the year found West African mines in favour and later on South African or Kaffirs went ahead in fine style. The last six months of the year has also been signalised by activity in Diamonds and Rhodesian descriptions.

In view of the further improvement in the technical position of the Rand gold mining industry by the reduction effected in working costs, it was evident at the beginning of the period that a revival in the Kaffir market was only a matter of time. But for the Balkan affair and the unprecedented floods on the Rand which interfered with the working of a number of the mines, the first quarter of the year would probably have seen Kaffirs active and buoyant; as it happened, the revival was deferred until the second quarter. Then dealers had no cause to complain on the score of business, and

speculators for the rise had a nice run, prices moving up substantially.

A slump, the usual sequel to a boom, came in the second half of the year, the continued falling off in the native labour supply, which, of course, affected the returns of the mines, being a depressing influence, in addition to the liquidation of the unwieldy bull account that had been built up in the market. The market was gloomy for several weeks, but when the liquidation appeared to be at an end, the lower level of values attracted fresh buyers and during the closing weeks of the year and the opening ones of 1910, Kaffirs have displayed a cheerful tone, although they have not been particularly active. End-of-the-year prices are some way below the best of the period, but still show fairly good gains on balance.

Taking a few typical mining shares, substantial gains on the year can be shown. East Rands have risen from $32.50 per share to $37.50 per share, Rand mines from $40.00 per share to $47.00 per share. De Beers, Diamond Deferred shares are up on the twelve months from $56.00 a share to $98.00 per share, and even Chartered, the share in which perhaps more money has been lost in this country than any other share existing, have moved up from about $4.00 to $7.50. In the days of Cecil Rhodes and the great men these latter shares were often loaded on the public here at $40.00 each. Their face value is $5.00.

The discovery of a new banket field in the Abercorn district of Rhodesia materially helped that market as also did such other things as the progress of the railway from the south towards the Congo and the commencement of production upon several of the copper mines in that neighbourhood. The Rhodesian gold output for the year is the largest ever obtained.

"Jungle" mines, as West African descriptions are briefly called, have made substantial progress. This district had its boom in 1900-1901 when by every boat from the West African coast there came immaculately attired negroes with leather bags of concessions, many of them, after having been sold, being untraceable to any known district in the Gold Coast Colony or Ashanti. Last year, however, the great South African mining house, known as the Consolidated Gold Fields of South Africa took part in the reorganization of leading West African mining concerns and other big Rand houses such as Wernher, Beit and Goerz, have followed. It is due to this influential backing that the West African mining field is on a sounder basis than ever before. Prices of the dozen leading mines are, with one exception, up on the year.

West Australian mines have been weak and prices are down on the year with very few exceptions. This group makes the least satisfactory showing on the year. Broken Hills have been busy and are better for it, although Australian labour troubles have tended directly to restrict business in this group during the last few months. Tin shares have not showed much life and it seems impossible to revive public interest in either Indian or Russian mining descriptions.

The technical section of the University of Leeds is so remarkably well equipped and is such a new feature that a brief reference to its coal and metallurgical mining department there will be of interest. The accommodation of this department includes, in addition to the lecture room, which will seat fifty students, a drawing office, a general mining laboratory and a photographic and lamp room. There is a full equipment for underground and surface surveys and a shaft-plumbing outfit.

The general mining laboratory is arranged for the study of ore dressing and coal washing, using small samples. There are laboratory crushing and sampling machines, slime tables, small jigs, upward current classifiers, and settling-boxes, with gold-washing pans, and other apparatus. In order to test the products from washing, there is the necessary assaying equipment.

Larger-sized machinery for coal-washing and ore-dressing is placed in an annex to this laboratory. There is a stone-breaker 8 in. by 5 in., a three-head prospecting battery, a pair of Cornish rolls 15 in. by 9 in., a modified trough-washer for coal, a record vanner, a 9 ft. percussive vanning table, and a four-compartment Hartz jig.

The mining department has also a centrifugal pump, which is electrically-driven, and an experimental fan suitable for research and elementary work. A transmission dynamometer enables power measurements to be made. The galleries, which are used for explaining and demonstrating matters which affect the ventilation of coal-mines, are of great service in enabling the student to grasp the principles of this important detail of mining work. The mining department receives occasional students direct from the works, and university mining students are instructed in underground and surface surveying at the mines, as well as in general mining work. The mining and the gas departments seem to be closely affiliated, to the benefit of both. Especially advantageous is this arrangement for testing lamps in explosive conditions. There is obviously a close connection between the two great industries of coal-getting and coal-using. Whatever kind of gas is made, and from whatever materials—coal, coke, or oil—the gas engineer is dependent upon the miner for the supply of the raw material. There is a feeling of the fitness of things when we see both departments so closely allied with each other and with the engineering department.

The support given to the mining department by the West Yorkshire Coal-Owners' Association and the Drapers' Company of London should be mentioned for it is difficult to over-estimate the advantages, to the University and the practical men in the industries concerned, of this assistance. It may be mentioned that the well-equipped geological laboratories of the University are an essential adjunct of the mining department.

A well-known firm of foundry engineers of Keighley, Yorkshire, has introduced a small cupola for melting from one to ten hundredweights (English) of iron per hour. It is said that mining engineers will find this cupola of great convenience in the event of a breakdown in machinery, which needs immediate repair in order to avoid disturbance of work and consequent loss. A mine is often situated a long distance from a foundry, and to such a one this emergency cupola is of special value as it provides at small cost, cupolas of greater efficiency, the means wherewith to make a casting for repair work on the spot without delay. The Taquah Mining and Exploration Company of West Africa are amongst the users of this inexpensive little cupola for rapid melting.

There have been a good many objections to drilling machines of the hand-held hammer type, but they are gradually being cleared off. A new patent boring bar put on the market by a well-known house here, appears to go a long way towards getting rid of any remaining trouble. In very hard rocks where the rate of penetration is less than 4-6 inches per minute, and when the boring holes are above the level of the waist, the workman needs to rest occasionally, thus losing time and les-

sening the output of the machine; or it is not uncommon to find one man taking the dead weight of the machine, and another pushing it forward against the rock. The automatic feed and standard overcome this trouble to a certain extent, but have the disadvantage of taking up room in the heading, and in addition one of the greatest advantages of the hand-held hammer drill is lost, i.e. the possibility of continuing the boring whilst loading out is in progress.

The patent Simplex boring bar overcomes these drawbacks. It is a solid forging throughout in steel, and is provided with a tapered circular portion at one end through which a hole is bored to permit the drill steel to pass freely. In operation the machine is first used to bore a hole (slightly larger than the finished hole) to a depth of two or three inches. This work occupies barely a minute under any circumstances. This drill is withdrawn from the hole and the slide bar driven in. The machine is placed on the bar, and boring commenced in the usual way. The workman merely pushes the machine forward as fast as the hole deepens. It will be seen that the machine is fitted with a bracket fitting round the slide bar, and it has no tendency to loosen itself. When the boring is finished, a few taps with a hammer are sufficient to loosen the bar in readiness for the next hole. A large number of these machines have been supplied for metalliferous mines as well as collieries, and I am informed that they are being used for sinking and stoping in some of the hardest rocks known.

The Merton Furnace Company is doing good business with its furnaces. Thirteen have just been shipped out to Tasmania. Some of these are to be erected at the Mount Hercules Mine, which is adopting the Gillies process, others on the Rosebery mine, which is adopting the Metals Extraction bisulphide process, and one is going to Broken Hill.

A new mining book by one who knows is J. P. Johnson's "Ore Deposits of South Africa." The author is a mining geologist and engineer living in Johannesburg and his book is right up to date. It deals chiefly with the two great gold-fields of South Africa, where the mode of occurrence of the precious metal is remarkably similar in many important respects and is yet so distinct from that of the other big gold deposits of the world as to constitute a type demanding separate consideration.

The Witwatersrand goldfield is a bare ridge of hills about 30 miles in length and the ore deposit in regard to length of strike—its outcrop and sub-crop has been traced for a distance of 70 miles—and continuity of pay values is unique among and stands at the head of the great ore deposits of the world.

Some idea in the way of comparing this field with others may be gathered from the statement that the next in order of size is the Kearsarge amygdaloid of the Lake Superior copper field, which has seven producing mines, four developing mines and one idle mine ranged over a distance of nearly fifteen miles, and which is in turn approached only by the Baltic amygdaloid of the same field with its promise of a future ten mile line of mines.

The Theta-Beta horizon of the Pilgrimsrest goldfield will, however, eventually take second place. Three possible explanations are given as to the origin of the gold in the auriferous conglomerates of the Rand, but not one of these is generally accepted. The theories are:—firstly, that the gold, together with the quartz-pebbles, is derived from the denudation of gold bearing rocks; secondly, that it was chemically precipitated from the water at the time of the formation of the beds; and thirdly, the theory is that the gold, together with the minerals that form the bulk of the matrix, was subsequently introduced into the conglomerates by percolating solutions.

Explanation number two is not even nowadays given serious consideration. The others, namely that the gold is either a detrital accumulation or that it is an impregnation, have powerful followings. In the newer Pilgrimsrest goldfield the presence of the gold in the beds is clearly an impregnation.

Johnson's book is of great service to prospectors, students and others possessed of an elementary knowledge of geology and some mining experience.

MINING ENGINEERS AND MINING INSTITUTES.

Written for the Canadian Mining Journal, by A. B. Willmott.

With the objects aimed at in Mr. Kendall's paper I fully agree and thank him for having again presented the subject for discussion. Several objections to the scheme occur to me, and I believe the objects sought can be better obtained in other ways.

His scheme as I understand it entails:—

1. A serious restriction in the number of the members of the Institute.

2. The formation of a close corporation with powers similar to those now possessed by the doctors, dentists, et al. and which are being sought by the embalmers of Ontario.

My objections are as follows:—

1. The proposed restriction of membership I consider a mistake. We need a wide-open congress of some sort, where all interested in mining, whether technically qualified or not, can meet and discuss matters of common interest. This our institute is now doing well. Let us move slowly in the matter of change. We want the broker and investor to attend our meetings, and learn the views of our leaders on the ethics of mine finance, and on the duties of directors to their shareholders. To shut out these men and also the younger men of the profession who might not be able to qualify, is to shut out from the Institute the very men who profit most.

Again to get sufficient numbers in the small local centres to make a live branch, the basis of membership must be wide. These members are by constitution members of the main Institute.

Still further we require all the funds we can raise to carry on our work. To restrict the membership to purely technical men would sorely cramp the Institute financially.

2. My second objection is the great difficulty of securing the legislative power to compel all engineers to pass the necessary examinations and enroll in the Institute. This matter is controlled by the provinces, and it would mean a separate campaign in each for a number of years. Then, in all probability it would be found that the conditions prescribed by the different provinces would not be alike. The doctors and the dentists who are far in advance of us in organization, have not yet succeeded in getting a common standard for all the provinces. If worth while I would not balk at this difficulty, but I think there is a better way.

3. My third objection is that even after the membership has been restricted in the way Mr. Kendall proposes there will still be "engineers and engineers" as he himself states. A man may be an excellent chemist, and so fully qualified for membership in the Institute, and be quite incompetent to report on the best

methods of developing a mine. Another man may be thoroughly versed in mine machinery and so an acceptable member, and yet not be qualified to value a placer deposit. The truth is, the mining engineering profession is a very wide one and no man can be thoroughly qualified in all its many branches. Yet. under Mr. Kendall's proposals we would virtually say to the public "the membership of this Institute has been carefully selected by law and you can safely employ any member for any mining service."

My solution of the problem, is the voluntary incorporation by some of our leading engineers of a Mining Engineers Guild. The qualifications for membership would require a high standard in technical education, experience and probity. There should be an initiation fee of fifty or a hundred dollars, and an annual fee of ten dollars over and above membership in the Institute. This money should be spent in educating the public to the necessity of employing only competent engineers. Advertisements would state the qualifications for membership in the Guild, and urge the public to demand reports by fully qualified men. Lists of all members with their special qualifications would be kept by the secretary. Advertisements would state that these lists would be furnished on application. This advertising would be of great assistance to the individual, and he could well afford the fees charged for membership. Nor would it interfere with his own advertising.

Such a guild would urge the employment of competent engineers as no individual could think of doing. It could criticise fraudulent promotions as no private engineer dare do. It would protect its members against the unfair use often made of their reports. It could control the whole subject of professional conduct by its own by-laws.

Some of the qualifications for membership in such a guild would be:

An age limit, say thirty years.
Graduation from some recognized college.
Practical experience of—— years.
Ethical qualifications.
Canadian residence.

It is recognized that many of our most qualified men might not join such a guild, having at present positions where they are not looking for public employment. There would be no compulsion that they should join. Many who might like to join might be debarred for a time, until age or experience gave them the necessary qualifications. As soon as they qualified they would be received. All Guild members should be members of the Institute in good standing.

In proposing this alternative scheme I am quite aware that objections can, and will be raised just as I have raised them to Mr. Kendall's proposals. I offer the suggestions, with the hope that out of the joint opinions of the members a scheme can be evolved which will involve the mining fakir in oblivion.

LEGAL COLUMN.

[Editor's Note.—Before this appears in print the Senate will probably have dealt with the proposed addition to the Criminal Code. The points brought out by our correspondent, however, are of signal importance.]

A debate arose in the Senate last week on a proposed addition to the Criminal Code, making it an offence for a person to have ore in his possession for which he couldn't account.

Legislation of this kind has regularly followed the founding of mining camps. It probably started in Australia, where there is still a most stringent statute in force, under which it is an offence to be the occupier of premises where gold suspected of being stolen is found, or to walk along a vehicle containing such gold. The discovery of diamonds in South Africa resulted in the development into an established industry of illicit diamond buying. Such great ingenuity was shown by the workmen in concealing diamonds that emetics and purgatives were used to supplement the law. Consequently the law was made as stringent as possible. It is a compliment to our enforcement of the laws we have that the demand for more easily enforced legislation has been so long delayed.

The following is the proposed addition to the Criminal Code: "424A. Everyone is guilty of an indictable offence and liable to two years' imprisonment who, having in his possession or on his premises with his knowledge any rock, ore, mineral, stone, quartz or other substance containing gold or silver, or any unsmelted, or untreated, or unmanufactured, or partly smelted, partly treated or partly manufactured gold or silver, is unable to account satisfactorily for or prove his right to the possession of the same."

This section was passed by the House last year with the words, "prove that he came lawfully by the same," in the last line instead of the words, "account satisfactorily for," etc., but it was rejected by the Senate. The objection raised in the Senate appears to be that the proposed section is a departure from well-recognised rules as to the onus of proof, and may work a hardship on persons having ore in their possession, but being unable to prove technically where such ore came from. It was to meet this objection that the clause was amended in the House this year.

In its amended form this objection does not really appear to be very serious practically, and it is largely on the question of principle that it has been opposed in the Senate. The principle, however, has suffered other breaches in the Code. One wonders if the attention of the Senate has been called to the strange provisions of Section 395: Where anyone has in his possession "any live or dead fence, or any post, pale, wire, rail, stile, or gate, or any part thereof, of the value of 25c at the least," and cannot satisfy the justice of the peace that he came lawfully by the same, he is guilty of an offence and liable to a penalty not exceeding $10 plus the value of the article so found."

After that there cannot be any serious departure in principle in the passage of the new amendment proposed. In fact, the Code already provides (Section 988) that the possession contrary to the provisions of any law on that behalf of any smelted gold or silver or any quartz-bearing gold or any unsmelted gold or silver by any operator, workman, or labourer, shall be prima facie evidence that the same has been stolen by him. This provision was passed, we believe, to stop high-grading in Nova Scotia. (One of the objections raised to the proposed section is that it was for the benefit of Ontario alone.)

The present law regarding stolen ore is embraced in two sections of the Code: 378 and 424 as amended in 1909. Section 378 makes it an offence punishable by two years' imprisonment to steal ore of any metal or any quartz, etc. With this paragraph should be read Section 637, which provides that a justice of the peace may issue a search warrant as in the case of stolen goods upon a written complaint to search for gold or quartz, silver or silver ore, and that such justice may restore it to the lawful owner as he considers right (subject to an appeal to the County Court judge).

At the same time, Section 893 provides that an error in the indictment under Section 328 or 424 as to the name of the owner may be amended at the trial, and that if no owner is proved, the indictment may be amended by alleging the Crown to be the owner.

Section 424, Sub-section 3, prior to the amendment of 1909, made it an offence punishable by two years' imprisonment for any person not the owner of a working claim, or the agent, or not authorized in writing by the proper officer named by any Provincial Act, to sell or purchase any quartz containing gold or any smelted gold or silver within three miles of any gold district.

Sub-section C provided any person who purchases any gold in quartz or any unsmelted or smelted gold or silver of the value of one dollar or upwards, except from such owner or authorized person, should execute a written instrument, setting out the particulars, and file the same with such proper officer within twenty days.

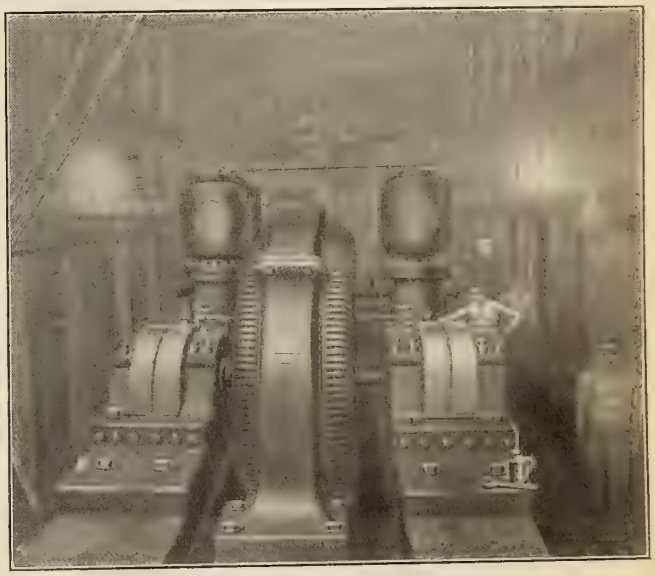
This section is obviously very defective. It would work hardship in the Yukon, where gold dust is used as a medium of exchange, and it was useless in Ontario, where no officer was provided to issue licenses to deal in gold, and consequently there was no place where the instrument required to be filed could be filed.

The section was amended in 1909 to include "any rock, ore, mineral, stone, quartz or any substance containing gold or silver or any unsmelted, untreated or unmanufactured or partly smelted, partly treated or partly manufactured gold or silver." The three-mile limit was abolished, the instrument was required to be filed within ten days with the officer with whom bills of sale and chattel mortgages are filed, and the Yukon Territory was excepted from the section.

The original section was evidently borrowed unreflectingly from the Transvaal ordinances. Even as amended, it is much more limited than the Transvaal ordinances, which prohibit trading by or with any person without a license. Under that statute it has been held that it is not necessary to prove that the accused was seen to handle the gold, it is sufficient if the gold was found in his possession; it has also been held that it is no defence that the accused acts as agent for another; and that the mere fact of agreeing to buy without an actual sale taking place is a breach of the ordinance. None of these cases would be covered by our present statute.

INDUSTRIAL SECTION.

A LARGE ELECTRIC MINE PUMPING INSTALLATION FOR HANDLING HOT WATER.



In reopening the Ward shaft, at Virginia City, Nev., a considerable flow of hot water was encountered, which for a time baffled the efforts of the workmen. The great depth of this shaft, 3,480 feet, and the high temperature of the water, 175 degrees, made the work of pumping out the impounded quantity very difficult, but a temporary electric pumping outfit was finally successfully put into commission, and has since been supplanted by a permanent installation, which easily handles the present continuous hot flow.

For the emptying of the mines, in the first place, a temporary motor-driven pump equipment was installed, by which compressed air driven sinker pumps at the bottom of the shaft lifted the water to a centrifugal pump on the 2,330 ft. level. This in turn delivered to a vertical triplex pump on the 2,100 foot level. The sinker pumps were supplied with compressed air from two 100 horsepower Ingersoll-Sergeant compound air compressors driven by 100 h.p. Westinghouse motors, located on the surface. The three stage Byron Jackson centrifugal pump on the intermediate level was belted to a 50 h.p. Westinghouse induction motor, while a 100 h.p. type "C" Westinghouse induction motor drove the 6¾ x 8 inch Knowles vertical triplex pump at the uppermost pumping level.

This apparatus has since been replaced by the installation of the permanent pumping plant located in a pumping station 80 ft. long, 24 ft. wide and 20 ft. high, connected with the shaft 3,100 ft. below the surface. The permanent pumping equipment consists of a special slow speed, 800 horsepower Westinghouse type "H F" induction motor direct connected to a Knowles express type, duplex, double-acting pump, operated at 195 revolutions per minute.

The valves are of the automatic Poppett type arranged in nests of 13 each, presenting a valve area of 104 square inches, which makes necessary very slight movement of the valves, and is conducive to a high speed and a minimum of wear. The valves and other visible parts are of bronze, and the pump has a capacity of delivering 1,600 gallons per minute against a total head of 1,550 feet.

The plant is equipped with a three stage electrically driven air compressor for charging the air receivers, besides a vacuum pump and an automatic oiling system.

For convenience of erection and repair, the pump station will be fitted with a 15 ton travelling crane; in fact, it is intended to include in this plant everything that will insure reliability and ease of operation.

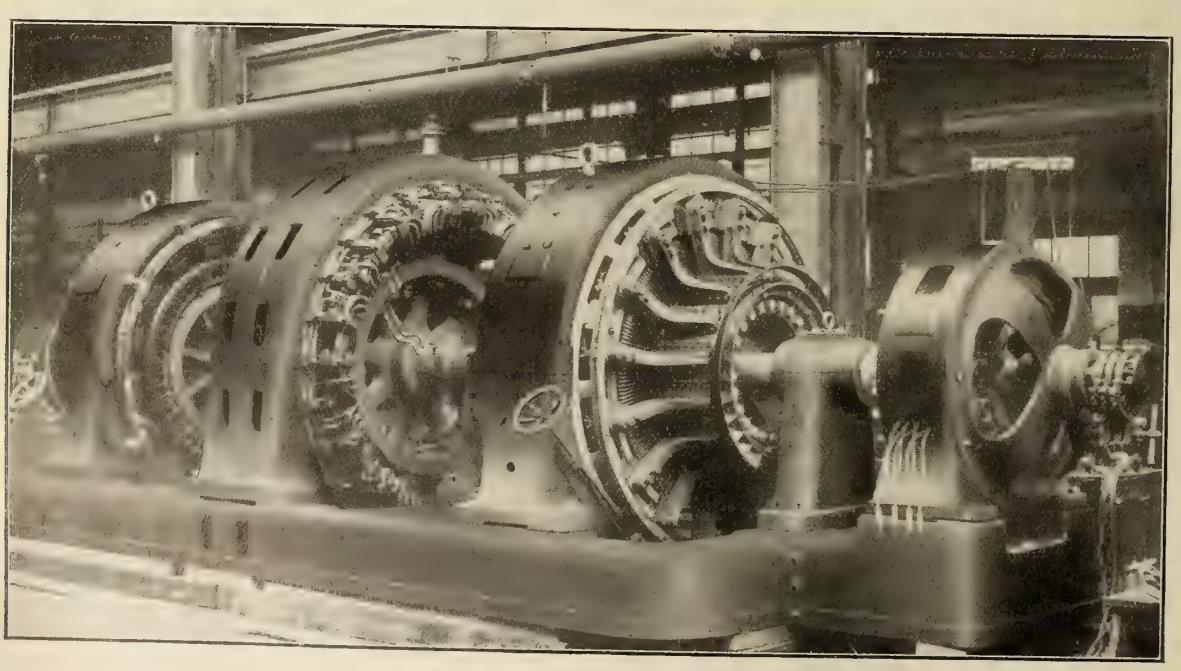
The over-all dimensions of each pump are 27 feet 3¾ ins. in length, 17 feet in width, and 14 feet 2 ins. in height. The motor is 13 feet in diameter, and the steel crank shaft, forged from one piece, is 13¾ inches

in diameter and 14 feet 4½ inches long. The total cost complete for operation was about $125,000. These pumps are supplied by either one of the two centrifugals located in the pump at the bottom of the shaft, and operated by special 75 h.p. Westinghouse motors on a vertical shaft.

The water is discharged through a 16 inch steel column with welded steel flanges. The thickness of this pipe varies from ¼ inch at the tunnel level to 9-16 inch at the bottom. The column is supported by means of heavy weight iron clamps 6 inches in length, which in turn rest upon the wall and end plates. To resist the pressure of 675 pounds to the square inch, male and female flanges are used and each fitted with a lead-filled copper gasket.

The electric current is taken down the shaft at 2,240 volts over a three-conductor, lead-covered, steel-armored cable of 400,000 circular miles capacity. The electrical equipment, from the automatic oil circuit breakers on the surface to the motors themselves, is the best that money can buy; and in operation, with the splendid Westinghouse plants of the Truckee River Electric Company behind it, results have been obtained never before approached for this class of work.

The accompanying illustration of the present permanent pump house, 3,100 feet underground, was retouched from an actual flashlight photograph, obtained during a recent visit to the mine. The normal temperature of this pump room, 110 degrees Fahrenheit, is attested by the costume of the men, who work their daily shifts of twelve hours under these conditions.



BRUCE, PEEBLES & CO.

Announcement is made on another page of this issue of the establishment in this country of the business of Bruce, Peebles & Co., Limited, Edinburgh, Scotland, manufacturers of electrical apparatus, through their Canadian representatives, Messrs. Vandeleur & Nichols, Dineen Building, Toronto. The firm of Bruce, Peebles & Co., Limited, was established in 1866, but it was not until 1897 that the electrical department was added. The business, however, in their electrical specialties has grown so rapidly as to almost eclipse other departments, and the works were gradually increased until they now occupy a site covering ten acres, the location being near Granton, just outside of Edinburgh.

It is interesting to note that the works are entirely self-contained, water is pumped from their own wells and the sewage treated in a septic tank in the grounds. Steam boiler house and gas producer plant provides the motive power for large generators, while a storage battery will operate all the lights and any department when the main plant is closed down. The main works building is 600 feet long by 150 feet wide, and is divided into five bays. Additional structures provide accommodation for office staff, drafting, designing and estimating departments.

Messrs. Bruce-Peebles were not long in the field before it was recognized that their product stood for all that was desirable in quality of workmanship and material. The passing of time proved the reliability of their machines under periods of stress and overloads, and their desirability under all conditions of service. The British Government repeatedly places large contracts in their hands, of which mention might be made of H. M. Dockyard, Chatham; H. M. War Office, Watham Abbey Powder Factory; Enfield Small Arms Factory; H. M. India Office, equipment for state railways, and the Crown Agent for Natal Government, turbo-generators and motor converter sets. Other large contracts have been awarded, such as the furnishing of complete street railway systems for Shanghai, China; Delhi, India; Athens, Greece; Llandudno and district, Wales, and Sunderland and district, England. These systems have included the entire equipment from the powerhouse to the conductors' uniforms, and were turned over to the purchasers in actual full operating order. In addition to these contracts, numerous other large installations for industrial purposes could be mentioned.

Messrs. Vandeleur & Nichols form the last connecting link in a chain of branch houses and agencies which encircles the entire globe.

One of Two 1,500 H. P. Motors supplied to the Newcastle on Tyne Electric Supply Co.

THE LARGEST ROCK CRUSHER IN THE WORLD.

The largest rock crusher in the world will be one of the features of interest at the rock crushing plant, which Messrs. Laurin and Leitch will have in operation at Outremont, Quebec, within a few months. They have contracted with the Montreal Water and Power Company to build a reservoir about 800 feet long and 400 feet wide on the side of the mountain and, as the contract must be completed within four years, one of the problems involved was the economic disposal of the rock which is to be excavated. In view of the large and increasing demand for crushed stone for concrete and other purposes, they decided to erect a plant of sufficient capacity to take care of all the rock which might accumulate during the process of the work. Having visited the largest and most modern crushing plants in the United States, especially in New York and Michigan, Messrs. Laurin and Leitch selected the Gates gyratory breakers as those best suited to their requirements, and gave to Allis-Chalmers-Bullock, Limited the contract for the complete equipment. It will involve an expenditure of upwards of $200,000.

Another serious problem was to arrange a plant of such proportions on the land available in that locality. Messrs. Laurin and Leitch purchased a site about 1,000 feet away from the reservoir and have arranged for direct connections with both the Electric Railway and the C. P. R. while the quarry cars will be hauled along two incline railways from the reservoir to the edge of the crushing plant property. There will be a powerful hoisting engine, capable of lowering four cars, each carrying 20,000 pounds in one train over the incline of 1,000 feet at the rate of 250 feet a minute. The incline will be operated with two barneys, so that if desired an additional train of rock may be elevated to the crusher plant without letting the empties down as the barneys carry the rope back. By this method no coupling or uncoupling of trains will be necessary. Two additional hoists will operate separately, each taking one of these loaded cars at a time, elevating it to the crusher, and, after it is dumped, lowering it to the bottom of the incline again. Steam shovels will be used for loading the quarry cars.

The principal rock crusher known as a No. 21, weighs 240 tons, and has a capacity of 10,000 tons in ten hours, or about 500 railway car loads daily. This machine receives the largest pieces which it is practicable to take from a quarry and crushes them without the need of any preliminary breaking by sledge hammer, or secondary blasting. There are two discharge openings through which the crushed product leaves the machine instead of only one which is usual with smaller breakers. It is thus possible to build the machine lower and make it more stable. The broken rock from each spout will fall into large steel frame elevators, which in turn will deliver it into heavy steel frame screens, each 6 feet wide and 22 feet long with 2¾ inch perforations. The rock which escapes this mesh will be conveyed to several of the No. 6 Gates breakers, equipped similarly, though on a smaller scale, with elevators and screens. To care for such an enormous amount of stone daily, there will be a carefully planned system of storage piles and bins while the tracks will be arranged in such a way that crushed stone can be loaded by steam shovels into either railway cars or horse carts.

Having purchased the largest rock breaker in the world, Messrs. Laurin and Leitch determined that the rest of the equipment should be of the most modern character. The entire plant will be driven by a 700 h.p. triple expansion engine, and a cooling tower will be erected so that the engine may run condensing. Electric power will be used whenever it is advantageous, and the firm will have its own electric plant consisting of a 175 k.w. alternating current generator, belted to the main shaft, switchboard, transformers and other apparatus. The smaller breakers, elevators and conveyors will be run by induction motors. Even the rock drills will be operated by electric power. When completed the plant will be the largest of the kind in Canada. Allis-Chalmers-Bullock, Limited, will act as consulting engineers in connection with the erection and operation of the plant.

CORRESPONDENCE.

The following is a copy of a letter sent by the Toronto solicitors for the Mond Nickel Company, Limited, to the chairman of the Select Standing Committee of the House of Commons on Mines and Minerals. The letter is self-explanatory:—

Feb. 4th, 1910.

The Chairman, Committee on Mines, etc.,
House of Commons, Ottawa, Ont.

Dear Sir,—We have communicated a synopsis of the allegations before your committee by cable to our clients, the Mond Nickel Company.

We are instructed to protest most emphatically against the statement that the International Nickel Company of New York controls all the supplies of Canadian nickel.

The Mond Nickel Company own their own mines in Canada, and do in this country most of the work required in producing nickel. The purchase money went into the pockets of Canadians, and the Canadian public has benefitted; for instance, one of their properties was purchased by them from the late Aeneas McCharles, who, with part of the proceeds, founded an endowment for research to be administered by the University of Toronto. Out of this fund an award was made the other day to a distinguished citizen of Ottawa.

Our clients have expended large sums in exploration for further ore bodies, but in addition to those which they acquired some time ago they have not been able to find new ore bodies which can be worked in competition with the rich nickel deposits of New Caledonia. At the present time our clients are producing nickel from their mines in Canada, and are supplying the British Government and the Indian Government with nickel mined, smelted, bessemerized and refined within the jurisdiction of His Majesty. About ninety per cent. of the entire wages are expended in this country. The completion of the refining is done in Great Britain, the nickel produced by them from Canadian ores being completely manufactured within the British Empire.

All well-informed persons know that the Sudbury District has no monopoly so far as the supply of nickel is concerned.

And, moreover, the use of nickel is very limited. Large amounts have been spent by nickel refiners in the effort to increase the use of nickel and to educate manufacturers as to the advantages of nickel steel, and notwithstanding these efforts, it seems impossible to enlarge the scope of the industry.

A large proportion of the nickel used at the present time comes from New Caledonia, and within the last few years new works have been started in Europe for refining New Caledonian ores. Besides these, Norway has also commenced to produce nickel again, and deposits of rich nickel ores have recently been discovered in Russia and other parts of the world.

Under these circumstances, to impose an export duty on nickel ore or matte would be to strike a severe blow against Canadian and British industry, and to favour the products of convict labour in the penal colony of New Caledonia.

The only Canadian director of the Mond Nickel Company was the late Sir George A. Drummond, whose loss will be regretted not only by this company, but throughout Canada and Great Britain.

We have asked the secretary of the committee for a copy of the evidence submitted, which we shall send to our clients in London so that they may have an opportunity of sending you a formal statement.

Yours truly,
CLARK, McPHERSON, CAMPBELL & JARVIS,
Solicitors for the Mond Nickel Co., Ltd.

Quebec, Jan. 25th, 1910.

Editor Canadian Mining Journal,
Sir:—

In the number of the Canadian Mining Journal of the 15th instant, I notice in Mr. Harpell's article on the Asbestos industry a statement, rather sweeping and unjust towards the Department of Mines, of the province of Quebec.

The article ends with the following sentence:

"The present Quebec Government cannot be held responsible for the condition of land holdings that exists around Thetford Mines and Black Lake, but they will be responsible for these conditions in new districts, such as Chibougamau **where they are creating a state of affairs no better than that created by their predecessors in the Asbestos district of the Eastern townships.**"

That large land holdings exist in the Chibougamau district, is inaccurate as regards both mining rights and surface rights, and allow me to correct the impression that the sentence conveys.

The Chibougamau district, by order in council passed in January 1907, was withdrawn from sale for colonization purposes. This means that no mining concessions, nor surface rights may be sold or disposed of without a new order in council being passed, throwing the district open.

Up to the present, only Mining Concessions applied for before the withdrawal from sale have been granted, and the area of these is altogether about 2,500 acres. The balance of the district, which comprises about 1,200 square miles is, at present, held by the government both as regards the mineral rights and the surface rights.

There are therefore in the Chibougamau district no large tracts of the "best agricultural lands held by one or two individuals" as the statement published in the journal seems to imply.

Let me state, Mr. Editor, that we always receive in the best spirit all well meant criticisms, and that we carefully note such for future guidance, but before making such condemnatory statements as the ones referred to above, it might be well to inquire as to the actual facts.

The Department of Mines of the province of Quebec is entirely at the disposal of any inquirer for information, and had Mr. Harpell realized the condition of the land holdings in the Chibougamau district, I am sure, he would have refrained from writing the last sentence of his article.

Yours truly,
Theo. Denis
Superintendent of Mines.

IN THE HIGH COURT OF JUSTICE.

Between Peterson Lake Silver Cobalt Mining Company, Limited, Plaintiffs, and Edward Steindler, D. M. Steindler and J. A. Jacobs, Defendants—Consent Minutes of Judgment.

It is hereby agreed by and between all parties to this action that judgment be entered by consent in the following terms:—

1. The defendants shall forthwith pay to the plaintiff company in full settlement of all claims the sum of $50,000, and shall also forthwith pay to the plaintiff company the further sum of $3,000 on account of its costs.

2. The defendants shall forthwith surrender to the plaintiff company 160,000 paid-up shares of the plaintiff company's stock by delivering up to the plaintiff company certificates representing the said 160,000 shares of stock accordingly.

3. The plaintiff company admits a liability to the defendants David M. Steindler and Jacob A. Jacobs of $28,291.10, and shall forthwith deliver to the said defendants in payment thereof two promissory notes for $14,145.55 each, bearing date the 19th day of January, 1910, payable in one and two years respectively from the date thereof, with interest at 5 per cent. from the said date.

4. The said defendants J. A. Jacobs and D. M. Steindler shall forthwith procure the dismissal of an action pending in this court against the plaintiff company, in respect of the said sum of $28,291.10, and the discontinuance of a like action and attachment proceedings in connection therewith, pending in the State of New York or New Jersey, in respect of the same matter, the said action to be dismissed or discontinued without costs, and the defendants will give such consents and do all such other things as may be necessary to release the moneys attached in said proceedings so that the same may be payable to the plaintiffs without costs or charges.

5. The defendants shall forthwith procure the dismissal without costs of an action pending in this court between Warren, Gzowski & Co., and the plaintiff company in respect of the transfer on the books of the plaintiff company of certain shares of stock of the defendants in the plaintiff company.

6. The plaintiff company shall rescind all resolutions barring or restricting the transfer of the stock of the defendants or any of them, and shall forthwith remove all restrictions in connection with the transfer of any such stock, other than such as are contained in the general by-laws of the plaintiffs applicable to all the stock of the plaintiff company generally.

7. The plaintiff company shall forthwith procure the dismissal without costs of an action pending in this court against the defendant Jacobs for an account and for other relief.

8. The judgment herein shall be without costs, except as hereinafter stated, and shall declare and adjudge that the above-mentioned payments and surrender of stock by the defendants shall be and be deemed to be a full and complete payment, satisfaction, settlement and discharge of all amounts payable by the defendants, or any of them, in respect of any and all of the capital stock of the plaintiff company heretofore at any time issued to the defendants or their nominees, or any part of them, and as entitling the defendants to receive all of the said stock at any time issued to or received by them or any of them or their nominees as

fully paid-up, non-assessable stock, and shall also be and be deemed to be full and complete payment, settlement, satisfaction and discharge of all claims against the defendants, or any of them, for misfeasance or otherwise in respect of the issue of any of the said stock or of any subsequent transfer or distribution or other disposal thereof, or in respect of the issue of any stock of the plaintiff company to any other person or persons whatsoever or in respect of any act or acts whatsoever of the said defendants, or any of them, as directors, promoters, agents or servants, or as director, promoter, agent or servant of the said company; and in full settlement, satisfaction, payment and discharge of all claims of the plaintiff company against the defendants, or any of them, for moneys, had, received or retained by the defendants, or any of them, and generally in settlement, payment, satisfaction and discharge of all claims and demands at law or in equity of every kind whatsoever by or on behalf of the plaintiff company against the said defendants or any of them.

Dated this 19th day of January, 1910.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay.—During the first half of January the output of the Dominion Coal Company's mines, was roughly 95,000 tons, which compares with an output of 85,000 in the first fortnight of January of last year. There was a slight falling off from the figures of December, due to the prolonged holidays taken by many of the men at Christmas. The daily output ranges round 9,000 tons, but it will not be until the end of January that the maximum will be obtained.

The announcement that Mr. M. J. Butler, C.M.G., had been appointed General Manager of both companies, was made at a meeting of the Coal Board on the 12th January, and on the 17th, Mr. Plummer, together with Mr. Butler and Mr. D. H. McDougall, the new Superintendent of Mines, paid a visit to the mines. Mr. Plummer had a conference with the three Divisional Superintendents of Mines and the Mine Managers, after which a statement was issued to the local newspapers by Mr. Plummer, which in part was as follows: "Mr. Plummer stated that he had not met the representatives of the United Mine Workers, and that he does not consider it necessary that he should meet them. The position of the Coal Company, as regards its employees has already been plainly stated in his telegram to the Sydney and Glace Bay papers, and a meeting with these representatives, even to discuss the terms on which the men, now out of employment may return to work, might be misconstrued, and regarded as a recognition of the United Mine Workers, which is against the policy of the company." This whole-hearted endorsement of the policy, hitherto pursued by the Coal Company towards the U.M.W.A, invaders has greatly pleased those whose duty it has been throughout the past six months to fight the various influences which have been brought to bear, to gain recognition for the United States organization.

At the time of writing, the Annual Convention of the U.M.W. is meeting in Indianapolis, and it may be that Mr. Lewis will have hard work to justify his actions and those of his representatives in Nova Scotia during 1909. Some of the Canadian newspapers which have supported Mr. Lewis in his campaign to gain control of all Eastern Canadian coal mines have recently hinted very plainly that the strike is lost, and further fighting on the part of the U.M.W. is futile.

One of the most significant facts that has transpired during the strike was given to the Halifax Morning Chronicle by Mr. John Moffatt, the Grand Secretary of the P.W.A., of Nova Scotia. On a recent visit to Pittsburg, Mr. Moffat discovered that at certain mines in Pennsylvania the miners are working under a reduced scale of rates, known as the "eastern rate," which it is explained, is necessary to enable the U. S. operators to capture the Eastern, or in other words, the Canadian market. Mr. Moffatt was shown affidavits in which it was stated that these special rates were paid under a "tacit understanding and private agreement" between the President of the Pittsburg Coal Co. and Mr. Tom Lewis, the President of the U.M.W.

The coal operators of Nova Scotia may well be pardoned if they consider the present condition of affairs a peculiar one, In 1909 the output of Nova Scotia was reduced one million tons, by the actions of the U.M.W. President in calling the several strikes. The importation of American coal was greatly increased by the same action, taken, it must be remembered, by the same labour leader who has the "tacit understanding and private agreement" with the head of a great U. S. coal company, that wishes to extend its coal sales in Canada. At the same time, action is taken in the Canadian Courts, charging the coal operators of Nova Scotia with enhancing the price, and with "unduly limiting the facilities for mining coal" in Canada. The costs of the prosecution are paid out of the treasury of the U.M.W. by the gentleman with the "tacit understanding and private agreement" with a U. S. coal company. The inference is too obvious to need elaboration. All this is being done by the irresponsible leader of an unincorporated foreign body, not amenable to Canadian Laws, for it is well known that there never would have been any strike in Nova Scotia, had it not been deliberately planned and brought about by the Executive of the U.M.W.A.

Glace Bay.—One result of the unfortunate strike brought about by the U. M. W. A. in Nova Scotia has been to compel many of the local miners to seek employment in other parts of North America, but these men do not seem to have found better conditions or more attractive remuneration in all their wanderings. Letters are daily received at the offices of the Coal Company from such widely separated addresses as Taber, Alberta; Nanaimo, Vancouver; from Illinois and Pennsylvania, and they all tell the same tale. The miner at Glace Bay has generally been certain of steady work and certain payment, but this does not appear to be an unvarying rule in the coal mines of other provinces and states. The more exact acquaintance with the workings of the U. M. W. A. which these men have gained by working in mines controlled by this union has cooled their enthusiasm as nothing else could have done. Many of these men are stranded and without the means to return to Glace Bay. There were numerous cases of good workmen who left Glace Bay when the strike was called, not because they sympathized therewith, but simply because they were men of peace, who hated a fuss, and dreaded the treatment to which those who attended their work were subjected. This class of miner was composed almost entirely of European nationalities, who felt little interest in the faction fight of two unions, accompanied by complications they did not understand, and they preferred to leave the town rather than be mixed up in the anticipated troubles.

Another class was made up of native miners, who, bitten with the western fever, thought the strike presented a favourable opportunity to see the country and work in those favoured provinces where the beneficent rule of Tom Lewis held sway. But all classes unite in a consensus of opinion, that Glace Bay and the Dominion Coal Company are hard to beat—and it is a

thousand pities that it should have proved necessary to travel so far afield and to lose so much to learn this lesson. If half the statements that these expatriated strikers made are true, the U.M.W. of America have little excuse for spending $600,000.00 in a forlorn and useless struggle in Nova Scotia, such time as conditions in the mines of their own country are the shame of a civilized community.

Whatever faults the town of Glace Bay may possess, a lack of variety is not one of them, and the recent municipal elections have furnished some amusing reading. The following excerpt will serve to show the extremely candid brand of criticism in which the local journals indulge. The Glace Bay Standard, which is the organ of the United Mine Workers of America, recently remarked as follows: "The officials of the Coal Company have never yet shown any ability in running the company's own business in any but an experimental and blundering manner; it has become the laughingstock of those who have an idea how such a concern ought to be administered. . . . Let the Coal Company's officials stick to their business, and perhaps, under the new teaching such as they are now getting, they may after a while learn something of their own business." This is a fair and average sample of the "journalese" with which the newspaper readers of Glace Bay have been regaled since the beginning of the United Mine Workers' strike.

The output of the Dominion Coal Company's mines for January was, approximately, 212,000 tons, which compares with 200,000 tons in the month of January, 1909. A comparison of the figures by collieries is as follows:—

Colliery No.	1909.	1910.
1	36,473	45,000
2	36,178	45,000
3	15,417	18,000
4	20,664	26,000
5	25,036	28,000
6	3,838	.....
7	9,255	6,000
8	12,882	10,000
9	22,605	17,000
10	13,634	11,000
12	4,194	4,000
14	.....	2,000
Total	200,176	212,000

The outputs during the first half of the month were much disorganized by the Christmas holidays, but they recovered towards the end of the month, and during the last week the output maintained an average of 9,330 tons per day.

It is apparent and has been apparent for a long time that the so-called "strike of the United Mine Workers" has failed, and it is difficult to know what justification this organization has for its expenditure to maintain the pretence of a strike in face of the foregoing figures.

Mr. Duggan's departure from Glace Bay and his retirement from the active management of the Dominion Coal Company gave occasion for a gathering of a significant character. Mr. Duggan was waited upon by a committee, which included representatives from all the lodges of the Provincial Workmen's Association at the mines of the Dominion Coal Company, who presented him with a very tangible token of their esteem, and expressed their regret that Mr. Duggan was leaving Glace Bay. This committee represented some 3,500 workmen of the Coal Company, and the address which was read referred to Mr. Duggan's good faith in every negotiation he had had with the workmen under his charge, and was, in fact, a tribute such as is rarely given to an official of a large corporation by workmen. The number of men who have followed the mistaken lead of the United Mine Workers' organizers does not, at the outside, exceed 1,700 men. To the unbiased observer, matters in Glace Bay must seem a little topsy-turvy when a disgruntled minority of workmen, aided by the funds of a labour organization with headquarters in the United States, is allowed to intimidate the great majority of the workmen who desire nothing better than to attend to their work and manage their own business in the way that seems best to themselves. It may not be realized that this small body of strikers has for seven months held a carnival of coercion and intimidation throughout the colliery districts, which is costing the peace authorities and the Coal Company a large expenditure of money, and blocking the wheels of industrial progress in a manner unprecedented in Nova Scotia. It is one of the basic principles of British politics that a minority has rights, but by no stretch of the imagination can a minority of workmen have the right to act in the manner in which the United Mine Workers of America have acted since the 6th of July, 1909.

ONTARIO.

Cobalt.—It is understood that a 51 per cent. interest in the Provincial mine has been sold. The mine has been incorporated in a company known as the Cobalt Provincial Mining Company. This property was bought at the last sale from the Provincial Government.

The new road into the South Lorrain camp is practically completed. It leaves the Kerr Lake road at the Lumsden mine, near the Rochester, and goes through the Pan Silver, John Black, Ophir, Highlands, and Ontario Development Company's properties. Stages are now running over the road, and the trip into the Keeley mine can be made in three hours. This road will be of great benefit to Cobalt, as formerly the only way to get into the district was by way of Haileybury. The Mines Power is making preparations to deliver cheap power to the district, and is building a substation on Beaver Lake, and when it can deliver power, mining costs will be much reduced. The present year should see several mines added to the list of shippers. The Keeley and Wettlaufer are certain, while the chances are excellent for the Little Keeley, Beaver Lake, the Newman, and Maiden Companies. The Beaver Lake Company has discovered silver in its big smaltite vein at a depth of 135 feet. The vein was very wide on the surface and in the shaft, but the silver values were low. In drifting on the vein, however, on the 135-foot level leaf silver was encountered. The Keeley is the oldest property in the camp where values were found. The company has so far been labouring under a serious disadvantage, as the gas producer plant that it installed has given it a great deal of trouble. Another gas producer plant has been ordered to run a ten drill compressor. The company has on hand about half a car of high-grade ore that will run high in silver. The shaft has been sunk to the 140-foot level, and drifts are being run on the vein. At the 65-foot level a cross-cut has been started to cut No. 2 vein. There is also a shaft down 75 feet on No. 3 vein, but no work has been done on this for some time. The Beaver Lake has, however, found silver in this same vein at greater depth, so the possibilities for the Keeley finding it are also good. Up to date this property has shipped a little over forty-four tons of ore. For some time past it has been known that Adolph Lewisohn, who controls the Kerr Lake mine, has been negotiating for control of the Wettlaufer. This he was unable to get, but he has acquired a large interest. The Lewisohns are not, however, in the habit of being contented with minority interests, so that it is fairly safe to assume that this is only a preliminary to acquiring control. The Wettlaufer Company is capitalized at $1,500,000, and when the stock was first put on the market it was sold for 45 cents, and less than a year ago 150,000 shares of treasury stock were sold at that price. When it was known that the Lewisohns had invested heavily in the property the stock sold as high as $1.42 per share. This mine has had high-grade ore from the surface, and the first carload that was taken out from development work more than paid all the initial expenditures on the property. The shaft has now been sunk about 140 feet, and there is high-grade ore in

the bottom. There are two levels, and over 500 feet of drifting has been done. Up to date two cars of high-grade and two cars of medium grade ore have been shipped.

The Cobalt Lake mine is coming to the front on account of the shipments of high-grade ore that have lately been made, and on account of the better physical condition of the property. The new vein, known as the Pellatt, is showing good values, and has now about five inches of high-grade ore. It has been decided to continue the winze from the 190-foot level to a depth of 250 feet. From this depth a cross-cut will be run to cut the Pellatt vein.

It has been denied that the Bartlett has reverted to the original owners, McLaughlin and McIntyre, but it is understood that when work is again started these men will be directly interested in it. The Bartlett will now have a chance to make good when operated under conservative management. The property is one of the best located in the Gowganda District, and the surface showings were exceptionally good. However, under the previous management no trenching or surface prospecting was done. The company is unfortunately cursed with a high capitalization.

Active development work is now being carried on at the Drummond mine, and they are cross-cutting on the 200-foot level under Kerr Lake in an effort to reach the conglomerate. The Hargraves opened up a good vein some time ago in the vicinity of the Drummond boundary, and it is probable that the latter company will recommence prospecting in that vicinity. About two years ago they sank a shaft on a small vein close to this point, and when the values pinched out the working was abandoned. This company still continues to make large shipments from the dump to the Trout Mills concentrator, and it is understood that the rock is assaying higher than was anticipated.

The big Peterson Lake and Steindler and Jacobs suit has been settled by arbitration. All through the action Justice Teetzel advocated a settlement, and gave it as his opinion that the suit was so complicated that he doubted his ability to render a satisfactory judgment. After a good deal of discussion the interested parties decided to leave the matter in the hands of the judge. Steindler and Jacobs are to pay $50,000 in cash and surrender 16,000 shares of stock, besides contributing $3,000 to the costs of the action, while the Peterson Lake Mining Company will pay Steindler and Jacobs the sum of $28,000 in two years. The independent suit against Mr. Jacobs has been withdrawn, also the claims for stock alleged to have been improperly issued. The question of the location of the lease has yet to be settled by the courts.

Another ore shoot has been discovered on the 200-foot level of the Crown Reserve about 350 feet west of the No. 1 cross-cut. It has been drifted on for over 15 feet, and shows high-grade ore. This company is in an excellent condition financially, and after paying all dividends has a surplus of approximately half a million dollars.

Already this year four companies, the T. & H. B., Crown Reserve, Nipissing and La Rose, have paid a total of $888,457.50 in dividends.

The new Trethewey shaft being sunk at the northern extremity of the property is about completed, and will soon be in shape for timbering. This shaft is being sunk to work the veins developed by the Hudson Bay. The latter company also put up a raise to meet the shaft, thus much reducing the time necessary to carry out the work. The new shaft is being connected with the mill by an incline tramway, and the cars will be run with a small hoist. Good progress is being made with the mill, which will probably be finished before the power is ready. The stamp batteries are in place, and a large part of the other machinery is on the ground, and is being rapidly installed.

The position of the King Edward has much improved since the mill started running. It is probable that in the future the shipments will average nearly a car of mixed high-grade ore and concentrates a month.

It is reported that a rush of some proportions has started to Fort Matachewan, which is about forty miles north of Elk Lake. Some good specimens of gold-bearing quartz have been brought down.

The road from Latchford to Maple Mountain has been opened up, and supplies have already started in over it.

With their 2 per cent. dividend cheques the La Rose sent out a brief financial statement. It reads as follows:—

Cash in bank, ore in transit and at smelters	$335,828.97
Ore sacked at mine ready for shipment	46,810.00
	$382,638.97

Up to date the La Rose has disbursed to shareholders dividends to the amount of $1,379,279.00. It is interesting to compare the above statement with that of the Nipissing, as these two properties are the principal ones in the district. During 1909 the increase in tonnage over 1908 was 3,005 tons, and the cash surplus was $402,510.34 more, while the increase in dividends paid amounts to $660,000. In addition to this it is stated that the ore reserves are greater than at any time in the previous history of the mine. The statement of January 1st, 1910, is as follows:—

Cash in bank	$819,223.86
Ore in transit and at smelters	413,033.64
Ore sacked at mine ready for shipments	90,728.00
	$1,322,985.50

The 1909 dividends, including the one payable January 20th, 1910, amounted to $1,500,000.

In 1909 the company shipped 6,510 tons of ore, valued at, net	$2,210,364.00
In 1908 the company shipped 3,505 tons of ore, valued at, net	1,263,783.00
Increase, 3,005 tons, net increase	$946,581.00

The Nipissing has been steadily improving its position, and it is expected that vein 122 will take the place of the Kendall as the principal producer. Some exceedingly fine ore is also being taken out of No. 64, which is a continuation of one of the Hudson Bay veins.

A notice sent to the shareholders of the Beaver advises them that the second carload of ore shipped gave a net return from the smelter of $47,948.81.

A consignment of silver bullion amounting to 29,000 ounces was shipped recently direct from the O'Brien Mine to Mocatto & Goldsmid, bullion brokers for the Bank of England.

The third carload of silver to be shipped from Gowganda was sent out recently from the Reeves-Dobie mine. The other shipments were made from the Blackburn and the Reeves-Dobie. The ore was sent out from the mine to the end of steel on the Canadian Northern, and the trip only occupied a little more than a day. It is understood that the Mann and the Boyd-Gordon will also shortly ship a car, while more may be expected from the Reeves-Dobie.

The Right of Way has cut a new high-grade vein from their No. 3 workings between the Silver Queen and the McKinley-Darragh. The vein was discovered on the 120-foot level, and shows about four inches of ore that will run in the neighbourhood of $2,000 of silver.

Mr. E. T. Corkill, Inspector of Mines for Ontario, has laid information before the magistrate against the Goodwin Mines, alleging negligence and non-compliance with the Mines Act in connection with the death of one of the workmen a short time ago. The case comes up February 4th, and will be the first of its kind for over a year. The penalty is between $100 and $1,000.

The report that the O'Brien option on the Gillies and Miller claims in the Porcupine had been abandoned came as a great surprise. It was known that Mr. O'Brien was endeavouring to get an extension of the option, and it was understood that he

had been successful, but a few days afterwards all work was stopped. Particular interest was felt in this option, as it was on these claims that the diamond drill was working in an effort to cut the vein at some depth. When the drill was first started and was down a short distance it was figured that it would take a 600-foot hole to cut the vein, so that hole was stopped and another one started at a lower angle. Before this was down very far, however, the option was abandoned and the drill stopped. It is understood that the owners had several good offers for the property, and were not content to extend the option without a large part of the initial payment of $50,000 being made. Encouraging results are being obtained from the Hollinger properties, which are under option to the Timmins. The main vein can be traced for over 1,000 feet, and the shafts that are being sunk show that the values are going down as far as the shafts have been sunk. When a depth of 50 feet is reached cross-cuts will be run to cross the veins and prove their values. On the claims owned by McArthur & Co., of Glasgow, Scotland, the main energies of the management have so far been directed toward the erection of camp buildings, and as soon as these are completed several shafts will be sunk. It is reported that McCormick Bros., of New York, have purchased the Wilson claims. This property, which consists of eleven claims, is generally conceded to be the best in the district. Some time ago Mr. A. A. Cole, engineer for the Temiskaming & Northern Ontario Railway, made a report on the district.

It is not expected that the phenomenal values found in some places will hold, but it is hoped that the values in the veins will average up to make a good low-grade proposition. Engineers are confidently looking for the appearance of sulphides with greater depth.

The annual report of the Hargraves was very encouraging to the shareholders, as it showed a cash balance of over $30,000, and ore on hand to the value of $10,000. The property is looking better than at any previous time in its history.

The Nancy Helen mine has been closed down for an indefinite time. The power plant has been leased to the Cobalt Light Company until the 1st of March.

The Otisse-Currie and the Gavin-Hamilton properties in Elk Lake have assigned. It is understood that there is a likelihood of a settlement being effected and of work being resumed.

Following the starting up of the Colonial mill, that property has shipped a car of ore for the first time in over a year.

BRITISH COLUMBIA.

Rossland.—The local mining situation remains steady and unchanged, with the exception of the recent leasing of the Mayflower mine in the South belt. A good ledge of pay ore has been uncovered in No. 3 tunnel on this property, and Mr. N. Hansen, the lessee, expects to begin shipping on a small scale in a short while. A crew of five men is now at work on the property, and an ore chute from the tunnel to bins near the railway track is being built.

The Le Roi 2, Ltd., is quite active, and is preparing for operations on a larger scale than at present. This concern is asking figures on an electrical hoisting apparatus to replace the present 150 h.p. hoist at the Josie headworks. Preparations are also being made to explore that area of ground north of the No. 1 shaft. Some of the finest copper ore ever produced in this camp has been mined in the No. 1 workings, which are about 650 feet deep. This part of Le Roi 2 property has not been worked for some years. The cross-cut on the 1,300-foot level of the Josie has been driven 100 feet toward the ore zone, and work on this level will be energetically continued.

The Le Roi continues to ship a moderate tonnage each week. Nothing new is heard from the ore discoveries made in the lower levels with diamond drill, but it is understood some indications of good ore have been located. The Consolidated Centre Star-War Eagle group is shipping nearly four thousand tons per week, and development in the lower levels is yielding a big tonnage of ore.

Resolutions affecting the mining industry, that will be placed before the Associated Boards of Trade, in convention at Nelson, January 25th, will include one from the Rossland Board, that the Government of the Dominion of Canada be requested to coin silver dollars at the Mint in Ottawa. Men interested here would like to see this adopted for two reasons. It would mean an increased use of the .999 fine silver produced at the Trail refinery, and it would probably retire some of the filthy, germ-laden bills now in circulation. A quasi-radical resolution will be considered suggesting the abolition of the present personal tax on merchandise, machinery, stock, etc., carried for the conduct of business. It seems that some of the men connected with the Government have hinted that this tax might be abolished when the finances of the province were in a flourishing condition, and there were good days ahead. As things look now, it is thought that the time is about ripe for a consideration of this measure.

The following change in the Mineral Act will become law on April 1st: "The owner or agent of owner of a mineral claim for which the mining recorder's certificate, under Form 1 of the schedule of this Act, has been granted, shall within three months from the date of such certificate, make application to the Gold Commissioner for a certificate of improvement, and in default of such application being made in such time, such mining recorder's certificate shall lapse and become absolutely void." It seems that there has been much delay in applying for the certificate of improvement in the past, and this measure will overcome that by constraining the owners of mineral claims to prompt action within the specified three months.

The Boundary.—The action of the Granby Consolidated, to sell 13,500 shares of its treasury stock, is looked upon with favour here for several reasons: The amount derived from the sale of this stock ($1,147,500) even at the preferred figure to present shareholder of $85 will be more than sufficient to pay off the indebtedness of the company incurred in the purchase of stock in the Crow's Nest Pass Coal Company. Then it is stated by the Granby officials themselves that as there will be no improvements of such magnitude as undertaken last year, a more substantial dividend may be paid than was the case in 1909 (2 per cent.), provided, of course, things remain normally favourable and no disastrous labour or fuel trouble crops up, which possibility is most remote at this writing. The Granby is maintaining a good average in ore shipments, and for the first three weeks of this year has sent 78,532 tons to its Grand Forks smelter, where seven furnaces are working now, one of the battery undergoing some minor repairs. This average maintained for the last week of the month will mean a production of 2,303,500 lbs. copper for the first four weeks of the year, as Granby ore will average nearly 22 lbs. copper per ton and under $1 in gold and silver. It is thought the Granby will pay from 5 per cent. to 8 per cent. in dividends this year, under favourable operating conditions.

There is not much fear of work being suspended at the mines and smelter of the B. C. Copper Co. over the threatened labour difficulty now that a board of arbitration has been called for under the Lemieux Act. Some phases of the demand of the miners' union for "closed shop" are ridiculous to fair-minded men, and they are not receiving the support they would get were their grievance founded on more substantial ground. The net profits of the B. C. Copper Co. during December last were about $22,700, and the cost of making the red metal per pound was 10c, as compared with 7.35c in November. This was partly caused by the several holidays and inclement weather interfering with surface mining. Shutting down a big mining and smelting concern easily runs up costs and is quite expensive, though it be but for a day or two. For the first three weeks of the year the B. C. Copper Co. has shipped 29,745 tons of ore from its Mother Lode and Oro Denoro mines.

The Golden Eagle, on the west fork of Kettle River, shipped 120 tons of ore to Granby smelter during the past week. The mine has closed down temporarily. The Riverside property has been purchased by a local syndicate, and work will be started along development lines shortly.

Nelson.—A substantial tonnage of high-grade ore is being sent to the smelter from the Slocan, Nelson and East Kootenay mines, and several new properties have joined the shipping list already this year. The outlook for the coming season is cheerful. There is a good tonnage of ore blocked out in the Ottawa, at Slocan which is under lease. A 14-foot vein of ore is being worked in the Standard, Silverton, and shipments are being made. A force of over 100 men is now employed at the Van Roi, where about 150 tons of ore per day is being milled. The Silverton Mines, Ltd., is working the Hewitt and Lorna Doone property. The Molly Hughes shipped 59 tons of ore last week, carrying a quantity of native silver.

An ore body has been opened up in the lower tunnel of the Lucky Jim, carrying from 52 to 53 per cent. zinc, which is considered a rich find. The property is temporarily shut down at this time.

A party of French capitalists, who are interested in the Blue Bell mine, being operated by the Canadian Metal Co., visited the property last week. As a result of this visit it is hoped that the production at the mine will be doubled. With this end in view, steps are to be taken toward the improvement of the reduction plant at Riondel. The zinc reduction problem in this district is a profound problem, but now that the attention of the mining public is centering on it, there is no doubt that steps will be taken toward its solution.

It is reported that the face of the 360-foot tunnel on the old North Star mine is in ore carrying 60 oz. silver and 40 per cent. lead. Development is now being undertaken to prove the value of the strike.

Vancouver.—It looks as though something definite is to be done at last with the British Columbia iron deposits. Recently J. A. Moore, president of the Irondale Smelting Co., invested $60,000 in coal lands on Graham Island, and states that it is intended to erect a steel plant on the coast that will cost from a half to a million of dollars. This plant will very likely be on Vancouver Island, where extensive iron deposits have been found. The same concern has invested $75,000 in the magnesite beds of Atlin. This mineral ($MgCO_3$) is not common, and this deposit is probably the only one of the same character on the continent. One of the uses of magnesite is as a refractory material for linings for the converters used in the basic Bessemer process for making steel. The deposit behind Atlin was bought as an investment.

The Red Cliff Mining Co. now has its boiler and compressor plant at the mine, and will shortly begin the installation. Extensive work is planned for the coming season at Portland Canal. The O. H. fraction near the Portland Canal group has been bonded for $75,000, and will be worked immediately. There are several rich veins on the property. The owners of the Britannia are spending about $30,000 per month in development and equipment, and the property is rapidly coming to the front.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—The coal boring operations in Prince Edward Island which have been in progress for nearly two years, have been concluded. The work has not brought the results which all have so earnestly hoped for. The last borings made were at Miminigash, where a drill had been sent down to a depth of seventeen hundred feet. Work here was brought to a sudden termination a few days ago by the fact that there was a cave in of about one hundred feet of the upper earth, which buried the apparatus and knocked on the head all possibility of continuing the work at that place.

Sydney, Jan. 28.— The present winter up to the present has been one of the mildest experienced here in many years, and shipping men look for an early opening of navigation.

Not since 1902 has there been so much activity in Dominion Coal Co. shipments as there is this winter. The coal carrying capacity of the fleet now in operation is 34,300 tons, as against 16,000 tons last winter.

The above figures represent dead weight capacity. As almost the whole of the coal shipped goes to Halifax, St. John, Portland, or Boston, the steamers of the Coal Company's fleet are able practically to make weekly trips. Fully half the amount shipped for this winter has been from the Sydney piers.

The company looks forward to a very busy season in coal shipment during the coming summer, and is making preparations at the collieries accordingly.

QUEBEC.

Montreal. Feb. 9.—The last hope of the U. M. W. of America was shattered to-day when President Plummer of the Dominion Coal Company refused to meet a delegation of high officials from that order to discuss the Glace Bay strike.

Mr. Plummer absolutely declined seeing the delegates, sending Hector McInnes, K.C., the company's solicitor, to tell them that such a conference would be useless, and would give rise to misconception and misunderstanding; and also for the reason that his policy had already been announced, and that there was no possibility of a change.

Thetford Mines, Que., Feb. 3.—The very mild winter has been a great boon to both Thetford Mines and Black Lake, in as much as it has permitted the Amalgamated Asbestos Corporation to carry forward very extensive plans for improvements and extensions, and the progress already made on the larger contracts indicates that the company will be able to increase its output materially in the near future.

ONTARIO.

Cobalt, Feb. 2.—Sandy Christie and Jas. Hope, two miners, were blown to pieces on Monday afternoon in the shaft of the Silver Leaf mine.

The two men went down the shaft about three o'clock to load some holes. The dynamite had been packed in and the fuses set. Hope lit one fuse and before he noticed anything wrong he started a second.

Some loose powder had evidently been left near the hole for the flame from the end of the fuse leaped to the powder and an explosion followed immediately.

After the second hole had gone off other men ventured down and found the two bodies terribly mutilated.

BRITISH COLUMBIA.

Greenwood, January 26.—Once more work on the great tunnel to Phoenix is in full swing. The newly installed drill compressor started at 9 o'clock on Wednesday morning last. Two hundred and twenty-six feet was driven by hand, and now the rate of progress with the drills will be very much accelerated. There are 22 men employed, superintendent, 8 miners, 9 muckers, 2 compressor men and 2 blacksmiths. The complete equipment is now ready for continuous work and the management expects to make from 12 to 18 feet per day.

Queen Charlotte, B.C., January 27.—News is just to hand from the camp between Massett and the Yakoun that the diamond drill at work there has struck a large body of coal.

Three seams of excellent coking and steam coal are reported, the largest seam being 9 feet 6 inches at 600 feet below the surface.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

It was finally agreed at a meeting of owners and miners in Newcastle-on-Tyne, on January 15th, that further meetings should be held between the men's representatives and the managers at the individual collieries, with a view to endeavouring to arrive at a settlement on the lines of the conversation that had taken place that day between the representatives of the two associations.

The South Wales and Monmouthshire Coal Trade Conciliation Board continued negotiations at Cardiff, January 26th for the drawing up of a new agreement between the coal owners and the miners. Both sides were chiefly engaged in holding separate conferences for the purpose of deciding upon their future course of action, and so much time was occupied in this manner that it was decided to adjourn the discussion on the most important questions until today, when the chief topic will relate to the minimum and maximum wage difficulty. It is expected that both parties will put forward modified proposals.

GERMANY.

Notwithstanding economic depression prevailing during the greater portion of 1908, the production of coal in Germany in that year reached record figures. It amounted to 148,966,000 tons, as compared with 148,621,000 tons in the preceding year, or an increase of 345,000 tons, and the output of lignite, or brown coal, totalled 68,355,000 tons, as against 66,450,000 tons, being an increase of 1, 905,000 tons. The imports of coal in 1909 amounted to 12,198,000 tons, as contrasted with 11,661,000 tons in the previous year, or an increase of 537,000 tons. On the other hand, the exports of coal were 23,350,000 tons, as against 21,190,000 tons in 1908, being an advance of 2,160,000 tons. The total consumption of coal in Germany amounted to 137,814,000 tons, as compared with 139,091,000 tons in 1908, thus showing a falling off of 1,277,000 tons.

Berlin, January 15th.—The "Tageblatt" points out that, in consequence of the introduction of the miners' eight hours' day in England, the British steel and iron manufacturers have been obliged to raise their prices, thereby enabling their German competitors to raise their prices, which had sunk to a very low level. Since then there has been a genuine revival in the home markets, so that the German iron and steel industry is able to count on an active trade and higher prices. As a result of the coal strike, a number of iron works in the north of England are closing down, and if the strike is protracted great advantages will certainly accrue to the German coal and iron industries. The "Tageblatt" points out that as a consequence of the cessation of the importation of British coal the German consumer will be compelled to pay higher prices for German coal, and concludes, therefore, that in the general interest it cannot wish for a protracted strike in England.

AUSTRALIA.

Sydney, January 15th.—The ballot among the Southern miners has resulted in favour of the acceptance of the award of the Wages Board.

Sydney, January 25th.—The position of the Northern and Southern miners remains unchanged. The judge on the Northern Compulsory Board has determined to proceed to compel the attendance of witnesses. The s.s. "Quito," the first government coal ship, is expected to arrive to-night from Calcutta. Free labourers have been engaged to unload her. The Crown is prosecuting nine miners at Maitland for obstructing workers in the local colliery.

NEW ZEALAND.

New Zealand is likely to become an important oil producer at no distant date, and extensive prospecting operations are in progress. An area some 300,000 acres in extent, near Gisborne, in the North Island, has recently been taken up, and will no doubt shortly be the subject of a prospectus. From other parts of the world comes news of active operations, and among pending flotations are the Timor Oil Fields, which is being formed to acquire property in the Dutch East Indies, while a concern having interests in Madagascar is also expected to make its appearance shortly. In California a great demand for oil lands is reported, but the supply has now become very limited. Favourable reports are to hand from Angola and the Portuguese territories of West Africa.

RHODESIA.

Rhodesia, like the Rand, managed to create a fresh record in its gold output for the past year, but, also like the Rand, it did not make so much progress as in 1908. The total production of £2,624,000 in 1909 was an increase on the previous best in 1908 of nearly £100,000; but, on the other hand, 1908 gained as compared with 1907 nearly £350,000.

CHINA.

The directors of the Pekin Syndicate announce that the output and sales of coal for the month of December were:—Output, 23,350 tons; sales, 30,000 tons; boiler consumption, 1,850 tons.

UNITED STATES.

Primero, Colorado, February 1.—Of the 150 miners employed in the Primero colliery of the Colorado Fuel and Iron Company, fully one-half are victims of a gas explosion that took place this morning at 4:30 o'clock. Both fans were shattered by the explosion. It took three hours to repair them. 24 bodies have been already taken out by rescue parties equipped with breathing helmets. One miner was rescued alive. Numbers of miners volunteered to aid in the search. The work of superintendent J. F. Thompson was notably heroic. He was twice overcome by gas.

Ely, Nev.—The work of retimbering the new shaft of the Giroux company is progressing at the rate of 15 feet a day, which insures the completion of the shaft not later than the middle of March. Sinking has been commenced from the bottom of the shaft and will be continued, it is said, until the 2,000-foot level has been reached.

The Giroux shaft is 18 x 10 feet, inside dimensions. There are five compartments, one 10 x 6 for a bouble-decked cage which is to handle men and timber. Thirty-five men can be taken at a single trip and a car of 9 x 6 timber can be run onto the cage, lowered to the point desired, and then run off on the level, without any shifting. There are two skip roads each 4½ x 5 feet and the rest of the shaft is taken up with ladder and pipe-ways cut up to the best of advantage. A platform running on guides will be provided for pumpmen and pipemen, so that inspection of these lines may be made readily and properly and new lines added as may be needed.

Cherry, Ill., February 1.—Work was resumed in the St. Paul mine to-night by scores of men, following the removal late to-day of the hermetic seal that had kept the mine closed for two months. Efforts will be made to clear the mine of noxious vapors, wall-in any smoldering fires and recover the 160 odd dead bodies of miners who have lain entombed since the fire of November 13th.

Mine experts in oxygen helmets descended 350 feet to the bottom of the shaft and reported that an unprotected man could not live a minute there. Accordingly, efforts are now being directed to clearing the mine of poisonous gases. No one will venture to estimate when the bodies can be removed.

COMPANY NOTES.

It is announced that the quarterly dividend of 3 per cent. due February 1 has been passed by the directors of the Coniagas Mines Company.

Last quarter the dividends were recommenced, the previous quarterly payment having been passed to admit of a concentrator being built.

B. C. Copper Company's Earnings.

The British Columbia Copper Company, in its fiscal year ended November 30th last, earned 10 per cent. on its capital stock, which prior to increase amounted to $2,515,000.

Coal and Coke Company Meeting.

The annual general meeting of the Western Coal and Coke Company will be held February 14, in Montreal. Books will be closed from January 31 until after the meeting.

Coal Pfd. Dividend.

The Dominion Coal Company has declared the regular half-yearly dividend on the preferred stock of 3½ per cent., payable February 1, to stockholders of record January 21.

CROWN RESERVE MINING COMPANY, LIMITED—REPORT OF THE GENERAL MANAGER.

Cobalt, Ont., 25th January, 1910.

To the Directors:

Herewith follows report of the operations of the company for the year ending December 31st, 1909.

Mine Development.

The No. 1 cross-cut was driven across the lake to the north boundary, and cut vein No. 14, besides several small stringers. About 365 feet north of the shaft the diabase was encountered; no veins were cut beyond this point. This cross-cut proved, however, that the diabase was farther north than expected, due to the northeasterly dip of the conglomerate, giving the property a greater area of the vein-bearing conglomerates with depth than was expected. The No. 2 cross-cut was driven 536 feet and then stopped, as it was considered dangerous to go farther on this level because of water. This cross-cut exposed veins Nos. 15, 17, 24, and others. A solid concrete wall was put in the face of this cross-cut, and at present the development of this cross-cut is being done by means of a flat diamond drill hole, which is now in 315 feet. Silver assays were obtained between 191 feet and 195 feet, although we were unable to get the cores at these points. (Since January 1st another vein has been struck at 420 feet.) The practice of installing heavy doors in concrete frames was continued, so that any portion of the mine can be isolated, practically eliminating any chance of danger to the mine from water.

In all, 24 veins were exposed by cross-cuts Nos. 1 and 2, although some of them may prove to be stringers of the same veins. The most important veins, besides the Carson vein, are Nos. 2, 14, 17 and 24.

Carson Vein.—On the Carson vein the east and west winzes were sunk to the 200-foot level, and then connected by a drift. This vein did not have any particular change until the 165-foot point in the west winze and 175-foot point in the east winze were reached, when the Keewatin was encountered and the vein became smaller and more shattered, and the values decreased somewhat; the vein, however, still shows good values at the 200-foot level, and in one place it is about 9 inches in width and assays 4,700 ounces. Besides this there is good milling ore for about 4 feet adjoining the rich ore. However, it cannot be said that the vein at this level is as phenomenal as it was in the conglomerates above, although it is better than the average high-grade vein in the Cobalt District. The east winze at the present time is being sunk from the 200-foot level to the 300-foot level, and shows the vein strong at the bottom at a depth of 225 feet. In the development work on this vein about 800,000 ounces were obtained, and stoping on this vein during the year produced 2,750,000 ounces.

No. 2 Vein.—The No. 2 vein runs about east and west, and is about 25 feet north of the Carson vein. It averages about 3 inches in width of heavy smaltite ore assaying about 3,000 ounces. This vein has been stoped for a length of 115 feet and a height of 15 feet at the 100-foot level, the stope producing approximately 70,000 ounces.

No. 14 Vein.—The No. 14 vein when cut was about 3 inches in width, and assayed about 6,000 ounces, but the shoot of this ore was only about 20 feet in length and then ran into smaltite ore assaying about 200 ounces. This vein has been drifted on for 300 feet, but only stoped for a length of 90 feet and a height of 10 feet, the ore in the stope being quite spotty. About 30,000 ounces has been taken from this stope.

No. 17 Vein.—The No. 17 vein when cut was about 4 inches in width, and assayed about 4,000 ounces. The vein was drifted on in a northwesterly direction for 80 feet, showing continuous rich ore, which then split up into two stringers running parallel to each other, one being 2 inches and the other 1 inch in width, and each assaying about 3,000 ounces. A winze was sunk to the 200-foot level, and shows continuous ore for the whole depth, averaging 4 inches in width, and assaying 4,000 ounces. At the 200-foot level this vein was drifted on for 150 feet, and shows rich ore from 1 to 6 inches in width. With the exception of the Carson vein, this is the most important vein at present discovered. In the development work alone it has produced 250,000 ounces, and no stoping has been done at the 200-foot level. There is ore blocked out on three sides 100 feet high and 150 feet long. The most significant fact that the development work on this vein has proved is that the ore and values at the 200-foot level are better on this vein at least than on the 100-foot level.

No. 24 Vein.—Vein 24 is 60 feet east of vein No. 17, and runs almost parallel to it. The ore is from 2 to 4 inches in width, and averages over 4,000 ounces. A drift was run at the 100-foot level for 130 feet in continuous rich ore and a stope about 5 feet high was taken out above it. At present a winze is being sunk from the 100-foot level to the 200-foot level, and it is now down 15 feet, and shows about 4 inches of rich ore at the bottom. This vein has produced about 150,000 ounces, practically all taken from the 130 foot drift and the small stope.

Besides these veins, there are others that are still undeveloped and that will more than pay for the cost of developing them, and some will undoubtedly show very substantial profits.

The mine plans accompanying this report show all underground work in detail.

Total Mine Development.

	1909. Feet.	Total. Feet.
Sinking and raising	465	705
Drifting	1,539	1,825
Cross-cutting	2,042	2,402
	4,046	4,932
Stoping in cubic feet		105,050
Stoping in square feet of vein area		12,470

Plant and Equipment.

During this year we added quite materially to our plant and equipment, as we found our plant of last year inadequate. The new buildings include a bunkhouse 56x36 feet, for the accommodation of 125 men, and an addition 24x26 feet to the dining-room, so that this will now accommodate 200 men at one sitting; storehouse 35x25 feet; carpenter shop 45x30 feet, equipped with a band-saw and buzz-planer; and an addition to the office,

24x18 feet. The powerhouse was made larger, and another 100 h.p. boiler installed, also a twenty-drill compressor in place of the six drill machine. We replaced the hoist with a larger one capable of lifting a load of 7,000 lbs. at 300 feet per minute, and added a 20 kilowatt dynamo, besides fire pumps, condensers, etc., so that our equipment is of the highest efficiency necessary for the development of this property. We also erected six double and five single houses on the property of the Imperial Crown Mines, Limited, who granted us a lease for this purpose. These houses are occupied by our married employees, and will pay for themselves in rental in five years.

Ore Production.

The total production for the year 1909 was 4,034,325 ounces of a gross value of $2,080,156.08 produced from 3,092 tons of ore, as compared to the production of the year 1908 of 1,798,954 ounces of a gross value of $910,350.62 produced from 650 tons.

The total production in detail follows:—

	Weight.
High grade	1,513,895 lbs.
Low grade	4,664,578 lbs.
Bullion	76,152 ozs.
Total	3,093 tons

Ounces Silver.	Gross Value.	Freight and Treatment.	Net Value.
3,622,029	$1,867,509.22	$126,609.83	$1,740,899.39
346,085	176,820.64	56,190.26	121,630.38
66,211	35,826.22	2,871.07	32,955.15
4,034,325 ozs.	$2,080,156.08	$184,671.16	$1,895,484.92

Average Value of Ore.

	Ounces per ton.	Value per ton.
High grade	4,784.7	$2,466.96
Low grade	184.4	75.81
Total	1,304.6	$672.66

Bullion, 869 thousand fine. Average price received for silver was 51.56c.

Cost of Ore, 1909.

Smelter charges and deductions	$184,671.16
Ore handling and marketing	39,984.31
Mining and development	97,717.74
Power and light	29,826.67
Maintenance building, plant and equipment	13,664.10
Mine, general expense	19,389.31
Superintendence and travelling	12,332.00
Head Office expenses	4,225.46
Depreciation at 20 per cent. on B. F. & E.	14,330.15
Total	$416,140.90
New buildings, plant and equipment	$65,403.26
Total cost of silver per ounce	1031c

This shows a net profit of 41.25c per ounce, or a total net profit of $1,664,015.81 for the year. This is equivalent to 83.20 per cent. of the capital of the company and 93.07 per cent. of the dividend-paying stock.

Conclusion and Recommendations.

Owing to the irregularity of size and values of the veins in the Cobalt District and the great element of error in the sampling of very high grade ore, it is almost impossible to estimate absolutely ore blocked out, especially in the Crown Reserve, with the lake overlying the property; such an estimate would be little more than a guess. I might say this, however; the mine up to date produced roughly 5,800,000 ounces, of which the Carson vein has produced in development below the 100-foot level 800,000 ounces, and the other veins a total of 500,000 ounces, so that the stope above the 100-foot level on the Carson vein has produced about 4,500,000 ounces, or a little over $2,250,000.00. There is still as much ore left at this level on the Carson vein alone as has been extracted, and the whole stope between the 100 and 200 foot levels is practically intact. Besides this, veins Nos. 2, 14, 17 and 24 have rich ore shoots blocked out, and some of the other veins will be good producers.

For the coming year, I recommend that stoping be done on veins Nos. 2, 14, 17 and 24, so that they may produce a good percentage of the ore shipped, and that the other smaller veins be developed at the 100-foot level; that the Carson and No. 17 veins be exploited to the 300-foot level, and that at the 200-foot level the No. 2 cross-cut, with other cross-cuts running north from it at 500-foot intervals, be run for the entire length of the property. This, our diamond drilling and development work on the Kerr Lake, has shown the presence of veins on our property farther east, which these cross-cuts will undoubtedly cut.

Although the Crown Reserve mine produced practically one-sixth of the entire output of Cobalt during the past year, it is in much better physical condition, and has a great deal more ore blocked out than it had a year ago at this time, and I can see no reason, if the above recommendations be carried out, why the coming year should not be at least as successful as the past.

Very faithfully yours,

(Signed) S. W. COHEN,
General Manager.

LE ROI MINING COMPANY, LIMITED.

The tenth ordinary general meeting of shareholders of Le Roi Mining Company, Limited, was held on January 18th, at Salisbury House, London-wall, E.C., Mr. T. D. Grimke-Drayton, J.P., presiding.

The Secretary (Mr. Harold A. Wesson), having read the notice convening the meeting and the auditors' report,

The chairman spoke in part as follows: Gentlemen,—From the report and accounts you will see that, after deducting the sum of £34,026 8s 9d on account of exploration and development work, depreciation at mine and smelter, and other items, details of which are set out in the report and accounts in your possession, the operations for the year resulted in a net loss of £9,701 14s 1d. This is, of course, very disappointing, but I have no hesitation in saying that it is unavoidable. The absence of profits is to be attributed entirely to the lack of any considerable bodies of payable ore. At our meeting last year I told you we had discovered some rich ore in the 1,650 ft. level—the bottom level of the mine. For three or four months work done on this ore body indicated that it was likely to develop into a large and a very valuable asset. Unfortunately the rich ore found on this level, which was of considerable size, was not found on the winze level below, nor on the level above. In carrying on our work we came across large quantities of ore too low in value to handle.

Under the circumstances it soon became evident that a great deal more work must be done to ascertain if the extension of the

rich ore found on the 1,650 ft. level could be discovered on other levels; or if, by means of diamond drilling, payable ore could be found at greater depth in the mine. To carry out an exploration and development scheme of such magnitude necessarily involved very careful consideration. Mr. Carlyle, our consulting engineer went out to Rossland last winter and spent some weeks there looking thoroughly into everything on the spot, both above and below ground. Mr. Carlyle recommended that work should be suspended at the mine and smelter for a time until a large scheme of exploration work could be decided upon and the necessary arrangements made to carry out the same. Mr. McMillan was also at the mine, and after these gentlemen had thoroughly looked into the matter, along with the other officials at Rossland, they agreed in recommending the comprehensive scheme of exploration and development which is at the present moment being carried out. This work involves not only a large amount of diamond drilling on the lowest levels of the mine, but also arranges for thoroughly testing the property by means of the diamond drill for a depth of about 1,000 feet below the 1,650 foot level. In addition to this, a good deal of work has been and is being done by means of diamond drilling and by drifts and cross-cuts in other parts of the property. You will remember that a short time since you were notified that two finds of ore had been made by means of the diamond drill and that work was under way by means of cross-cuts to reach the places indicated. What the final outcome of this development work may be we cannot state, but you may depend upon it that, if any considerable bodies of payable ore exist in the mine, we are pretty sure to find them by means of the work we are now carrying out. The future depends upon the discovery and opening up of important bodies of pay ore. If we find these there will be no difficulty in making profits. No one has a greater interest than your directors in achieving satisfactory results, and you may depend upon it that everything that can be done is being done in your interest. I am pleased to say that the work we have been doing is approved by the shareholders at large, as shown by the fact that we are to-day supported by proxies representing nearly one-half of the capital of the company.

Mr. A. J. McMillan (managing director) said: There is but little to add to the speech made by the chairman, and to the reports already in your hands. You will notice that during the year we have spent liberally on exploration and development, and that the whole amount spent has been written off. Owing to the fact that so much of the exploration work done during the last year or two in the older parts of the mine failed to locate large bodies of ore of commercial value, and seeing that the high grade ore discovered on the 1,650 foot, or lowest, level of the mine last year, and to which reference was made at the last annual meeting, did not apparently continue any considerable distance below that level, it became necessary to deal with the question of exploratory work in a bold and comprehensive manner, and lay out our plans upon a large scale. After the most careful consideration, the work now under way was decided upon—work involving a great deal in the way of cross-cuts and drifts, and about 30,000 to 40,000 feet of diamond drilling in many different parts of the property, including portions hitherto unworked; and giving special attention to the lowest levels in the mine and the testing of the vein by means of boreholes for 1,000 feet below this. There is a large amount of low grade ore in the mine and on the dumps, amounting to some hundreds of thousands of tons—ore which, though too low to be of commercial value to-day, may some day be valuable owing to the progress in the direction of new and improved methods of treatment and reduction in treatment costs. As you have already been told, in carrying on our diamond drill work we ran into some ore of good value, but a considerable distance had to be driven and a good deal of work done to ascertain the value of these discoveries, the outcome of which is not yet determined. If the values are not in the ore we cannot, of course, put them there, but if large bodies of payable ore exist in the mine I have no doubt we shall discover them, and there will then be no difficulty in making money. Everything possible is being done in order to achieve results satisfactory to the directors and the shareholders alike.

Replying to questions, the Chairman stated that the superintendent of the mine had been looking round for some time for another property, but up to the present he had not found anything good enough to recommend. With regard to the development work now in progress, Mr. Carlyle, the consulting engineer, informed him that they ought to know definitely the result within the next few months.

Mr. McMillan proposed the re-election of Mr. Grimke-Drayton as a director, which was seconded by Mr. G. W. Wilson, and unanimously agreed to. The auditors were also re-elected.

STATISTICS AND RETURNS

The January output of the Nova Scotia Steel and Coal Co. is as follows:

Coal, 58,236 tons.
Ingots, 6,684 tons.
Pig iron, 5,740 tons.

GOWGANDA SHIPMENTS.

Jan. 1st, 1910.—Blackburn to Copper Cliff	30 tons
Jan. 14th, 1910.—Reeves-Dobie to Thorold	29 tons
Jan. 22nd., 1910.—Reeves-Dobie to Thorold	32 tons

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending Jan. 28, and those from Jan. 1, 1910, to date:

	Jan. 28 Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo		112,144
City of Cobalt		64,000
Cobalt Central	41,299	81,299
Cobalt Lake		132,000
Colonial	63,660	63,660
Coniagas		119,542
Crown Reserve	123,071	368,856
Drummond		664,200
Kerr Lake		302,605
King Edward		49,952
La Rose	123,500	700,531
McKinley-Dar	46,027	144,397
Nipissing	306,852	672,092
O'Brien		64,056
Right of Way		127,963
Temiskaming		60,000
Trethewey	65,000	65,000

Ore shipments for week ending Jan. 28 were 769,409 pounds, or 384 tons. Total shipments from Jan. 1 to Jan. 28 were 3,792,297 pounds, or 1,896 tons.

Following are the shipments from the Cobalt camp for the week ending Feb. 4, and those from Jan. 1, 1910, to date:

	Feb. 4, Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo	61,250	173,394
City of Cobalt	65,970	129,970
Cobalt Central		81,299
Cobalt Lake		132,000
Colonial		63,660

Coniagas	61,200	180,742

McKinley-Dar.	.....	144,397
Nipissing	300,300	972,392
O'Brien	69,050	133,106
Peterson Lake	49,600	49,600
Right of Way	.....	127,963
Temiskaming	60,000	120,000
Trethewey	.....	65,000

Ore shipments for week ending Feb. 4, were 924,062 pounds, or 462 tons. Total shipments from Jan. 1 to Feb. 4 were 4,716,359 pounds, or 2,358 tons.

B. C. ORE SHIPMENTS.

Nelson, B.C., January 29,—The feature of the ore shipments for the past week was the large number of shippers to the Consolidated Company's smelter at Trail, 33 properties sending in over 12,600 tons of ore. The first shipment to Trail has been made from the Sullivan in East Kootenay, and the Fern, close to Nelson, two properties long idle, but now being extensively developed. Appended are the details:

ANNOUNCEMENT

IN PRESS—WILL BE ON SALE EARLY IN FEBRUARY.

THE HANDBOOK OF THE COBALT DISTRICT

Including a Manual of Incorporated Companies.

By H. P. DAVIS.

¶ The first section of this volume is a treatise on the Geology, Mining Treatment and Marketing of the Ores of the Cobalt District, the object being to give all the data and general information necessary to guide investors, brokers and professional men generally.

¶ Included in this volume is a complete and accurate directory of all mining companies operating or organized to operate in the Cobalt Silver District of Ontario.

¶ Full information as to capitalization, directorates, locations and conditions of properties is given. Tabulated statements of production and dividends revised up to January, 1910, are included.

PRICE $1.50 paper Cover. - - $2.00 Stiff Cover.

BOOK DEPARTMENT

CANADIAN MINING JOURNAL

TORONTO

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Coal Mine for Sale

A coal mine in Alberta, city of 25,000, must be sold before the first of May.

This mine was opened last April and is thoroughly equipped.

Present capacity of over 200 tons daily and coal enough to last 20 years.

Good market for output and steady trade.

The present owner is obliged to sell and no reasonable cash offer will be refused.

For full particulars, write or wire

"Alberta" care Canadian Mining Journal

A CROWN MINERAL PROPERTY

Suppose the Government should say to you there is a property worth $10,000. We will sell it to you for $10,000, payable in 20 annual instalments and won't charge interest on deferred payments. In event of your death at any time during the 20 years, we guarantee to cancel the balance due and execute a warranty deed to your wife, or if she prefers, we will pay her $10,000 in cash. If you live to complete all payments, we will pay you $10,000 cash, plus interest earned on your annual deposits. Chances are you would jump at it. We are making just such an offer backed by assets of over $45,000,000. Better investigate it.

GEOLOGICAL SURVEY

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

MARITIME PROVINCES

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

QUEBEC

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

ONTARIO

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

THE NORTH WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.

THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

CANADA

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet.

1025. Waverley Sheet.

1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

ONTARIO

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.

1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

YUKON

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

REPORTS

1072. Summary Report of the operations of the Geological Survey for year 1908.

1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.

1075. Gowganda Mining Division, 1908. W. H. Collins.

1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.

1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10 00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

THE SIMPSON SHOE FOR MEN

MANY a man judges a pair of boots by the price he is obliged to pay for them. If they lose their shape or split at the toe in a short time he makes excuses for them. It was some fault of his feet that did it, or something wrong in his treatment. The boots were alright—they cost $6 a pair. They must be good.

But there's a better way of judging boots than by the price, to those who understand leather, to those who understand shoemaker's workmanship.

VICTOR SHOES

sell at $4.00, 4.50 and 5.00 per pair.

Try a pair. You'll find they give you the wear and the appearance you want despite their low price.

It's our own shoe, made expressly for us and there are consequently no middle profits or expenses.

INDUCTION MOTORS
IN
CRUSHING & CEMENT PLANTS

Polyphase Induction Motors have many advantages in the operation of rock crushers, ball mills, tube mills, rotary kilns, hoists, conveyors, pumps and other machinery. In addition to flexibility and economy, demonstrated in many other lines of service, electric drive eliminates long lines of counter-shafting, a specially desirable feature where gritty dust makes the maintenance of both belts and bearings very expensive.

In the dusty atmosphere of a cement mill the simple squirrel cage rotor of an induction motor is much less liable to give trouble than the wound armature of a direct current machine. The illustration shows one of our 100 H.P. type "AN" induction motors belted to a tube mill at the Belleville Plant of the Canada Cement Company Limited. The equipment of that plant includes over 1,000 H.P. of our motors.

Behrend Concentration System

Combination WET and DRY

A complete recovery from all slimes and minerals such as Graphite, Galena, Stibnite, Chalcopyrite, Tetrahedrite, Sylvanite, Molybdenite, Stephanite, Argentite, Ruby Silver and and Native Silver.

This system will make low grade deposits pay. Every mine having an eye to business should investigate this system which has the approval of leading mining authorities.

A completely equipped plant, including concentrators, crushers, rolls, etc., for testing purposes is located at address below. Forward a sample of your ore for preliminary test.

The Davis Handbook

OF THE

Cobalt Silver District

By H. P DAVIS.

ILLUSTRATED WITH PHOTOGRAPHS

¶ The first section of this volume is an outline on the Geology, Mining Treatment and Marketing of the Ores of the Cobalt District, the object being to give all the data and general information necessary to guide investors, brokers and professional men generally.

¶ Included in this volume is a complete and accurate directory of all mining companies operating or organized to operate in the Cobalt Silver District of Ontario.

¶ Full information as to capitalization, directorates, locations and conditions of properties is given. Tabulated statements of production and dividends revised up to January, 1910, are included.

THE CANADIAN MINING INSTITUTE'S TWELFTH ANNUAL MEETING.

The twelfth Annual Meeting of the Canadian Mining Institute will begin one day after this number of the Canadian Mining Journal appears. A large and representative attendance is assured. The number of visitors from the United States will be larger than usual. It is altogether probable that the sessions will be in all respects the most profitable on record.

In commenting upon last year's gathering in Montreal, we wrote thus: "In one respect the meeting that has just been concluded was an improvement on all preceding conventions. We refer to the fact that the proceedings were much facilitated by the presentation of papers in synoptical form. This saved time and made fuller discussion possible. Undoubtedly steps can still be taken in this direction. For instance, an inflexible time limit could be fixed for the presentation of any paper. Subjects foreign to the matter in hand should be rigidly excluded. . . . The custom of attaching consecutively numbered badges to all delegates has much to recommend it. An arrangement of this kind would obviate confusion and would provide an easy means of distinguishing members from non-members."

These remarks apply with equal force to-day. The discussions that follow the reading of papers are often of wider interest than the papers themselves. Not seldom, however, a speaker is permitted to ramble off into matters totally irrelevant to the subject in hand. It is hard for the chairman to correct this. The best preventive is the habit of putting one's remarks in writing first. Verbosity, unintentional or otherwise, is a cruel affliction. We hope, therefore, that no members will transgress in this respect.

Objectionable as long speeches are at any time, they are most intolerable at the Annual Dinner. On other occasions it is not impossible for the listeners to express their impatience. At the Dinner this, of course, is out of the question, and the offender gets off scot free except that he carries with him the undying aversion of those who have writhed under his eloquence. It is only fair to add that members of the Institute are not the worst sinners.

At the approaching meetings several questions of prime importance are to be settled. Among these are the formation of an independent professional society and the adoption of a new set of by-laws. Undoubtedly there will be much pother and some warm feeling. But it will be well to remember that diametrically opposite opinions can be held on nearly every question by equally competent and honest men. No harm can

result from open discussion, even if the atmosphere become tropic. Mischief comes in when a clique or faction is used to railroad a measure through, even though the measure be a good one.

One word more and we shall cease preaching. The success of all arrangements rests not alone in the Secretary's hands, nor is it in the power of special committees to make everything go smoothly. Every member must do his share. Prompt attendance at each session is most desirable. Equally desirable is prompt compliance witth the printed requirements issued by the Secretary. In short, the Secretary and the committees need all the assistance they can get.

. . . . .

The Canadian Mining Journal extends a warm welcome to all the visitors. Our sincere hope is that the coming Annual Meeting will be made exceedingly pleasant and profitable for one and all.

HAMPTON'S MAGAZINE AND MR. BANNELL SAWYER.

A magazine that appeals to the public for support must, tacitly or openly, accept responsibility for its advertisements. Hampton's Magazine stands sponsor for the exotic advertisements of Mr. Bannell Sawyer. That gentleman sells stock in the Cleopatra Mining Company, Ltd. "Messages" have been appearing from him in several numbers of Hampton's. This he declares to be his last—and for this mercy our gratitude is due.

Readers of Mr. Sawyer's effusions will be surprised to learn that there is no Cleopatra mine. There is a dubious prospect of that name. Moreover, Mr. Bannell Sawyer's advertisements are grossly misleading. Let us quote a gem from his latest announcement: "Foot by foot, yard by yard, our big compartment shafts are being driven down. . . . Very soon we shall tap at a depth of 100 to 150 feet the silver treasure that has been lying there for centuries waiting for the quick stroke of the drill to release it." This flower of imagination is surmounted by an ideal section in which the artist portrays two quaintly impossible shafts. These shafts penetrate successively "diabase formation," "Keewatin formation," and "silver level." Mr. Sawyer's diagrammatic geology is truly marvellous in its simplicity. Not less to be wondered at is the simplicity of those persons who purchase Cleopatra shares.

Incidentally, we do not admire the device to which Hampton's Magazine resorts. Instead of labelling such announcements as that of Mr. Bannell Sawyer plainly and simply, they are permitted to appear as a "supplement." This is manifestly cheap and nasty.

THE MINING SOCIETY OF NOVA SCOTIA.

Last year the annual meetings of the Mining Society of Nova Scotia and the Canadian Mining Institute were fixed for practically the same dates. Hence those who would otherwise have attended both were forced to make a choice. This year, we are glad to announce, the meeting of the Mining Society of Nova Scotia is set for March 15th and 16th. This will give ample opportunity for western members to attend without foregoing the Toronto meeting of the Canadian Mining Institute.

It is appropriate here to urge upon mining men generally the desirability of attending the Nova Scotia meeting. Much can be learned of undoubtedly good business and professional openings in the Maritime Provinces. The journey itself is decidedly attractive, and the meetings of the society are most creditably conducted.

Mr. A. A. Hayward, the Secretary of the Mining Society of Nova Scotia, will cheerfully furnish information. Further notice will be found in our "Personal and General" columns.

PETERSON LAKE.

One result of the litigation between the Peterson Lake Silver Cobalt Mining Company and the Nova Scotia Silver Cobalt Mining Company is that the treasury of the former has been enriched by 160,000 shares of stock and contains $58,000 in cash. Another result is that the Peterson Lake directorate is adopting a vigorous plan of development both on its own responsibility and, as has been done in the past, by means of leasing parcels of its territory.

A circular issued by the company will be found on another page.

EDITORIAL NOTES.

The freight rate on copper ore from Skagway to the Tyee smelter, Ladysmith, is $1.46 per ton. The distance is about 1,000 miles.

One item that lends colour to the rumoured purchase of the Dunsmuir collieries by the C. P. R. is the fact that the latter corporation some time ago filed at Ottawa plans for the erection of large coal bunkers on the Indian reserve. However, the newspaper reports concerning the McKenzie-Mann activities have not been contradicted.

The terms of the new agreement under discussion between the employers and the colliery workmen of South Wales include some interesting new provisions. Among these is one requiring all men applying for work to be subjected to medical examination. This is thought by the employers to be a necessary safeguard against complications arising under the Compensation Act.

It is much to be regretted that the American Institute of Mining Engineers has seen fit to hit upon the first week in March for its annual meeting. That meeting is to be held in Pittsburg. Many of the members of the Canadian Institute are also members of the

merican body. These members would have been glad f the chance of seeing Pittsburg under the auspices f the A. M. I. E. Unfortunately they can do nothing ow beyond projecting their astral bodies into the ircle illuminated by Dr. Raymond and his fellow-conspirator, Dr. Struthers. The incident is the more regrettable since the practice of the American Institute heretofore has been to hold its meeting during February. We hope that somebody's wrist will be well slapped.

FORESTRY AND THE COAL AREAS OF THE YUKON TERRITORY.

By D. D. Cairnes.

(By permission of the Director of the Geological Survey Branch of the Department of Mines of Canada.)

So much has, of late, been said and written concerning the preservation of our forests, and the rapidly-approaching time when all the known deposits of coal will have become exhausted, that in treating of the forestry and coal areas of the Yukon, it will not be necessary to emphasize the vital importance of these natural resources for the welfare of the district; as they are quite as essential factors in the industrial advance of these northern and somewhat sparsely-settled districts, as they are of the more populous portions of the continent.

As extensive portions of the Yukon Territory, which embraces 207,076 square miles, are as yet but slightly or altogether unexplored, our knowledge concerning its timber is very imperfect, but as far as is known the district is generally wooded and the forest consists chiefly of 12 species, 8 of which attain the dimensions of trees, the others being possibly better considered as shrubs. These are white spruce (Picea alba), a black spruce (Picea nigra), balsam fir (Abies subalpina), black pine (Pinus Murrayana), balsam poplar (Populus balsamifera), W. balsam poplar, (Populus trichocarpa), aspen poplar, (Populus tremuloides), three species of birch and two of willows (Salix).

The white spruce is the most widely distributed and most useful tree in the Yukon, and is found of fine, to good, quality in all the valleys and lowlands. It makes a fair grade of lumber and is well suited for purposes of construction generally. It is seen at its best on the islands and alluvial flats of the main rivers, where it forms fine groves of merchantable timber, easy of access. The groves are small, as a rule, but the aggregate amount of good spruce timber which they contain is considerable. Here trees, measuring one to two feet in diameter, occur in most places and, in a few localities, individuals have been noted which measured three feet, and logs 60 feet long, with a diameter of one foot at the smaller end, can be obtained. Up the slopes of the valleys, the white spruce, under favourable conditions, continues to be a fine forest tree, but decreases in size near the heads of the rivers, where it generally does not exceed eight inches in diameter. In the Klondike district, timber only extends to 3500 feet above sea-level, but in some other portions of the Yukon it reaches as high as 4700 feet.

Balsam fir, which is, in places, as large as 18 inches in diameter, is next in importance to the white spruce, and occurs only in high valley bottoms and on mountain slopes, and appears to thrive best at about 1200 feet above the main valleys, decreasing in size above and below this elevation.

Black pine is fairly abundant in certain localities in the southern Yukon, and occurs chiefly in swampy portions of the valleys on moss-covered slopes facing the north, and, in thin groves, upon dry benches bordering the rivers at 40 to 300 feet above the water. However, it is not an important forest tree, being generally only 4 to 6 inches and seldom over 9 inches in diameter.

The poplar grows on islands and alluvial flats of the main rivers, and is seen in all stages of growth, from a small shrub to a considerable forest tree. The aspen are found over a large portion of the Yukon territory and are especially characteristic of the dry, open grassy hillsides. Three varieties of birch have also been noted, two of which are in most places only poles, but the third (Betula resinifera) is sometimes 8 inches in diameter and has supplied a considerable portion of the fuel consumed in the Dawson mines. It is never tall, however, seldom giving a trunk that will produce two 16-feet lengths for fire-wood.

The most widely distributed shrub is the dwarf birch, (Betula glandulosa), which occurs chiefly on the higher hills and ridges above the timber line. Along the river banks, alder, willows, and brier-rose are abundant.

It will thus be seen that the timber of the Yukon is limited, but that there is, however, considerable, practically everywhere, except in a few localities where there has been a heavy drain upon it, such as in the vicinity of Dawson and along the river banks from Whitehorse to Dawson. But nowhere are the forests of the dense nature encountered to the south, as in British Columbia and in Eastern Canada. The thin growth is probably due to the permanently frozen ground just below the forest floor in most parts of the territory.

Concerning the mineral resources of this immense territory, our information is of a very fragmentary nature, and this is particularly true regarding coal, which naturally has received much less attention at the hands of prospectors than the precious metals. However, anthracite and bituminous coals and lignites have been found in the Jura-Cretaceous and Tertiary rocks of the Yukon Territory at numerous points along the Lewes and Yukon Rivers and their tributaries, particularly the Nordenskiold, Klondike and Indian Rivers and Coal Creek; and three mines have been opened up and a certain amount of work has been performed in other places. However, the known occurrences of each are nearly all along the waterways, where the more detailed investigations have been made. In fact, very little prospecting has been conducted away from the main lakes and rivers, so that, in all probability, further exploration will show a considerable extension of the coal-bearing horizons.

The Sour Dough Mine is situated 12 miles up Coal

Creek from where it joins the Yukon river, 50 miles below Dawson. Here are a number of good workable seams of lignite, up to 12 feet thick, which have been worked to some extent, during the past few years, and from which a few thousand tons have been shipped to Dawson. There is also a 6-foot seam of good lignite about 20 miles from Dawson on a branch of Rock Creek, a tributary of the Klondike. Also some seams of coal have recently been reported to have been discovered on Indian River. These are all believed to occur in rocks of Tertiary Age which have an extensive development to the west and south-west of the above-mentioned localities.

The Tantalus mine is situated on the left of the Lewes River, 190 miles downstream from Whitehorse, and about midway between the latter and Dawson. At this mine three seams of bituminous coking coal have been developed, averaging perhaps, 7 feet, 6 inches, 6 feet, 6 inches; and 3 feet in thickness, which have been mined for several years and from which in 1907 nearly 10,000 tons of coal was shipped. Across the river from where the same measures outcrop on Tantalus Butte where seams of good, clean, coal, 8 feet 10 inches, 9 feet 10 inches; and 7 feet, have been prospected to some extent. These same measures, which are of Jura-Cretaceous age, were found outcropping for several miles to the north and south of Tantalus Butte and Tantalus, respectively, and are believed to be extensively developed to the south and southwest of the latter. From the Five Fingers mine on the right limit of the Lewes River, 16 miles below Tantalus,, considerable coal was shipped some years ago, but since then the company has been chiefly engaged in prospecting and developing the property. The widest seam here is about 4 feet thick, and is a good bituminous coking coal.

A few miles southwest of Whitehorse several seams of anthracite coal have been discovered, two of which are 9 feet 8 inches and 10 feet 4 inches thick respectively, and which belong to the same geological horizon as the coals at Tantalus. Only a small amount of prospect work has been done here, but the measures have been traced several miles to the west.

Seams of lignite are also known to exist in the Kluane district to the west of Whitehorse, and prospectors report having found numerous valuable coal seams in this district. So, judging from the wide distribution of the coal-bearing formations, it is believed that extensive portions of this territory are underlain by valuable coal deposits, thus to some extent counterbalancing the lack of the forests with which nature has endowed other parts of Canada.

For more detailed information concerning the coals of the Yukon the reader is referred to the writer's reports on the Yukon Territory for the past four years, published by the Geological Survey Branch of the Department of Mines of Canada.

The following are a few analyses of Yukon coals:—

Locality.	Water.	Volatile Combustible Matter.	Fixed Carbon.	Ash.
Sour Dough Mine, average of scowload	14.46	33.94	40.52	11.08
Tantalus Mine, from adit where seam was 6 ft. 6 in. thick	0.76	24.74	58.60	15.90
Tantalus Butte, surface average of 8 ft. seam	13.64	31.83	51.84	2.69
Five Fingers Mine, 2 ft. seam	5.95	40.46	45.16	8.4
Whitehorse anthracite average 9 ft. 8 in. seam	2.15	6.01	69.86	21.9

STATE AID TO MINING.

The government of Australia pursues a most en lightened policy in regard to the management of min ing. During 1908 the following specific appropriation were made:—

Advances in aid of mining work and equipment o mines with machinery, £8445 16s. 5d.

Advances in aid of boring, £1038 3s. 7d.

Subsidies to provide crushing plants, £2076 5s.

Purchase of boring plants, £1596 9s.

Providing means of transport, £2001 17s. 2d.

Mining water supply, roads, cartage of ore, drainag timber tramways, developmental work below 100f level, £1338 6s. 11d.

Private crushing plants subsidies, £2075 5s.

The total is £18,573 3s 1d.

The subsidies given to private crushing plant own ers are on condition that they crush for the public a fixed rates. Mr. A. Montgomery, the State Minin Engineer, has recommended for the last two years, tha the Mining Development Act should be recognized an amended, so that guiding principles may be clearly lai down as to the sort of applications for assistance tha should receive consideration and the terms on whic State aid can be made available. The revenue receive by the Government in 1908 in return for its expenditur on mining was:—By refunds on loans, £539 1s. 11d. from sales of securities realized upon, £1559 14s.; mis cellaneous sources, £1043 14s. 10d.; total, £3142 10s. 9d During the same year £3836 14s. 3d. was written off o account of advances deemed to be irrevocable.

Advances under the head of "Pioneer mining" cover all mining work, including the purchase of ma chinery. It is stipulated, however, that the propose operations must be approved by a professional officer o the department. The limit of any individual advanc under this head is £1000 and the borrower must spen a like sum. Individual advances under "prospecting" are limited to sums of £300. In this case the borrowe has to put up an equivalent of pound for pound in la bour or material. On the erection of State batteries the capital outlay to the end of 1907 was £237,029. The profit and loss account for 1907 shows an expenditure of £92,973 and an income of £91.274, leaving a debit balance of roughly £1698 on the year's working. This includes the accounts of cyaniding slimes and tin plants all of which operated at a profit, but such profit was absorbed in the deficiency of revenue from the batteries which in that year, totalled £8725. Altogether, the State spent £95,624 in the smelter business. The receipts, including the money for the sale of the plant amounted to £81,690. So the business resulted in a direct monetary loss, but the Government consider that this is more than offset by the benefits accruing from their having opened up the Phillips River field and the consequent introduction of foreign capital.

The lowest price on record for copper during the past thirty years was reached in 1894, when the metal fell to 9 cents per lb. During that year also, the average price was lower than recorded during thirty years, namely, 9.43 cents per lb. The highest recorded price during the same period was 26.25 cents in 1907.

THE PROTECTION OF MINE TIMBERS FROM FUNGUS.

From the Journal of the Canadian Mining Institute, by John Macoun, Dominion Naturalist, Ottawa, Ont. (Paper to be read at Annual Meeting, Toronto, 1910.)

There is nothing connected with the working of mines of greater importance than the protection of mine timber from rot. It is a matter concerning which little is commonly known. When so much depends upon the strength and stability of mine props, it is remarkable that at the present time practically no efforts have been made to lengthen the life of mine timber. Of the most destructive fungi, even science has not much knowledge. Many of them belong to the genera Merulius and Polyporus. Merulius is the commonest form of dry-rot, and attacks chiefly pine and fir. The name dry-rot carries with it a wrong impression, as dry wood is never attacked; damp, unventilated situations being most favourable to the growth of dry-rots. Well ventilated mines are to a very considerable degree free from fungus growths. In both the genera referred to—Merulius and Polyporus—the rot is caused by the mycelium which penetrate the wood, thus destroying it. The fungi themselves are often of large size, but the actual damage is done by the thread-like mycelium. The molds which are so frequently seen on mine timbers, most of which are of the family Hyphomycete, are not really injurious to the timbers; their natural habitat is on the surface of wet wood, and when the conditions are suitable they grow in mines, just as they do in our cellars, without any direct injury to more than the surface of the wood. It has been generally assumed that the treatment that has proved so efficacious in preserving railway ties, telegraph poles and fence posts might be used in mines; but this is not the case, and saturating the wood with creosote is not only expensive, but is not a sure preventive. Apart entirely from the great expense these methods entail, the conditions are so vastly different that it is more than doubtful whether the results of open air experiments are of much value when applied to deep mines.

Acting under instructions from the Director of the Geological Survey, I visited several mines in the Rossland district in September, 1908, and was astonished to find that nothing whatever was being done there to protect mine timber from rot; and from what I have been able to learn from men familiar with Canadian coal mines, the conditions in these mines are even worse than they are in any other kind of mine, because—as I shall explain later—the timbers now in place in these mines may be preserved at a very small cost.

During the last thirty years I have spent many seasons on both the Atlantic and Pacific coasts, and the difference between the condition of the driftwood on these coasts and that found along our interior lakes attracted my attention many years ago. Members of the Geological Survey staff inform me, moreover, that the wood found along the shores of Hudson Bay, the Mackenzie Delta and Behring Sea is of the same character as that which has come under my own observation. Speaking generally, all wood found on the seashore is free from fungus rot, while that found along fresh water streams or lakes begins to rot within a year or two after it is left on the shore. The inference is plain. Some constituent in the salt water protects the wood, and when we remember that all fungi are produced from spores—microscopic in size—it is evident that if these spores can be prevented from developing, fungus rot is impossible. Since my return from the field last autumn the Director of the Geological Survey has shown me a description of what is known as the Henry Aiken method of treating timber for use in mines. A full account of Mr. Aiken's treatment may be found in the Summary Report of the Geological Survey for 1908, and only the briefest summary need be given here.

In this process the timber is soaked in water, raised to a temperature of from 190 to 200 degrees Fahr., and contains enough common salt to form a thoroughly saturated solution. The timber should be free from bark, fairly well seasoned and thoroughly dry. Tests made in many British collieries have proved conclusively that this treatment is in every way a satisfactory one. In one mine the timbers, after being in place five years, were perfectly sound, and in another they had shown no sign of rot at the end of six years. What is even more noteworthy is an experiment made in Fifeshire. Two pieces of ordinary fir, 3½ inches in diameter and 3 feet long, both weighing 10 pounds, before being treated, were selected. One of the pieces was treated by the salt process and the other not. After being treated, it weighed 12 pounds. Both were taken underground and placed in a return air-course and after eleven months were examined and re-weighed. The untreated timber then weighed only 5 pounds whereas the treated wood weighed 12 pounds, or exactly the same weight as when it was put in. They were replaced in the mine and allowed to remain eleven months longer, with the result that the untreated timber weighed 6 pounds and the treated timber weighed 11¾ pounds. They were again replaced in the mine, and after an exposure of three years they were examined, and while the treated piece was sound, the untreated one was decayed. Such evidence as this must be considered as conclusive, and as the salt water treatment is inexpensive, there seems to be no good reason why all mine timbers should not in future be treated in this way. Timbers already in place might from time to time be sprayed with salt water for, while such treatment could not be expected to prove as efficacious as if the wood were soaked in brine, still it is reasonably certain that few fungus spores could develop on wood that was so treated. In coal mines where spraying is systematically done for the purpose of preventing coal dust explosions the addition of salt to the water used would entail very little extra expense. What is certain is, that when the greatly enhanced price of timber in recent years is taken into consideration, the cost of treating mine timbers with salt is insignificant as compared with the money that would be saved.

PROSPECTS OF THE TYEE COPPER COMPANY.

During a visit to London, at the close of the past year, Mr. W. H. Trewartha-James, general manager of the Tyee Copper Co., Ltd., delivered an address at an informal meeting of the shareholders. Extracts are reproduced herewith:—

"With regard to your smelting industry, let me recapitulate the great advantages which give you such a commanding position in the smelting industry on the Pacific coast. You have, in the first place, a beautiful land-locked bay, which is also an important coaling station for the steamers of the Canadian Pacific coastal

trade and for the shipping generally, which plies along the Pacific coast. You have a valuable smelter site, consisting of some forty-four acres of land abutting on the sea, which I estimate is worth to-day, as an industrial site for a lumber mill, or any other industrial purpose, not less than £9,000. That asset is therefore one of considerable value, though it does not as yet appear in your balance sheet. You have a valuable contract, ensuring you a continual supply of coke and water—coke at a lower price than it can be obtained anywhere else on the Pacific coast—water to the extent of 1,000,000 gallons daily practically free. You have your own wharf, at which the largest vessels plying the coastal service can lie securely and discharge cargoes in bulk at the rate of from 80 to 100 tons per hour at all stages of the tide. The new furnace, now in operation, contains practically all the most up-to-date improvements in furnace work and you have the great advantage of being able to draw from the prosperous and rapidly-growing town of Ladysmith ,in which your smelter is situated a competent band of workmen, both skilled and unskilled, at fair wages, with every facility and convenience for themselves and their families. We are not hampered by any restrictions or unduly severe regulations as to noxious fumes and furnace smoke. The municipality of Ladysmith, and the government of British Columbia recognize that industrial expansion is necessary, and they seek to assist rather than to hinder progress. As you know, the rapid growth of towns and populations tends to restrict in a remarkable way the available smelting sites on the American seaboard south of Canada. You have a geographical position which assures cheap freight rates on ore in both directions. The main traffic going north consists of goods, provisions and machinery, and the vessels are short of return freights, so that special rates are obtainable for ore cargoes southward bound to your smelter. We can carry ore from Skagway to Ladysmith, some 1,000 miles, in bulk for 6s per ton. Then again, going south, we have vessels laden with lumber and coal, which have to come back in water ballast unless they can bring ore. Thus we have a back cargo rate as far south as South America of 14s. per ton, and we are now in a position to compete for our share of that valuable and growing business. . . . . So far, I have, in dealing with the past and in bringing your knowledge down to date, confined my remarks solely to the facts as facts. The conditions upon which our future prospects depend are so complex, so liable to variation from causes entirely beyond our control, that you will fully appreciate the necessity for my restricting any natural enthusiasm I possess, and of giving my reasons for dealing with our prospects from a most careful and conservative standpoint. Mr. Daniel Guggenheim was recently quoted in New York as saying that the copper ore customs smelting business is the most worrying and ungrateful business he has ever been connected with, and I think my own experience makes me most frankly echo these same sentiments. Who could have imagined that your customs ore supply of 4,800 tons per month in 1907 would have fallen to 800 tons per month in 1908? And only by dint of the most strenuous exertions, and, I admit, with a full measure of good luck, has it been possible to get back to a normal basis of 50,000 tons per annum. I have already explained that I attribute this partly, not wholly, to the slump in the price of copper, and to the New York panic of 1907, which forced producing mine owners to close down, as the owners had no margin on which to continue operations. This will show you, gentlemen, that our prospects are to some extent, dependent on the price of copper, and I do not believe there is any man in the world, be he never so wise, who can possibly give us any certain prognostications hereabout on which we can absolutely rely. My own opinion is necessarily largely formed by association with prominent Americans, who may, I believe, in the course of a few years, almost completely control the production of this important metal. In my opinion—I am referring now to what you have read about the great American copper combine in New York—we have to-day associated the best, the most powerful and the wisest men in the Western land in an effort to standardize and regularize the price of this product. I do not believe they intend immediately to put up the price of copper unless the relative proportions of consumption and production justify that course. I believe their object is to maintain a fair and regular price for copper, so that trade conditions shall not again be subjected to the extraordinary variations caused by the great fluctuations in the price, such as those which occurred in1907, when copper fell from £115 to £55 per ton within a few months. I believe too, that this powerful American copper combination will ultimately attain its object. Now in London most of the best informed people I have met (there are a few notable exceptions) believe that the production of copper is, and will be for the next two or three years, largely in excess of demands. As I understand it, the Americans connected with what has been called "The Great Copper Combine" see their way clear to place in industrial circulation every pound of the heavy excess stock of copper, the existence of which we must freely admit. Trade conditions tend to become more normal, and money for investment appears to be freer out West than it is here, and so far as I am justified in expressing any personal opinion, I say unhesitatingly I expect a steady upward movement in the price of copper until a maximum of £70 per ton has been reached. The industrial developments on the Pacific Coast are progressing now so rapidly and by such leaps and bounds that when last year President Taft came to visit the Seattle Exposition, notwithstanding his close touch (through his statisticians and principal advisers) with all the facts and figures of that development, it was not until he had made his personal inspection that he realized what progress was being made, and this is what he is reported to have said: 'I see spring up on the Pacific coast a new empire, which will in the course of a few years dominate the commerce of the world.' This is a great thing to say, but that is President Taft's view and was expressed in public. Certainly in Canada and in America the trend of capital investment is most decidedly westward, and your industrial enterprize lies right in the path of that movement. It can hardly fail to benefit you. Our prospects, of course, also depend on your getting more ore contracts. During the past eighteen months, we have done well—indeed we have so far got more than our share of the business going on the coast, so that all I need say in this respect is that I see no reason why we should not continue to hold our own."

In the fifteenth century the world's annual production of gold did not exceed $4,000,000. Since then it has increased one hundredfold.

ELECTRIC STORAGE BATTERY LOCOMOTIVES IN HUNGARIAN MINES.

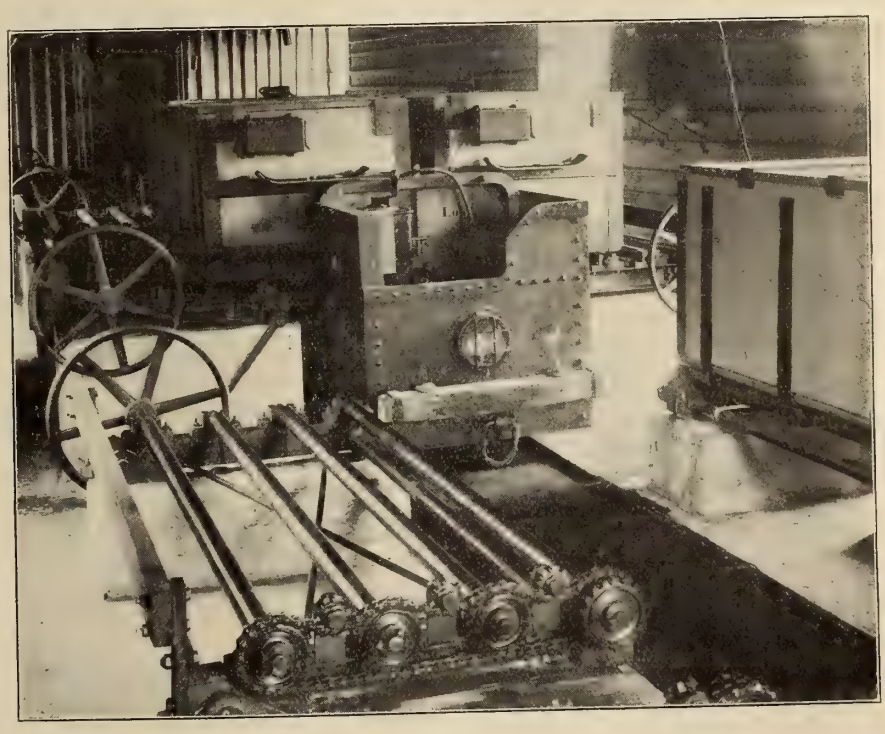
By Frank C. Perkins.

There are a number of mines in Austria-Hungary which have been equipped with electric storage battery locomotives of the unique construction noted in Fig. 1 and 2 and drawing Fig. 3, the batteries being mounted on the top and being removable for charging. There is a special gearing provided with permanent rolls fixed in the top of the locomotive, which makes it possible to shift the discharge batteries and replace them with fully charged sets for the locomotive, with a minimum expenditure of labor and time.

Fig. 1.

There is no doubt that the storage battery locomotives have some advantage over those operated by overhead trolleys or third-rail conductors. They are thoroughly reliable and are of no danger to the miners. They also have a radius of action without extensive overhead construction.

In the Hungarian Petrozseny mine there are 8 storage battery locomotives in operation, of the type shown in illustration Fig 4, each having a capacity of 12 horse power. These locomotives of the Zalgo-Tarjaner-Kohlen—Bergbau Aktiengesellschaft are operated in pairs. These double accumulator mining locomotives thus formed, have a total capacity of 24 horsepower and



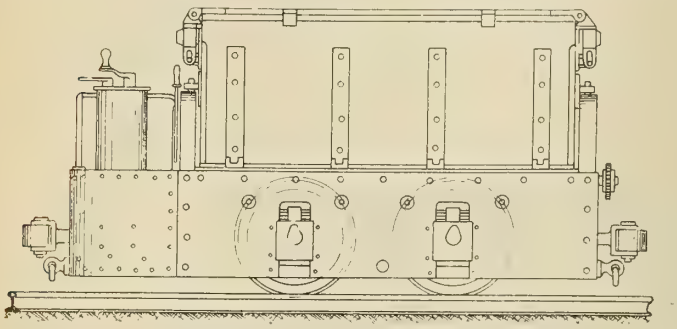


Fig. 2.

are capable of hauling 40 cars without difficulty. At this mine there are 16 sets of batteries used. The Tudor type of cells are employed as built at Budapest by the

Tudor accumulatoren Fabrik Akiengesellschaft. Each locomotive has 51 cells, with a capacity of 74 ampere hours each.

The largest Elektromontana storage battery mining locomotives usually installed in German mines are of 24 horse power and 32 horse power capacity and each locomotive is provided with two sets of batteries when un-

Fig, 3.

interrupted service is required, one of which is being charged, while the other is operating the locomotives.

The unique roller and chain arrangement on the locomotive frame and charging table, makes it possible to shift the batteries with very little difficulty. The batteries are seldom discharged more than 60 or 70 per cent of their capacity, and it requires for charging only about one-third of the time usually taken for discharge in operating the mining locomotives.

When partially discharged, the storage batteries may be fully charged in about one and a half hours. The 20 horsepower mining locomotive is equipped with two independent sets of batteries of 90 cells each, having a capacity of 74 ampere hours, which are capable of giving 400 effective ton kilometers in normal service.

When two storage batteries are employed with the small locomotive, the cost is about 1200 marks, or $300.00 per horse power while for the larger locomotives the cost is considerably less, or about 800 marks, equivalent to about $2,00 per horse power.

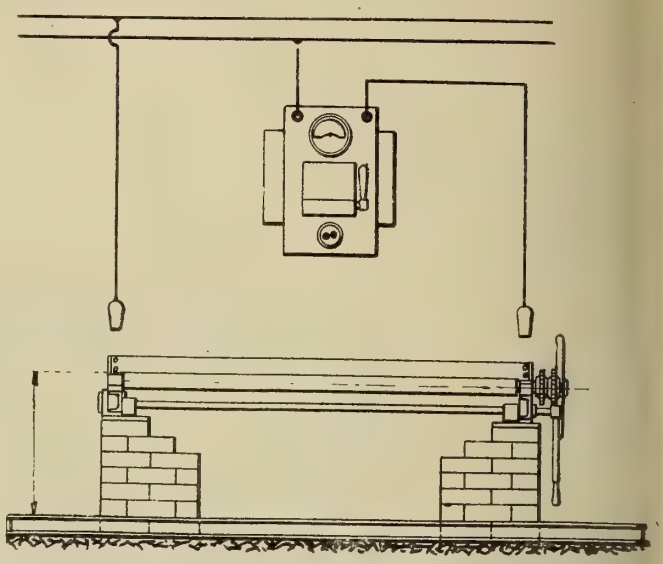

Fig. 4.

It is maintained that the cost of operation for these storage battery mining engines is from one-third to one-half the cost of animal power for similar service, and the current required is from one-quarter to one-third kilowatt hour per ton kilometer capacity. An advantage of these storage battery mine haulage equipments worthy of consideration is that no added weight is required for adhesion and the storage batteries supply all the necessary weight needed.

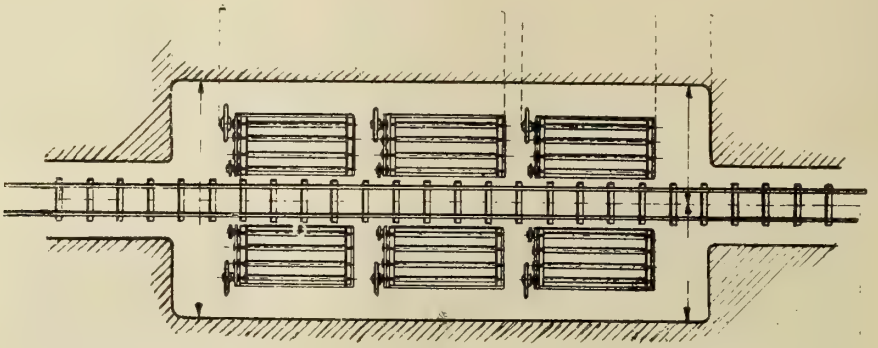

Fig. 5.

ADVANCE CHAPTER FROM H. P. DAVIS' HANDBOOK OF THE COBALT DISTRICT.

Production and Dividends.

The tables included in this volume give the production of the Cobalt mines to December 31st, the authorized and issued capital and the dividends paid by each company.

An analysis of these tables shows that forty-four mines have shipped in six years *78,589.94 tons of ore, which yielded **62,500,000 ounces of silver of a gross value of **$33,304.260.00. The recorded sales of cobalt, nickel, and arsenic, bring the total up to not less than than $34,000,000.00. Of the forty-four mines which have shipped ore, ten contributed a total of less than 200 tons, and can hardly be counted on for further shipments. Seventeen of the thirty-four shipping mines have paid in dividends and in profits to private owners

a recorded total of $17,101,504.82; adding to this the proceeds from ore sales by private owners before incorporation brings the total to not less than $17,860,000.00

During 1909 twenty-eight mines shipped *29,996.51 tons of ore, which yielded 25,000,000 (estimated) ounces of silver, of an estimated value of $12,875,000.00. Of these twenty-eight shippers, twenty-six were public companies. Thirteen of these twenty-six companies, with a total issued capitalization of $35,000,000.00, shipped 25,414 tons, or 85 per cent. of the total, and paid in dividends $6,468,853.42, or 18½ per cent. on their issued capital at par.

To this must be added profits divided by two privately-owned properties estimated at $600,000.00, making a total of $7,068,853.42 paid in dividends and profits in the twelve months.

Value of Ore Per Ton.

	Average Value per Ton.	Average Price Silver per Ounce.
1904	$862.00	$0.572
1905	687.00	0.604
1906	705.00	0.665
1907	426.00	0.653
1908	362.00	0.528
1909	429.00	0.515
Average for 6 years	442.00	0 5895

The increase in value per ton for 1909 over 1908, in spite of the decrease in the price of silver was the result of the shipment of concentrates.

The average value per ton for the six years was $442. Including all dividends and profits distributed, $215 has been paid for each ton of ore shipped, or about 50 per cent. of the gross value of the production. The record for 1909 is even more remarkable. The average value per ton was $429, while $236 was paid in dividends for each ton of ore shipped.

The following table illustrates the rapid advance and increasing importance of Cobalt as a factor in the world's production of silver:—

Silver Production (Fine Ounces).

Year.	World's Production.	United States.	Per ct.	Montana.	Per ct.	Cobalt.	Per ct.
1904	168,390,238	55,999,840	33.25	12,817,285	7.61	206,875	.12
1905	157,339,962	56,101,600	35.66	13,454,700	8.55	2,451,356	1.56
1906	158,313,445	56,517,900	35.70	12,540,400	7.92	5,401,766	3.41
1907	159,456,333	56,514,700	35.44	11,129,600	6.98	10,023,311	6.29
1908	203,186,370	52,440,800	25.80	10,,356,200	5.09	19,437,875	9.51
1909	*205,819,977	53,849,000	26.16	12,000,000	5.83	25,000,000	12.14

*1909, estimated.

In 1904 Cobalt produced twelve one-hundredths of one per cent. of the world's silver. In 1909, five years later, Cobalt produced over 12 per cent. of the total world's production, placing Canada third in the list of silver-producing nations.

Last year Cobalt shipped almost one-half as many ounces of silver as the United States, and more ounces than the combined output of Colorado and Montana.

* Net tons as shown by T. & N. O. R. R. freight statements.
** Estimated for 1909.

THE PORCUPINE GOLD FIELDS.

By W. H. Spencer.*

The Porcupine gold district is situated about 30 miles west from the 222 mile post on the Temiskaming & Northern Ontario Railway. This means 222 miles north from North Bay on the Canadian Pacific Railway. Porcupine Lake, in Whitney Township, so far appears to be the centre of activity, and from the showings on the surface this district promises to be one of the great gold producing camps of the continent. Claims are being staked by the thousand and as the assessment work is being done the gold discoveries are very numerous. The best showings to date are in Whitney and Tisdale Townships. This is altogether on account of these being the first discoveries, and having so far most work done on them; but good discoveries are being made in Shaw, Mountjoy, Godfrey and Carman Townships, and in the Temagami Reserve.

There is said to be about 50 miles square of this gold-bearing country. The properties so far being operated are the Bannerman, Way, Griffin, and Foster claims in Whitney, the Davidson-Dobie and the Hollinger and Wilson in Tisdale. There are also some good showings in the Temagami Reserve immediately south of the Wilson and Hollinger groups. The McMahon group lying south of Lots 8, 9 and 10 in Tisdale consists of six claims, and has veins from 2 to 10 feet wide showing free gold. The assessment work is now being done on this group, and on the completion of the work there is no doubt but this group will give a good account of itself. These claims are directly in the trend of the best showings in Tisdale.

The Hollinger has most work done of any in the southern part of Tisdale, and from the indications on this property there is no doubt that the ore will change into a sulphide with depth.

They have a shaft down about thirty feet, and are in a milky white quartz showing galena and free gold. This ore is very soft, and I presume an ordinary thousand-pound stamp would crush three tons per twenty-four hours without any trouble. The surface showings on the Hollinger and Wilson are quite spectacular, and will without doubt resolve themselves into large low-grade propositions. The Hollinger vein at the present showing is 125 feet wide and only one wall in sight. I presume the greater part of this ore will run below $10, but with the rich ore used to bring the average up, it will probably make a milling proposition of $12 to $20 per ton. This will require large concentrating and cyanide plants. The present year will be required to

get in sinking and prospecting plants, and it will take another year before the permanent plants and machinery can be erected. This means that it will take two years from date before any returns can be depended upon.

There are large tracts of this country that are considered to be swamp, when in reality they are not. The country generally is low and rolling, with elevations perhaps 30 or 40 feet above the level of the water, but the timber grows so thick that the sun never gets to the ground, and the consequence is that the moss becomes thick and holds the moisture, giving it the appearance of swampy ground, but by raking the moss away with a pick, rock is laid bare.

Again, the lowering of the Frederickhouse River by cutting away the falls, which has now been done, will drain thousands of acres that would otherwise be swamp.

THE GEOLOGY, MINING, AND PREPARATION OF BARITE IN WASHINGTON COUNTY, MISSOURI.*

Extracts from Paper Read Before the American Institute of Mining Engineers, Spokane Meeting, September, 1909.

By A. A. Steel, † Fayetteville, Ark.

Barite deposits are scattered over nearly the whole of Washington and adjoining counties, but the product is all mined from the areas indicated upon the sketch-map, Fig. 1, and is shipped from the stations of St. Louis, Iron Mountain & Southern Railway, between Blackwell and Potosi, from 45 to 60 miles S.W. of St. Louis.

The topography is for the most part gently rolling, with slightly graded streams, usually less than 200 ft. below the higher hill-tops. Along Mineral Fork and Indian Creek are some steep bluffs and cliffs, affording good exposures of the formation. Nearly all the rest of the area is covered to a depth of from 5 to 40 ft. with residual clay containing chert, barite, etc. This overburden greatly interferes with the study of the bed-rock which is exposed only at intervals in stream-beds, in a few barite pits and in those lead mines which have not been abandoned.

Present Condition of the Barite.—As the dolomite became dissolved the barite accumulated with the clay, flint, and other residual material. Commonly the barite is somewhat concentrated at a depth of from 2 to 6 ft., probably the lower limit of the disturbance of the soil by frost and other agencies. Above this, the clay contains an unusual amount of flint or chert uniformly scattered through it.

Beneath the first bed of barite the clay seems more undisturbed and the barite is scattered irregularly through it. Most of the slabs of barite have fallen over and are now horizontal, and there is likely to be a little more barite immediately above the bed-rock. The upper part of the weathered dolomite is soft and crumply and is often called sandstone. Some of the larger slabs of barite are dug from this until it becomes too hard. Near the bed-rock the barite is quite hard, more nearly translucent, and contains iron-stains only upon the surface.

Near the surface the barite is commonly not much softened, but thin layers of limonite are deposited in the cleavage-planes, along which the barite breaks up. When very dark and purplish this barite is sold at half price as No. 2, or "battle axe," on account of the difficulty of bleaching it. There is a little which is deep yellow all through. It was said that this stain was not due to iron and could not be removed by sulphuric acid in the bleaching process, even by those mills which grind before they bleach. It cannot therefore be sold. Laboratory tests show that the stain is only iron and clay, and perfectly soluble in rather strong sulphuric acid. Frequently, quite a lot of barite of walnut-size is found near the bottom of the flint-zone.

In places, the lumps of barite adhere to a good deal of chert which probably once projected from the walls of the caves. Upon other specimens are shells of hard, dark limonite, called "metallic iron," and representing weathered marcasite. Both the flint and iron can be chopped off with a hatchet. The quartz crusts, called "mineral blossom," are so irregular and so frequently included in the barite that they cannot be chopped off, and reduce the grade to No. 2, because the resulting grit is especially objectionable in the barite floated for pigment. Where there is much mineral blossom, the barite is therefore not mined. A little barite which probably once contained strontium sulphate, is now very soft and dazzlingly white. It is sticky in the grinding mills and cannot be sold.

The Mining Industry.

1. Amount of Barite Available and the Output—The entire area is very irregularly supplied with barite, which is commonly mined in patches from 10 to 15 acres in size. The longest single patch is at Mineral Point, where the crest of a low ridge has been mined almost continuously from 50 to 300 ft. wide for a distance of half a mile. The barite, or "tiff," as it is called by the miners, is mostly mined from cleared farm-fields, which showed a little barite upon ploughing and were accordingly prospected. The patches are therefore most frequently upon the slopes of hill-sides, where the barite is likely to be exposed. There are probably several good patches in the woods which have not yet been found, although the country has been prospected for more than a century.

James Long, of Potosi, the largest and oldest shipper of barite, estimates that of the entire area of about 100 sq. miles, one-tenth is workable barite-land. The best fields have produced from 2,500 to 4,000 tons, which is probably only about one-half the barite they contain. The average field, under the present system of mining, yields about 600 tons per acre to a depth of 8 ft., of about 100 lb. per cubic yard, but it takes many

* Published by permission of the Director of the United States Geological Survey.

† Professor of Mining University of Arkansas.

years to produce this amount, and very few fields have been anything like exhausted as yet. Upon this basis of estimate, the probable total yield, without a change in mining methods, will be about 4,000,000 tons, or more than a century's supply, if we count new discoveries equivalent to the amount already taken out.

Every little country store accepts barite in exchange for supplies, but it is all shipped through half-a-dozen contractors. The total amount shipped was given as 33,046 tons. Nearly all of this was first-class barite, and sold for $4.35 per ton at the shipping point, or $5 at St. Louis. In 1905 the price was reduced to $4.10, at which it now stands. The royalty to the owner of the land is quite uniformly 50 cents per ton, but is 80 cents on one especially good field, and as low as 15 cents when very far from the railroad. The miners get as much as $2.75 a ton when much cleaning is necessary, but usually from $2.20 to $2.50, and only $1 a ton at Richwoods, from which the wagon-haul costs $2.50. The haul usually costs from 25 to 50 cents a ton, and the contractor gets the rest. Farm-land containing barite in some of the fields sells at $35 an acre, which is not much different from its farming value. Wild land, from which the best timber has been cut, is worth only from $2 to $8 an acre. Some land, next to the railroad siding, and all containing a little barite was bought at $60 per acre. One ten-acre field near Potosi has yielded a royalty of $200 per acre each year for 10 years, and a neighbouring field, which is supposed to be just as good, is still farmed and held in reserve. About 400 miners are supported wholly by the barite industry, besides those engaged in hauling, etc. So far as I could ascertain, these men do practically no farming, although it is so stated in the books.

2. Mining Operations.—A little barite is still produced from mines extending below water-level into bed-rock, but only when associated with enough lead to pay expenses. The small scale of this work, and the inexpensive farm plant form a striking contrast to the great mines at Flat River, a few miles east. Each shaft usually follows a vertical fissure until a cave is reached, when a drift only 3.5 or 4 ft. high is driven along the little horizontal stringer of galena and barite, which is commonly less than 6 in. thick and carries about 25 per cent. of the lead. Deposits having a cave above or below are naturally preferred, since the cost of blasting is reduced, and in addition large crystals of galena frequently occur on the surface, from which they are easily cobbed off. The little ore-streaks are followed as long as they nearly pay expenses, since they sometimes lead to large and profitable bodies of ore.

Most of the barite is dug from the residual clay. The common plan is to sink a pit, 3 ft. in diameter to a depth of from 6 to 9 ft., to the first lean clay below the upper barite-layer. The miner then selects the richest side of the shaft, which he digs out beneath the upper clay, which is rather barren for from 3 to 6 ft. below the surface. In this way, he "drifts" as far as he thinks is safe, usually from 4 to 8 ft. Up to this stage, all of the clay, flint and barite loosened is hoisted in a small bucket by a primitive hand-windlass; but the miner usually sorts out the barite, which he recognizes from flint only by its greater weight, since it is completely covered with tough, red clay. When the first drift is finished, all the waste from the new drifts is shovelled into it, and the miner digs other drifts wherever the ground looks good, so that the working soon resembles an inverted mushroom.

When the first hole is finished, another is started in the direction that looks the best, at such a distance that the safe drift backward will just connect with the old workings and give a little ventilation. The second hole is exhausted as before, and a third one dug beyond. This plan produces a more or less regular row of pits, and gives rise to the theory of leads. When a lean place is struck the lead is said to have given out, and another row of holes is started, until finally they are scattered over an old field like the squares of a checkerboard, and perhaps one-half of the barite is removed.

I have heard of no accident attending the mining, and since many of these holes remain open for many years, in spite of the rain, it seems probable that the length of the drift is not limited by safety, but rather by the distance reached by daylight, and the greater convenience of working near the shaft, which about balances the labour of sinking a new pit with the ordinary amount of covering. Owing to the tendency to imitate, the size is the same whether there is 2 ft. or 6 ft. of barren cover.

When the upper layer of barite has been exhausted, or the field is very rich, the pits are sunk deeper. In summer, when the ground is cooler than the air, the ventilation is poor, so that the pits are seldom deeper than from 15 to 18 ft. In winter they go to bed rock, or sometimes more than 30 ft. These deeper pits are often worked like the others. The more intelligent miners generally drive drifts from 4 to 6 ft. high for 8 or 10 ft. in three directions, and connect the ends so as to leave pillars. The roof is then caved or stoped upwards and the waste left on the floor. As the space fills up, and the old workings are approached, the area is decreased. The new pit is sunk so close to the last forward drift that but little drifting is required to make the air connection. The connection-drift is often stoped from the second shaft. By careful work, four-fifths of the area covered by the row of workings can be mined; but since the drifts are stopped wherever the ground looks poor, and the pillars are larger than the drifts, and the stopes decrease in size upwards, more than one-half or two-thirds of the ground is seldom mined. Since one row of pits is driven without regard to the others and a good deal of a pillar must be left between rows, at the best, only a small percentage of the barite is recovered. Indeed, so much is left, that I saw no field of pits which was said to be worked out.

As the price paid for mining increases, men will dig around among the old workings, in spite of the annoyance of striking old drifts, even where the pits have been sunk to bed-rock. This shows that much barite is lost between the pits. There is also a loss due to the irregularities in the surface of the bed-rock and the caving-in of unfinished holes by rain. Since the miner leaves the poorer parts, the loss of barite is not as great as the percentage of ground unworked. In a field rather carefully worked to bed-rock, it was roughly estimated that half the barite was lost.

While one man digs the barite, his partner or wife stays on top to work the windlass and with a small tomahawk-shaped hatchet cleans the barite of the clay, the worst iron-stain, and any flint that may adhere to it. In summer a rough sun-shade of branches is built.

Most of the clean barite is in lumps, weighing from 3 lb. (large fist-size) to 20 lb., and the finer stuff is thrown away, except near the railroad. Here the small pieces at the top of the barite pile are piled upon the ground, where the weather loosens some of the clay. This barite is later cleaned in a tumbling-barrel or "rattle-box" and shipped as second grade on account of the larger amount of iron-stain upon it. The rattle-box, shown in Fig. 3, is a strong box, 18 by 30 in. by 10

in. deep, with a slat bottom and the ends thickly studded with strong spikes driven through from the outside. On the sides are uprights of 2-by-4-in. pieces, forming legs 1 ft. long and handles 3 ft. long. From 100 to 150 lb. of small and thoroughly-dried barite is shovelled into the box, which is then rocked upon the feet by two men. When the end of the box strikes the ground, the barite is thrown forcibly against the spikes until all the clay is knocked off and falls through the slats.

The miners receive from $1.60 to $2.75 per ton for cleaned barite, and by working 6 hr per day a pair will usually earn from $6 to $7 in 5 days. Since they can live a week upon this amount, they seldom earn more than $8in a single week, and when a rich spot is struck they spend the time loafing and drinking up the excess earnings. When the ground is lean they work longer.

The miners are usually the most ignorant "gumbo French," and speak no language but their own French dialect, and therefore resist any change in the system of mining. Their scheme has the advantage of all "gopher" mining, that the minimum of barren material need be handled. When the over-burden is thick, this method is probably as good as any, if controlled by an efficient superintendent who would see that the pits are regularly spaced, except where there are real leads. The drifts could generally be higher and longer with advantage.

The Point Mining and Milling Co. installed a pneumatic cleaning pick and mechanical washer, and tried to buy un-cleaned barite at a lower price. By having one top-man for two diggers, the miners earned more money upon this basis; but they did not want to work in threes, and, according to the old arrangement, the top man has plenty of time to clean the barite. Therefore this machinery is not now used.

Some of the better farming land will not be released for barite-mining, since the pits and dumps ruin the land. Occasionally the top layer of barite in a small field is mined out rapidly and more systematically, and the miners are required to put the waste material into the pit immediately behind. When the larger stones are put in first, this mining improves the land.

In two or three cases fields having but little stripping were mined by advancing a trench 6 ft. deep across them sidewise. This method gives much better recovery, and affords a good opportunity of placing the best soil on top and would be used oftener, except that it is hard to get the miners to work for day's pay, and constant supervision is required.

One large company, now bankrupt, wasted a good deal of money upon a traction engine and wooden-rail tramways for hauling, in competition with the Missouri mule in his own home. At the time of my visit, uncleaned barite was mined by day-labour, the clay washed off in a patent trommel-washer, and then the iron and flint chopped off by hand. This system gave a considerable saving, even though the work was inefficiently managed. A little saving was probably due to the greater richness of the newly-opened field, but the method is hopeful.

At the Duffy farm a big company undertook to work for barite hydraulically. The exact arrangement of the sluices could not be determined. On the gentle hill-side above the reservoir is a pit 40 by 80 ft. and about 10 ft. deep to bed-rock. Everything seems to have been well constructed, but the method soon failed for lack of water and of fall to remove the tailings. A little trouble also arose from the depressions in the bed-rock. There are but few places in this field where there will not be trouble with tailings. So it is apparently better to abandon sluices, hydraulic the material over a grizzly, pick out the barite, and remove the tailings by some sort of elevator. The tough clay is hard to handle by water, and labour is so cheap that labour-saving machinery may not pay.

The engineer of the Point Mining and Milling Co. was thinking of mining the residual soil with a steam-shovel, running it through a trommel to shake loose the clay, and carrying the refuse to the dump by belt conveyer, from which the barite should be picked by hand. This system would be especially adapted to the thicker level deposits. The daily output would be very great, and a large crew of pickers would have to be organized, and there would be some expense in handling the tailings. Since much of the land will yield from 125 to 250 lb. of barite per cubic yard of soil, and the cost of mining uncleaned barite by present methods is about $1.50 per ton, this system shows a margin of from 10 to 20 cents per cubic yard for handling by steam-shovel, which is not especially attractive. In localities where water is available, it might be better to treat the soil in a modified log-washer, and pick out the partly-cleaned barite.

In most places the best method of mining seems to be to strip the barren cover with plows and scrapers, and mine the rest with pick and shovel, as is done in Tennessee and in central Missouri, where the deposits are smaller and richer. It had not been tried in Washington County previous to 1905.

Preparation for the Market.

1. The Barite Mill at Mineral Point.—Previous to 1905, most of the barite of Missouri was prepared in the mill of Nulsen, Klien & Krausse, and some by J. C. Fink Mineral & Milling Co., both of St. Louis. The former has a department for making floated barite, resembling that of the new mill at Mineral Point, but a second-grade pigment is also made from unbleached selected barite. These mills are not in Washington County, and it seems better to omit a discussion of them, since they are similar to many other mills which have been previously described.

During 1904 the Point Mining & Milling Co., invested about $150,000 for barite-land and what is claimed to be the largest wet-process mill in the United States. Its capacity is about 35 tons of finished product per 24 hrs., or allowing for delays, about 10,000 tons per year, the mill was designed by W. R. Macklind, who has kindly given me the following data.

The barite is weighed upon a platform-scale and shovelled into the ore-house, which has a horizontal air-drill with chisel point for cleaning the flint and iron from the barite when this is not done by the miners.

From the ore-house the barite is shovelled into an 11-by-16-in. Blake breaker below the floor, which reduces it to pieces of 1in. size. It is then elevated to a 30ton bin at the top of the room, whence it is taken to three modified log-washers in series, in which nearly all of the clay is removed.

The washed barite is wheeled across the floor to two Macklind "slip"-mills or modified arrastres, through which a large stream of water flows, and floats the fine barite over the edge of the pan. This milky water is raised to the top of the mill by a 4-in. centrifugal pump, and fed through a small screen into 12 iron spitzkasten, 4 by 4 ft. in size. The oversize is drawn off through

spigots at the bottom of each box and returned to the slip-mills. The fine barite overflows opposite the entering stream into one of 8 settling tanks, 7 by 9 ft. in size. The clear water is siphoned from these tanks and returned to the slipmill. The thick, cream-coloured barite mud, which contains but 25 per cent. of water, is drawn off through 4-in. plug-valves and a rubber hose to one of 20 bleaching-tanks on the ground floor below.

The required amount of 66 per cent. sulphuric acid is added, and the mass ignited and kept at the boiling-point by a jet of steam introduced through a lead pipe. When the barite becomes white it is drawn off through a plug-valve in the bottom, and raised by an acid-egg to the first of the three Macklind continuous decantation-washers, in which nearly all of the free acid is removed. From the bottom of the last washer the barite is drawn off to one of two settling-tanks, 2.5 ft. deep and 10 ft. in diameter. Here as much clear water as possible is siphoned off and the barite let down into a storage-tank provided with an agitator to keep the barite mobile, since it contains but 15 per cent. of water.

From the storage tank the barite flows to a Macklind continuous automatic drier. A screw-conveyor collects the pellets of barite below the drier and delivers them to a belt-elevator supplying a bin above a Williams hammer-mill which pulverizes these pellets. The product is packed in 100-lb. duck sacks, and stored in a warehouse of 3,000 tons capacity.

The mill is driven by an 18-by-36-in. 200-h.p. Fulton-Corliss engine, running at 75 rev. per min., and supplied with steam at 100 lbs. per sq. in. pressure, by two 72-in. by 18-ft. return-tubular boilers. There are a feed-water heater, duplicate feed-pumps, etc. A 35-kw. direct-connected Westinghouse unit supplies current for lighting the mill, and a Curtiss belt-driven compressor supplies the compressed air.

Besides the superintendent and office-man, there are 12 labourers at $1.50 a day on the two shifts, two slip-mill men at $2, one bleacher at $2, two engineers at $2.50, and two firemen at $1.75, all working 12-hr. shifts. At the time of my visit the mill had not been operated long enough to get reliable data of costs and details of operation were being constantly improved. The cost of manufacture is somewhat high.

Much of the machinery is standard and need not be described. Each unit of the washer consists of a 12-in. screw-conveyor, 10 ft. long, inclined at an angle of 20°. The housing of the conveyor is arranged to hold the water-level high enough to cover two-thirds of the length of the screw. Above this the barite, while being stirred by the screw, is sprayed with about 25 jets of water, ⅛ in. in size, under a 45-ft. head. The edge of the screw-conveyor has a V-shaped notch, 1.5 in. deep, every 4 in., which allows a larger part of the fine material containing the most clay to flow back and be rewashed. At the lower end of the conveyor a strong jet of water washes the mud and a little of the finest barite over the edge of the housing. The barite is fed upon the lower end of the first conveyor and discharged from the top of the last one. These washers have a capacity of about 120 tons of barite in 24 hrs., and consequently are not operated continuously. Each unit requires about 40 gals. of water per minute.

The slip-mills were designed and patented by Mr. Macklind. Briefly, each mill consists of a tub of steel, 10 ft. in diameter and 3 ft. high, which is paved with carefully-cut blocks of Missouri granite. Over this pavement are dragged four granite blocks, roughly triangular, 36 in. on a side and 18 in. thick when new. A heavy three-armed cap is clamped to the top. This cap has four holes about 6 in. apart along the leading side, and the dragging-arm is frequently changed from one to the other of these to change the direction of the drag and prevent corrugations in the bottom of the stone. Once in about 60 days the cap is loosened and the stone turned to present another leading-edge, which makes it wear evenly. At such times the bottom of the stone is rounded slightly. The stone should last for three years, but the wear on the bottom of the mill is about twice as rapid, and is, of course, greatest at the periphery. About once in two years the bottom will have to be raised or renewed.

Among the new features of this mill are an unusually heavy spider, and an arrangement of a weight and lever, like a safety-valve, by which any fraction of the weight of the spider can be transferred to the stones. This is adjusted to suit the different grades of barite. The weight-pin can also be lengthened to allow for the wear on the stone. The rest of the weight of the spider is carried upon a ball-bearing toe-piece raised above the water.

In the old-style mills, trouble was caused by the tendency of the charge to form a self-supporting ring between the stones, which would then rub upon the bottom and wear more rapidly, and even at times break the gear or spider on account of the rapidly-increasing load. In this case the mill had to be stopped and the ring laboriously broken by hand. Mr. Macklind corrected this difficulty by providing the main shaft with a ball-bearing collar, which can be raised 6 in. by steam or compressed air piston. This also raises the stones, and the water soon causes the ring to collapse. It seems that this difficulty would be avoided if the distance between the stones were made greater by decreasing their number or increasing the diameter of the mills. according to the Mexican style. Mr. Macklind's scheme, however, has the incidental advantage that when the stones are raised the spider can be easily revolved by hand for inspection or repairs or for cleaning out the mill. In starting up it can also be brought to its normal speed of 20 revolutions per minute by hand, so a simple positive clutch can be used on the gear.

When the mill is grinding properly, the stones tremble or chatter noticeably, and the gearing runs without noise. When one of the stones begins to rub on the bottom the groaning of the gear should be immediately noticed by the attendant, who then raises the spider for a moment. The mills should have about 8 in. of barite in the bottom, and the attendant sounds them with a rod to determine the need of more feed, but of course soon learns how rapidly to shovel in the barite. At 20 rev. per min. each mill has a capacity of from 15 to 18 tons per 24 hr., but generally 12 or 13 tons is ground, and this output determines the capacity of the entire plant. About 15 h.p. is required for each mill.

The water flows through this mill at the rate of 100,000 gal. per 24 hr. This large stream of water may be necessary to provide for an increase in the capacity of the mill, but since more than 40 h.p. is required to raise the water 45 ft. to the separating tanks, it does not seem to be as economical as increasing the number of mills. The number of spitzkasten was increased in order that the floated barite should be fine enough. It is said that this fine barite was examined with a microscope, and the largest pieces were small enough to go through a 300-mesh sieve. The stream is divided

equally among all the boxes, and enters through a fine screen to reduce the agitation. This screen also removes a few small pellets of clay and chips of wood. There is also a vertical screen in the middle of the box to prevent the formation of eddies.

The bleaching tanks are lined with three lengths of 36 in. sewer pipe without bells, and four special tiles form a cone-shaped bottom. They are made waterproof by an 8 lb. hard-lead covering on the outside. The hydrostatic pressure is resisted by oak staves and iron hoops outside the lead. The tanks are charged with 2 tons of settled barite, containing 25 per cent. of water, and a minimum of 240 lb. of 66 per cent. sulphuric acid is added. The acid is received in tank cars, and costs a cent a pound. It is run into a large steel storage tank, from which it is pumped by an acid-egg to an elevated lead-lined tank; thence it flows through lead pipes and valves to the bleaching-room on a level with the top of the bleaching tanks. Here it is handled and measured in a small lead-lined tank car. After the acid is added, steam is run into the bottom of the tank to agitate the mass and heat it to nearly the boiling point. At first, lead-lined iron agitators were used, but they wore out very rapidly. The tile lining of the tanks protects the lead from all mechanical wear, and it soon becomes coated with lead sulphate.

It requires about 45 min. to heat the mixture, and the best quality of ore can be bleached in from 6 to 7 hr.; but since there is plenty of tank capacity, the bleaching is always continued 12 hr. or more. If the bleaching is not finished in 12 hr., more acid is added; but it is unsafe to reduce the amount below 120 lb. per ton, on account of uncertainties as to the ore. No attempt is made to save the unused acid. To tell when the bleaching is complete, a 2 oz. bottle, full of barite, is compared as to colour with a standard sample.

The bleached barite is drawn off through lead-covered plug-valves in the bottom. The handling of this hot, thick, heavy, and corrosive material has proved very troublesome. It has been most successfully pumped to the washing tanks by a very heavy acid-egg.

These washers, designed by Mr. Macklind, consist of lead-lined iron tanks, 10 ft. in diameter, 19 ft. high, having a cone-shaped bottom. In a lead cup above the centre of the tank the bleached mud is mixed with a strong jet of water, and then distributed by a flat lead cone to the circumference of the tank and discharged upon baffle-plates. In the centre of the tank is a bottomless lead cylinder, 8 by 8 ft., inside of which the water rises so slowly that all the barite settles out, and only clear acid water is discharged to waste through a lead pipe at the surface.

From the bottom of the first washer the barite passes to a similar one 3 ft. lower. From this it goes to a third one still lower. Since, with this head, the heavy settled barite would not flow from the bottom of one tank to the top of the next, the current is maintained by a strong jet of wash water directed upwards in the discharge pipe. (A similar arrangement might be serviceable in elevating the thick barite from the bleaching tanks.)

All the acid should not be removed, or the barite will immediately turn a light yellow; the end-point used to be determined by a slight acid taste, but the washing is now continued until there is no taste, but the iron sulphate remaining in solution will give a slight blue colour with potassium ferrocyanide, thrown upon the last spreading cone. When this does not show, the quantity of wash-water is reduced. The reason for the change of colour when no acid is present is not understood. This acid prevents the use of floated barite for weighting rubber and paper, but for paint it is not objectionable. If the settled barite mud at the bottom of the washer has 50 per cent. of water, this leaves about ⅛ lb. of acid to the ton of barite; if it has 100 per cent., which is more likely, 1 lb. to the ton will be left.

The wash-water is filtered through six sand-filters, 36 by 60 in., and is obtained from a small creek by a separate pump. The general mill supply is filtered only when very muddy.

The essential part of the Macklind drier is a cylinder of wrought iron pipe, 36 in. in diameter and 8 ft. long, revolving one and a half times per minute, and heated inside by live steam. Upon this cylinder the barite is dropped by a plate shaken 200 times per minute by a cam. The thick, settled barite mud is fed upon the shaker-plate in fine streams 4 in. apart through pin-valves from the feed-trough, which contains an agitator to prevent packing. The drops of barite falling upon the hot drum are soon dried and are scraped off by a plate after nearly a full revolution. This scraper leaves a thin layer of strongly adhering barite, which prevents discoloration from the iron. The live steam enters through a stuffing-box at one end, and the condensed water is drawn off through a siphon-pipe in the other trunnion and circulates through coils along the side of the housing, and dries whatever barite is spattered off by the boiling pellets.

To prevent the accumulation of air in the cylinder, some steam is drawn off through a straight pipe entering through the siphon and carried to the bleaching tanks.

The finished barite is tested for colour by putting a spatulaful upon a glass plate beside a standard sample, smoothing it down beneath a piece of paper, and comparing as to colour. It is then moistened with turpentine and again compared. In this way it shows as white as a standard sample of white-lead, which had a slight buff color, but not as white as good zinc oxide, which is blue in comparison. The product is tested for grit by rubbing it with a spatula upon soft glazed paper, which should not be scratched. Barite which contains flint will be apt to show more grit when floated, since the equal-falling grain of quartz is so much larger than the heavy barite. Barite ground between burr-stones gets grit from the mills. In the wet-process mill, in which the barite is ground before bleaching, hard iron or steel could be used in the mill and the pigment would be entirely free from grit if the barite contained no quartz.

Barite, on account of its prismatic cleavage, forms a "sliver" pigment rather than a granular one. These slivers mat together in the paint, and since barite is slightly harder than the other pigments, it forms a more durable paint. It is also entirely unaffected by weather, and does not dissolve like zinc, or blacken with sulphur like lead.

White-lead is said to saponify linseed oil. At any rate, after a few years, a pure white-lead paint will chalk and rub off, leaving the surface in good shape for a second painting. So far as known, zinc is not used alone, but if the paint contains too much barite it peels off and a second coat of paint will not stick. The mixture of white-lead and barite pigments is therefore better than either one alone. Some of the peeling may be due to inferior oil.

When barite is sufficiently ground it will spread well. The chief objection to it is its translucency and

lack of covering power. This deficiency is best corrected by zinc oxide, which has the greatest covering power. Some of the paint men therefore say that an equal proportion of the three pigments makes the best paint. The unfortunate feature is that usually good barite costs less than a cent a pound, while the other pigments cost 6 or 7 cents, so that much of the prepared paints contain too great a proportion of barite, up to 60 per cent.

Very little barite is now used in making fine book paper, since the weight of a book is no longer considered an advantage, and fibrous talc is used instead. Its use in rubber goods seems to be a trade secret.

For making barium salts a very inferior barite can be used, but most of this chemical manufacturing work is done in Europe. There would be a big demand for barium oxide for treating boiler water containing much calcium and magnesium sulphates, but it is not yet supplied cheaply enough in the United States.

CANADIAN MINING INSTITUTE—WESTERN BRANCH.

The seventh general meeting of the members of the Western branch of the Canadian Mining Institute will be opened at Vancouver, British Columbia, on Friday Morning, February, 25, 1910.

Members are requested to rendezvous at the Hotel Vancouver at 11 o'clock on that morning, when the place of meeting will be announced and the business be commenced forthwith.

Business Agenda—

1—Reading of Annual Report of Secretary of Western Branch.

2—Appointment by Chairman of meeting of Scrutineers to examine ballots for election of Chairman of Branch for the year 1910. Result of ballot to be announced before the final adjournment of meeting.

3—Routine Business, if any, at pleasure of meeting.

4—Reading of papers and discussion of these and other suitable subjects.

It is proposed to discuss several papers presented at previous meetings, also any other matter bearing upon the Mining and Smelting industries of the West that shall be brought before the meeting. The suggestion is made that mining for placer gold, copper, iron and coal being of particular interest in the Coast District, these have the attention of the meeting. Members can easily make the meeting both interesting and useful by taking part in conversational discussions on such subjects. Expressions of opinion relative to the advantage or otherwise of gold recovered in Western Canadian mining districts being purchased by the Federal Government are also invited.

The provision of facilities for the early development of the mineral resources of Northern British Columbia is another important subject worthy of attention.

Ballot for Members of Branch Council—This will not be taken until after the result of the next Annual Election of Members of the Council of the Institute shall have been made known. Ballot papers will be sent to all members of the Western Branch next month (March) after it shall have been ascertained who of the Western members are members of the Council of the Institute and consequently ex officio members of the Branch Council. In this connection it is respectfully requested that if a ballot for Members of Council of the Parent Institute be taken, all Western Members will make a point of marking their ballots for the six Western Candidates and returning them to Montreal in ample time to be effective.

Finances—The Branch Council has been informed that nearly one-third of the Western Members are in arrears with their annual dues. Members are reminded that if dues be not promptly paid, the work of the Branch is hindered, since it is only entitled to a proportion of the moneys actually received by the Treasurer of the Institute, Montreal, from Western Members.

Please Note.—That all members of the Canadian Mining Institute in good standing residing in Western Canada and neighbouring parts of the United States are by virtue of such membership, also members of the Western Branch. Members are earnestly requested to make an effort to attend the ensuing meeting, and are cordially invited to contribute papers or notes on suitable subjects, and to take part in the discussions at the meeting. Non-members taking an interest in the objects and work of the institute will also be welcome, both to attend and join in the discussions on papers, etc., submitted.

E. JACOBS,
Secretary of Western Branch of the Canadian Mining Institute.

Victoria, B.C., February 1, 1910.

MINING IN AINSWORTH AND SLOCAN DISTRICTS.

By E. Jacobs.

The total quantity of ore produced by mines in Ainsworth and Slocan parts of West Kootenay District in 1909 was approximately 150,000 tons, in the proportion of 104,000 tons from mines in Ainsworth division and 46,000 tons from those in Slocan. The larger producers in Ainsworth division were the Canadian Metal Company's Blue Bell mine, on the east side of Kootenay Lake, opposite the town of Ainsworth, 60,000 tons; the Whitewater and Whitewater Deep, 28,000 tons; and the Selkirk Mining Company's Cork mine, on the south fork of Kaslo Creek, 15,000 tons. There were fifteen other shippers, ranging from 320 tons down to only a couple of tons, the latter of dry ore rich in silver. In Slocan division, the Van Roi Mining Company produced rather more than 28,000 tons; the Lucky Jim, 5,000 tons; the Consolidated Mining and Smelting Company's Richmond-Eureka and associated Summit mines, approximately 3,500 tons; the Standard, on Four Mile Creek, 3,000 tons; the Hope mine of the Ruth Mines, Ltd., group at Sandon (including both silver-lead and zinc concentrates), about 2,000 tons, and the Rambler-Cariboo in excess of 1,000 tons. The smaller shipping mines numbered 18 or 20, with an output of 668 tons for the highest down to half a dozen tons of high-grade dry ore for the lowest. The aggregate tonnage above shown does not agree with that appearing in other ore production statistics recently published, the reason being that in some instances the figures now given include

ore mined and not shipped, but stored for milling later when facilities for concentrating it shall have been provided at mines at present without them.

It will be noted that the information already given relates to less than 50 mines, but there are others upon which development work was done during the year which did not ship any ore. If the total number of properties upon which mining was done in 1909 be placed at 70, say 30 in Ainsworth and 40 in Slocan division, it will be well within the mark. Further, the total value of the mineral production in 1908 is on official records as: Ainsworth division, $422,181; Slocan, $676,580; total, $1,098,761. The estimated value of that for 1909 is: Ainsworth, $932,134; Slocan, $1,073,080; total, $2,005,214. The latter indicates an increase of 82.5 per cent. in total value, and this notwithstanding that the difference in average prices at which the respective calculations were made is against 1909 to the extent of nearly 14,600.

That there is a distinct improvement in the condition of the mining industry of Ainsworth and Slocan mining divisions is known to those who are well informed concerning the situation to-day, but it has over so long a period been the custom for those not possessed of the facts of the case to take it for granted that the available mineral resources of these parts of the West Kootenay district are practically exhausted, that the gradual yet substantial improvement in the position which has marked recent years has not been recognized by more than a comparatively small minority of the general public, even in the Kootenay district itself. However, production statistics should convince the most sceptical, so they are now quoted, and it should be kept in mind that, save for the year 1909, which have been estimated by the writer after careful enquiry and compilation, they are official, having been taken from the Annual Reports of the Minister of Mines for British Columbia. They are as under:—

Year.	Ainsworth.	Slocan.	Total.
1905	$100,273	$970,544	$1,070,817
1906	268,111	532,228	800,339
1907	364,868	619,842	984,710
1908	422,181	676,580	1,098,761
1909 (estimated)	932,134	1,073,080	2,005,214
Totals for 5 yrs.	$2,087,567	$3,872,274	$5,959,841

These figures show that in 1909 Ainsworth mining division more than doubled its highest previous year's record (that of $440,545 in 1897), while those for Slocan are greater in total value than those of any other year since 1904. It should be explained that zinc and marble to a total value of about $280,000 were included in the estimate of the value of the mineral production of Ainsworth division in 1909, but even after making allowance for these there remains an increase of approximately $212,000 over the previous high record in total value—that for 1897. But since prices fluctuate year by year, the most satisfactory comparison is that of quantities of metals produced, and these are exhibited in the next following tables:—

Ainsworth Division.

Year.	Silver, Oz.	Lead, Lb.
1905	99,781	1,002,114
1906	165,915	3,173,353
1907	301,322	3,654,775
1908	314,142	4,790,216
1909 (estimated)	494,350	10,748,220

Slocan Division.

1905	1,045,948	5,399,330
1906	571,613	2,975,674
1907	590,998	4,305,826
1908	848,595	6,572,268
1909 (estimated)	1,005,603	6,297,897

The respective prices at which value was calculated for the several years were as under:—

	Silver, per oz.	Lead, per lb.
1905	57.33 cents	4.24 cents
1906	63.45 "	5.09 "
1907	62.06 "	4.80 "
1908	50.22 "	3.78 "
1909	49.00 "	3.80 "

To show the difference varying prices make, it is pointed out that the total value of the silver and lead produced in the Slocan in 1909 would be approximately $225,000 more if calculated at the average prices for those metals obtained in 1906, which were the highest average prices in the five years under notice, than is shown as the result of the calculation at the average prices for 1909. This would appear to make evident the greater reliability of a comparison of quantities of minerals produced in different years rather than of values, since the latter fluctuate, as shown above.

Zinc Smelting Problem of Moment.

The early solution of the problem of how to utilize at profit the large quantity of zinc ore occurring in the Kootenay, particularly in Ainsworth and Slocan districts, is of much moment to local mine owners, for zinc is found in considerable quantity in most of the larger mines. Usually it is in association with lead, and in some mines there is also much iron. Indeed, so complex are some of the ores that the separation of lead, zinc and iron cannot be effected by the ordinary water concentration process prevailing throughout the district under conditions and on a sufficiently large scale to make operations in this connection profitable to mine owners. Hence the community of interest and unity of recent action in urging upon the Dominion Department of Mines the great importance of the Federal Government making provision for prolonged object of determining how the zinc ores of Canada can be profitably treated.

Several mining companies operating in the district under notice have already overcome some of the difficulties that earlier were in the way of the zinc content of their respective ores being made marketable, but there are many others, and among them numbers of owners of properties that, so far as yet developed, are comparatively small, whose mining operations are practically at a standstill consequent chiefly upon their inability to profitably utilize the zinc ores, or the zinc content of the silver-lead-zinc ores occurring in quantity in their mines. The chief exceptions are the Lucky Jim Mining Company, which possesses much zinc ore of such a nature as to admit of its being sent to the smelteries without having to first be put through any concentration or separation process; the lessees of the Whitewater group; the Ruth Mines, Ltd., and the Van Roi Mining Company. These were the only British Columbia shippers of zinc ore or concentrate as a marketable product during the year 1909. It is probable two or three others will be added to the list in 1910, for both the Payne and Slocan Star have zinc-saving appliances installed in their respective concentrating mills, and it is hoped the Canadian Metal

Company's Blue Bell mill will also shortly produce a saleable zinc product as well as a lead-silver concentrate. The Van Roi Mining Company plans to make provision in the mill it is preparing to build and equip for separating the zinc from the other metal contents of ore from its Vancouver group of mines, and in doing this the management will have the benefit of the experience gained in operating the Wakefield mill on its ores, for the company worked that mill under lease during 1909, and is still operating it, until such time as the Silverton Mines, Ltd., shall require possession of it to treat ores from its Hewitt-Lorna Doone group, in which mine there is also much zinc ore.

The companies and mines named above are but a small minority of those deeply interested in the zinc ore treatment problem, the satisfactory solution of which would result in a transformation as regards the output of ore from Ainsworth and Slocan. That the difficulties now in the way of zinc ores being mined generally throughout the district will eventually be successfully overcome, those chiefly interested are hopeful of. Meanwhile developments of new processes and improvements in old methods of treatment are of almost universal interest to local mine owners, who expect that it will yet be profitable to turn to good account the zinc ores that have heretofore been found a detriment and a loss.

THE HISTORY OF STEVENS' COPPER HANDBOOK

Written for the Canadian Mining Journal by Horace J. Stevens.

[Editor's Note.—The following sketch was written at the request of the Canadian Mining Journal. The Copper Handbook occupies a unique place in periodical literature. It is almost inconceivable that it is the product of one man's labour. This, however, is literally true. We consider the subjoined history inspiring and interesting.]

Like many other works of reference, the Copper Handbook had a small and most casual beginning. While I have lived in the Lake Superior district since boyhood, I did not locate in Houghton until 1894, and then, as I was writing about the local copper mines, I soon felt the need of reliable data regarding the local properties. This I found to be scattered through a great many different publications, with many a hiatus between. The best works of reference regarding the local mines were the annual reports of the Michigan Commissioners of Mineral Statistics, but this having been a political office, some of the commissioners neglected to issue annual reports, and the statistics were very incomplete.

Finding that there was no work published that would meet my requirements, I began collecting data for myself, and filing same in some sort of system. It occurred to me that a pamphlet, giving bare facts regarding the Lake Superior copper mines, would meet with favour, and the first man with whom I talked over this idea was the late Jas. B. Sturgis, of Houghton. Mr. Sturgis approved of the idea warmly, and suggested that I prepare and print a pamphlet, immediately, embodying this material. I did not feel, however, that the data at hand were sufficiently complete, and continued collecting and collating and filing material.

During the big copper boom of 1898-99, Messrs. Russel and Hornstein, of the Marquette Mining Journal, decided to print a pamphlet on Lake Superior copper mines, and requested me to prepare the historical and statistical sections. I explained that I was too busy to attend to the matter, and furthermore would be absent, but Mr. Hornstein assured me that, relying upon my collaboration, they already had committed themselves to the printing of such a pamphlet, and in fact had sold about 15,000 copies, before bringing the matter to my attention.

By reason of old friendship, I prepared short historical and statistical summaries for the publishers of this book, writing under great disadvantages, in Boston, while my reference library and files were in Houghton. The publication issued by the Marquette Mining Journal bore the somewhat ambitious title of First Annual Review of the Copper Mining Industry of Lake Superior, making 189 pages, in demy octavo, set in brevier type, of which about 75 pages were written by me, this book being issued in the spring of 1899.

In 1900 I advised Messrs. Russell and Hornstein that I had been gathering matter for six years for a copper

J STEVENS.

manual of my own, and they advised me that they had no desire to issue another edition of the Annual Review of the Copper Mining Industry of Lake Superior, as that work had been sold mainly in quantities, to brokers and promoters. A few weeks later, Mr. Jas. Russell was appointed Commissioner of Mineral Statistics of the State of Michigan, and requested me to act as his deputy and prepare the annual report. This I did, arranging with Mr. Russell that the copper section of this report should be reprinted and copyrighted by myself, individually, as a separate book, and, this being done, the copper section of the report of the Commissioner of Mineral Statistics for 1900 became Vol. 1 of the Copper Handbook.

The exigencies of politics separating Mr. Russell and myself, as his deputy, from the pay-roll of the State of Michigan, after eighteen months only, although the usual term is two years, I prepared, without payment therefor, and Mr. Russell printed at his own per-

sonal expense, a second annual report to the State, but this had no connection with Vol. II of the Copper Handbook, which since 1901, has been an entity.

The first volume dealt with Lake Superior mines only, and its arrangement left much to be desired. Vol. II was put out in somewhat better form as to arrangement of matter, and the two chapters in Vol I, devoted respectively to idle and active mines of Lake Superior, were consolidated, and, in addition, several short preliminary chapters were given, devoted to the history, chemistry, mineralogy and metallurgy of copper, with a glossary of common mining terms and a chapter devoted to the copper deposits of the world. There also was a chapter, of 13 pages only, devoted to leading foreign mines, and a chapter of 68 pages devoted to American copper mines outside of Lake Superior, while Chapter X included various statistical tables.

With the issue of Vol. III, the work was put into substantially its present shape, though the number of preliminary chapters has been added to since, and all copper mines were treated in alphabetical order, regardless of location. While this plan has serious disadvantages, on the whole it is considered the best system for presenting the descriptions of the various properties. In Vol. 111 the number of titles of mines was 2231, comparing with 6767 titles in Vol. VIII, the last edition.

The preliminary chapters have been re-written and amplified for several editions, but not for each successive issue, the preliminary chapters in Vol. VIII being the same as in Vol. VII, but the long chapters, devoted to mine descriptions, and that pertaining to statistics, have been re-written for each edition, with the exception of Vol. VII, issued in 1907, in which case the mine descriptions remained unchanged from the previous issue owing to the loss of about half of that year through an unfortunate combination of fire, sickness, surgical operations, and unavoidable absence.

As an average of nearly fourteen months has been required for each edition of the book, all of the work being done by myself, notwithstanding the general impression that I have a large number of assistants, Vol. VIII, dated 1908, was issued only May last, and, in order to catch up with the years, I find that it will be necessary to issue Vol. IX with merely a revision of the statistical chapter, and the addition of a short chapter giving descriptions of new properties, which will be about 1,000 in number. This will not be altogether a satisfactory book, but it seems the only way out of the unfortunate situation in which I find myself placed, as I cannot afford to allow an annual to miss a year's issue, and it will require nearly a year to revise completely the full mine descriptions. All old subscribers will be notified of the shortcomings of Vol. IX before its issue, as was done with Vol. VII, which, for reasons already given, was not up to the usual standard.

The annual average of the world's gold production jumped in the year 1721, and continued abnormally high until 1810. After the latter year it fell to the mark set before 1721. The annual average for the period 1701-1720 was about $8,520,000. For the period 1721-1810 the world's production fluctuated between $12,000,000 and $16,000,000. During this period of 90 years the placers of Brazil were contributing hugely to the world's stock of gold.

CORRESPONDENCE.

Editor The Canadian Mining Journal,

Sir,—In The "Journal" of February 1st, there was an unsigned article entitled "The Nickel Industry." It would deserve no attention except that it contained certain mis-statements identical with those made on January 19th, before the Mines and Minerals Committee at Ottawa. The Committee now knows that the statements were incorrect.

What is the motive that prompts such inaccurate statements? If accurate information about the industry is desired, it is not difficult to obtain, and will show that the world's annual consumption of nickel is not 18,000 tons; that there is not an agreement between producers to keep up the price of nickel; that the profits of the International Nickel Company are not and never have been $3,000,000 per annum, and that there is not a combination or monopoly that prevents others embarking in the business.

The article in question indicates that there is some sentimental feeling for the Sudbury nickel deposits, but its false statements, whether made through ignorance or sentiment, are mischievous.

Yours truly,
A. P. TURNER, President,

The Canadian Copper Company, Copper Cliff, Ont.
February 10, 1910.

Toronto, February 4th, 1910.

Editor Canadian Mining Journal, Toronto:

Sir,—It is with great pain and reluctance that I take up the pen to pass strictures on your evident lack of appreciation of the relative importance of accuracy as compared with piquancy of diction. But the divergences from "Reason's dusty way" are too frequent, and I feel I must call you back. In your last issue, February 1st, p. 67, the amount of land in arrears for taxes and subject to forfeiture in the Kenora and Rainy River District was given you as 86,779 acres, or 45% approximately (i.e., of the area in those districts subject to taxation), whereas the figures printed in that issue were 4,072 acres, or 29%. This is quite a noticeable difference. A glance at the statement published would show that it is incorrect and does not agree with the amount given before as the total area.

I think I know the reason; you have been influenced too much by the advice of the poet quoted below. Could you not in future strike a better balance between accuracy and fancy? The poem is by an unknown, and was suitably illustrated by a representation of a sage and a beautiful maiden, which you can no doubt picture to yourself. Personally, I rather admire your taste for showing a preference to the maiden:

Grau ging und grämlich der Verstand
Den Weg der Theorie,
Da nahm ihn lachend bei der Hand
Die blonde Phantasie.
Sie zog das Buch aus seinem Rock
Und schüttelte ihr Blondgelock
Und war so hübsch wie nie.

Er wollte ihr zürnen könnt'es nicht
Sie schien so wunderbar
Er sah ihr kindlich Angesicht,
Und strich ihr übers Haar
Und leichter rascher ward sein Schritt,
Sie zog ihn nach sie zog ihn mit
Bis er am ziele war.

This has been translated by Dr. Ellis as follows:—

With weary footsteps Wisdom trod
In Reason's dusty way,
When Fancy, with alluring nod
Once tempted him away.
Laughing, she snatched away his book,
Her golden curls she gaily shook,
Ah, who so fair as she!

Who could resist such winning grace?
Her beauty charmed his soul.
He gazed into the childlike face,
His arm about her stole.
And lo! his weariness was gone,
She led him up, she led him on
Till he had reached the goal.

Yours, etc.,
G. R. MICKLE.

CANADIAN PATENTS.

The following is a list of Canadian patents granted on Jan. 25, 1910, relating to mining and metallurgy, and furnished by Fetherstonhaugh & Co., 5 Elgin St. Ottawa, Canada, Russel S. Smart, resident, from whom all information regarding same may be obtained:

123345. W. H. Gregg, Cambridge, Ohio, safety apparatus for mine railway.

123360. A. R. Freedmann, Piqua, Ohio, shaft braces, The Pioneer Pole and Shaft Co.

123370. H. W. Bresler, Charlottenberg, Germany, processes of producing metallic tungsten.

123412. A. S. Dwight, New York, apparatus for roasting and suntering ore.

123428. W. Hancock, Township of Snowdon, County of Haliburton, Ont., composition of matter to be used for the purpose of a high explosive.

RESOLUTIONS ADOPTED BY THE CANADIAN COMMISSION OF CONSERVATION.

Resolution respecting waters and water-powers, adopted at the annual meeting, January 18-21, 1910:—

That in future no unconditional titles to water-powers should be given, but that every grant or lease of powers should be subject, among others, to the following conditions:—

(1) Development within a specified time.
(2) Public control of rates.
(3 A rental with the power to revise same at a later period.

Resolutions of Executive Committee.

At a meeting of the Executive Committee of the Commission of Conservation on February 2, 1910, the following resolutions were adopted:—

1. That a memorial be prepared and submitted expressing the opposition of the Commission to the proposition to dam the St. Lawrence at the Long Sault, or to any similar proposition involving the construction of a dam across the St. Lawrence.

2. That the meeting records its opposition to the export of power at Fort Frances being authorized by the Government.

PERSONAL AND GENERAL.

Messrs. Webb and Cooke, power specialists and industrial engineers, have taken offices at 338 Ellicott Square, Buffalo, N.Y.

Due to fast-increasing business, both the Chicago and Baltimore branches of the H. W. Johns-Manville Co. have outgrown their present quarters, and about March 1st both will move to new locations, with more room. The Chicago branch, now on Randolph Street,

PERSONAL RATHER THAN GENERAL.

will move to the four-storey-and-basement building at Nos. 27-29 Michigan Avenue, located in the block between South Water and River Streets. With 32,500 square feet of floor space, offices, store, and stock-rooms will all be under one roof, with ample room for all. A full stock of J-M products will be carried, thus assuring prompt shipments. The Baltimore office, store and warehouse will be located at No. 30 Light Street. Here the company will have considerably more room than before, and will keep on hand a large stock of J-M products, and will be in much better position than ever to give all orders prompt attention.

Mr. J. J. Harpell has returned to Harrow, England.

Mr. P. N. Nissen is in Toronto.

Mr. A. B. Willmott has moved from Sault Ste. Marie to Toronto, where he will have his headquarters for some time.

Mr. H. P. Davis is to address the Canadian Club, New York, on the evening of March 8th. The subject chosen is "The Development of Mining in Northern Ontario." Mr. Davis has arranged for a display of typical specimens from Cobalt, Porcupine and Gowganda.

BOOK REVIEWS.

Metal Statistics, 1910. Published by the American Metal Market Co., 81 Fulton Street, New York. Price 50 cents.

In this little annual are many useful statistics. Figures of production, price fluctuations, etc., are given for iron, steel, copper, tin, spelter, lead, antimony, gold and silver. Many other serviceable data are included.

The Mining Manual 1910. By Walter R. Skinner. Price $5. For sale by the Canadian Mining Journal.

We have given frequent notices of this invaluable manual. It is too well known to require more than brief mention for its new edition. Those of our readers who are unacquainted with the book will be surprised to learn that it contains particulars of 3,600 mining companies operating in all parts of the world.

To the consulting mining engineer Skinner's Manual is particularly necessary.

The Colliery Manager's Pocket Book, Almanac and Diary for the Year 1910. Edited by Allan Greenwell, editor of The Colliery Guardian. Published by the Colliery Guardian Co., Ltd., 30 and 31, Furnival Street, Holborn, London, E.C. Price $1, $1.25 and $1.50, according to binding.

For forty-one years the Colliery Manager's Pocket Book has made its annual appearance. In addition to an almanac, a very convenient diary, cash account, blank memoranda pages, etc., etc., much general information and statistics are presented. On such subjects as rescue work, estimation of noxious gases, and other pertinent topics, special articles are given. Numerous working formulae, tables for calculations, surveying data, have been included. Careful editing and selection are apparent.

The exceedingly moderate price of the volume puts it easily within the reach of all. Its usefulness is beyond question. The imprimatur of the Golliery Guardian goes far towards assuring the merit of any publication.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay, Feb. 15.—The Dominion Coal Company's output for the first half of February amounted to 105,000 tons, being a daily average production of 8,800 tons. Banking-out coal was commenced in January, and despite the supposed state of strike it is expected to accumulate a fairly large stock-pile against the opening of navigation, which from present indications will be earlier than usual. The river ice in the St. Lawrence has been very light this year, and so far no drift-ice has made its appearance on the Cape Breton coast. Persons experienced in St. Lawrence navigation predict that the river will be open before the middle of April.

An accident which happened at Dominion No. 2 on the 14th proved once more the usefulness of the safety detaching hook. Owing to the loosening of a pin in the reversing gear of the Phalen man-engine, the descending cage with eighteen men aboard was dropped without proper control into the pit-bottom, while the ascending cage was drawn up into the head-frame, and safely suspended by the operation of the "butterflies." Two of the men in the cage sustained broken legs and six others received slight injuries and shock. The remaining ten men were uninjured.

The regular work of training at the Coal Company's Rescue Station has been seriously interfered with by the strike conditions, but the work has been resumed under the more normal conditions now existing. The company has just added to the equipment of the station twenty of the Hubbell type electric handlamps. Lamps of this type have been in use at the station for about two years past, and have proved satisfactory and durable.

The United States Government has recently ordered that apparatus for rescue work in mines and all the accessories connected therewith are to be placed on the free list and exempted from all Customs duties. This is a precedent which it would be well for our own Government to follow. Under a special Order-in-Council the duty payable under the tariff has been remitted in several instances on mine rescue apparatus, but at present it is necessary to make payment of duty charges on imported rescue apparatus—and it is necessarily imported, because no such apparatus is manufactured in Canada. Rescue apparatus for work in mines should come under the same head as fire appliances for fire brigades, or life-saving devices for humane societies, but the Customs authorities do not take this view. It is to be regretted that the coal-mining industry of Canada has not a representative in the House of Commons, who could lay this and many other matters which relate to the welfare of the industry before our legislators. Of some learned professions, notably the legal profession, the Legislature contains a superfluity, but the profession of the mining engineer is conspicuous chiefly by its absence from Parliament. Recent events in the United States have proved how useful and necessary some form of oxygen breathing apparatus is after a mine explosion. In most of the civilized countries of Europe—and in some that

we might here regard as more or less uncivilized—the provision of rescue apparatus at coal mines is made compulsory by law. This is not yet the case in Canada, although several requests have been made of late by coroner's juries that the same rule should obtain here. However, it would seem that the least the Federal Government could do to encourage the provision of these very necessary appliances is to exempt them from Customs duties. Any doubts which may arise as to the necessity and usefulness of oxygen rescue appliances can easily be dispelled by a perusal of the recent report of the British Royal Commission on Mines, which deals with this subject.

Another matter which is more open to opinion is the question of Provincial certificates of competency for mine managers and under-officials. At the present time each coal-mining Province will recognize only those certificates of competency which are issued in that particular Province. The Nova Scotian manager who goes to Alberta must sit again for an Albertan certificate, and so in every other coal-mining Province. It is to be feared that in many instances the granting of Provincial certificates is not in accordance with the best ethics of the mining profession, and this is so well-known that it is not necessary to particularize. Would it not be possible to issue certificates of competency from a central examining board under the direction of the Federal Government assisted by the faculty of the large Canadian universities? The examination would be a rigorous one, safeguarded by the usual qualification of experience underground and proper technical training, and possibly the application of such a certificate would need to be supplemented by a certain length of residence in the Province where it might be used. The present rate of expansion in the coal-fields of the West is going to drain the eastern mines of qualified men, and at the same time there is reason to believe that the eastern mines will before long see a great development. The free exchange of competent men from one Canadian Province to another should not be hindered by Provincial laws, unless there is very good reason for them, nor should the exigencies of the moment be allowed to bring into disrepute the value of certificates of competency.

The U.M.W. vs. the N. S. Coal Operators.—Mr. J. R. Cowans, the General Manager of the Cumberland Coal and Railway Company, and Mr. Alex. Dick, the General Sales Agent of the Dominion Coal Company, were committed to the Supreme Court in Halifax on a charge of conspiracy to limit the facilities for producing coal in Nova Scotia, to lessen competition and to unreasonably enhance the price thereof. The suit was brought against the two gentlemen named by a nominee of the United Mine Workers of America, and the costs of the prosecution have been paid by that organization. The magistrate refused to make public his reasons for his decision. It is probably sufficient for the public to know that this prosecution was instituted by the U.M.W. against representatives of the two coal companies at whose works the U. M. W. have called a strike. It is interesting to note in this connection that Mr. Tom Lewis the President of the U.M.W., is said to have made the remark at the Toledo Conference that the miners of the United States must have higher wages, and that if the price of coal was too low to give the operator a working profit, the price of coal must be increased. This is good logic in the United States, and it is good logic in Nova Scotia. The organization which sanctions a special reduction in the wage scale of United States coal mines in order to enable these same mines to compete with Nova Scotian coal in the Montreal market, while at the same time it calls a strike in Nova Scotia for higher wages and shorter hours accompanied by the prosecution above referred to, would seem to be run more in the interests of the American coal operator than in the interests of the miner either here or in the United States.

ONTARIO.

Kenora.—A meeting of the Prospectors' and Mine Owners' Association of the Kenora Mining Division was held on Tuesday, February 8th, at which a report of the By-law Committee was accepted. Amongst the new by-laws for the association the most important was that one making the dismissal of any member who made use of the association for wild-cat schemes compulsory. Its wording was:—

"Any member using the association for fraudulent purposes by false reports or otherwise shall be summarily expelled on a two-thirds vote at a special meeting called for the purpose."

The next important was that which called for the election of members by ballot.

Formerly the nomination of an applicant was all that was necessary for membership; however, the members saw the necessity of preventing the admission of persons of questionable business morals and adopted this by-law requiring each application for membership to be voted upon before such applicant could become a member.

These two by-laws show that the association is determined by every means in its power to prevent any wild-cat schemes in this district.

Mr. R. B. Nickerson, Manager of the Laurentian Mine, has been to the Mikado and made an examination of the surface workings and as much of the inclined shaft as he could. In his opinion the prospects were sufficiently good to warrant the pumping out of the mine, which work has been undertaken and is now in full swing, so that the end of the week should see it completed. Another examination will then be made and if satisfactory, work will be commenced at once, as we understand the necessary capital has been subscribed.

The report of a remarkable strike comes from Dryden, where an old prospector claims to have struck a four-foot vein heavily loaded with free gold. Several other claims have been staked on the same head and a good deal of work is going forward there at present.

Cobalt.—The big Temiskaming mill is practically completed and as soon as the power is ready it will start running. The rock-breaking end of the concentrator has been built next the head frame and is distant from the main part of the mill several hundred feet. The crushed ore will be transported to the concentrator by an aerial tramway, where it will be sized and then passed over the jigs. Some time ago a test was made on a carload of Temiskaming ore at the Trout Mills concentrator, and it was found that about 65 per cent. of the total silver contents could be extracted in the jigs. The management estimates that there is a year's supply of milling ore on the dumps and two years' supply in the mine above the 350-foot level. The shaft has now been sunk to a depth of 420 feet and a station is being cut at the 400-foot level. The vein dipped from the shaft to the east and a cross-cut will be run from the lower levels to cut it. Winzes have been sunk from the 300-foot level and the ore in the bottom is good. The annual meeting, which is to be held in Toronto shortly, will probably give rise to a good deal of discussion among the shareholders. Several large holders of stock in Buffalo have organized to send delegates to the meeting and have sent out circular letters to other shareholders asking them to organize in a similar manner and also send delegates. The object is to protect the interests of the shareholders and to obtain all the information possible about the affairs of the company. The low level that the stock has gone to lately has caused considerable uneasiness among its holders.

Several petitions have lately been circulated in Cobalt and the outlying districts with the object of trying to obtain a legal eight hour working day in the mines of Northern Ontario. It has been stated that few western miners would stay in this camp on account of the long hours worked. One or two of the mines work eight hour shifts, while several work nine

hours, but in the great majority of the mines a ten hour shift is worked. When these petitions have received a sufficient number of signatures they will be forwarded to the member for this district, who, it is expected, will bring the matter before the Legislature. For some time past there have been underground rumours of a strike among the miners next summer. This would be an unwise move on the part of the union, which is not in so good a shape as when the last strike was called. The Mine Managers' Association, which was responsible for the miners being defeated last time, is exceedingly well organized and can be depended on to put up a strong fight in the event of such a contingency.

Some time ago it was stated that the Buffalo had recommended work in an old drift that had been in the Keewatin when stopped. After a few rounds had been taken out the drift went through into the conglomerate again, and it was found that the Keewatin was simply an intrusion and that the valves reappeared in the vein in the conglomerate. Drifts have been run on the vein for over 200 feet in this new conglomerate area and the silver contents were found to be as high as ever.

During the month of January there was shipped from the Cobalt camp a total of 67 cars of ore, aggregating 2,054 tons. As compared with the same month the previous year, the shipments were about 400 tons less, but there are three more properties that are shipping concentrates, and this, though it cuts down the tonnage, raises the silver contents. One of the most interesting features of the shipments is the output from Gowganda, consisting of three cars, aggregating 92 tons. One of these cars, from the Reeves-Dobie, is stated to have been one of the richest ever shipped out of Northern Ontario. This district is beginning to make good and although it will never realize the extravagant promises that were made for it, a better attitude towards that country may be looked for. During the month the O'Brien shipped its first lot of bullion, amounting to 29,000 ounces.

The engineer sent up by the Dominion Government to look into the damage done by shooting out the falls in the Frederickhouse River, reports that navigation in the bodies of water affected is hopelessly ruined. Father Paradis, one of the pioneers in the country, cut through the falls in the river, and this caused the water in Frederickhouse and Night Hawk lakes to be lowered about eight feet. The engineer states that he does not consider the Dominion Government to be in a position to take any action in the matter.

As the result of a conference between the Mine Managers' Association of Cobalt and Mr. E. T. Corkill, provincial inspector of mines, it has been decided to petition the Dominion Government to order an inspection of all dynamite, fuse and caps used in the province. This action was determined by the alarming number of accidents that have been occurring in the mines. It was decided to petition the Dominion Government in preference to the Provincial as the former is in a much better position to carry out tests. A great many of the accidents from explosives can be traced to the use of gelignite. This blasting compound is entirely untrustworthy in cold weather as it is particularly sensitive when it is frozen. The advantage in using it lies in the fact that it is much more powerful than common dynamite and is comparatively free from noxious gases when exploded.

The Nipissing Company is again working its famous 49 vein that was at one time the wonder of the camp. Development on other portions of the property are also very satisfactory, especially at No. 64 vein, which is a continuation of one of the Hudson Bay's main producers. When this vein was first encountered it showed thirty inches of ore that would run 2,000 ounces. Although the vein as at present opened up does not show this width there is a large body of high grade ore that will aid materially in helping to swell the resources of the company. The Nipissing is in an enviable position as regards resources, and has an immense territory, a large portion of which is as yet practically unexplored.

The Bartlett mines will be completely reorganized and work resumed in a short time. The stockholders who actually paid cash for their stock will be recognized, but others will not. This property will at last have a chance to make good, although it is handicapped by an excessive capitalization. When work was stopped the main shaft was down about 115 feet. The vein left the shaft at about 40 feet, and when the cross-cut was run from the bottom of the shaft to cut it the values were found to be very low. However, there are other good showings to be opened up and the rest of the property is practically virgin ground. The Blackburn mine has shipped another carload of high grade ore aggregating twenty tons. Negotiations have just been concluded for one of the most important options ever given in the Gowganda district. An English syndicate has taken an option on the Morrison claims, which are owned by the Northern Mining Company. The option is for only a fifty per cent. interest and the price to be paid if the option is taken up is $200,000. The syndicate is to spend $100,000 in developing the property, which has one of the most sensational surface showings in the north country. The present owners do not receive anything unless the option goes through, as the $100,000 is to be spent entirely on the property.

In diamond drilling toward the Drummond boundary the Crown Reserve cut two new veins at a distance of 190 and 420 feet, respectively, from the No. 2 cross-cut. The core showed native silver and a large extent of mineralized area. The veins were cut about 150 feet below the surface.

The White Reserve Mine, in Maple Mountain, has cut veins Nos. 6 and 21 in a cross-cut at the 140 foot level. Another dividend of 300 per cent. has been declared by the T. & H. B., this making the second for the year. Up to date this company has paid a total of 15,700 per cent. on an issued capital of $7,761.

Porcupine.—Interest in this district received a great impetus when it was learned that the Timmins had taken up their option on the Hollinger-McMahon properties in Tisdale township. The first payment of $15,000 has been made and the total purchase price is $300,000. Already a plant has been ordered consisting of two 60 horse-power boilers, two hoists, a five-drill compressor, drills, etc. The main shaft is down forty-two feet and a drift is being run on the vein which shows free gold at that depth. When the machinery is installed the shaft will be sunk to a depth of 100 feet before any work is done. The fact that this option has been taken up will have a very beneficial effect on the district and many sales have been reported. As a general thing, however, the prices at which the claims are held are ridiculously high, but in the spring a more normal state of affairs may be expected and more properties will probably change hands. Additional discoveries of free gold are being reported constantly, but in the majority of cases these rumours may be heavily discounted. A good deal of trouble has been experienced by prospectors on account of thieves stealing their supplies, which is a very serious matter in a country such as that. In some cases camps were broken into and everything portable stolen. Some provincial constables have been sent up lately and matters have much improved. By an order-in-council the Provincial Government has withdrawn all lands under Night Hawk Lake, Frederickhouse Lake and all the lakes adjoining the townships of Whitney, Tisdale and Mountjoy. The Government has also provided for a right-of-way for a branch line from the T. & N. O. should the conditions in Porcupine warrant it, and by an order-in-council the surface rights over a right-of-way 99 feet wide have been reserved.

BRITISH COLUMBIA.

Rossland.—The situation here remains about the same as it was as the year was ushered in. The mines are working stead-

ly and shipping an average tonnage with the possible exception of the Velvet, which cannot ship at present owing to the snow having melted from the road.

The report of the Le Roi Mining Co. for the fiscal year ending Sept. 30th, 1909, has come to hand, and shows a small profit despite the adverse conditions under which the property was operated for a period of the time reviewed. The amount of ore shipped by the mine to Northport smelter during the part of the year that it was operated amounted to 26,935 tons, which carried an average of .642 ounces gold, .33 ounces silver, and .85 per cent. copper. The report shows that the cost of mining, including depreciation on its large plant and considerable development, was $9.21. Smelting and realization was $6.02 per ton. It may be pointed out here that this is $4 or $5 higher than the average cost of mining at the Le Roi when working full force, and was caused by the property only being worked a part of the year and then not shipping heavily. For instance, in 1907 the figures ran $4.04 and $5.98 respectively. For the year in question £20,712 7s 1d was written off for exploration and development; £10,378 8s 4d for depreciation on machinery, plant, etc., and £2,935 13s 4d for sundry items, making a total of £34,026 8s 9d. The amount carried forward to the credit of profit and loss is £79,331 6s 10d, so there is a surplus of assets over liabilities of £29,758 6s 3d, and this is exclusive of mine and smelter. The Le Roi Company is handling a difficult and perplexing condition of affairs in a commendable manner, and it is hoped that the results of the energetic campaign that is being waged will be such that the company will be placed in a much better position than it enjoys at present. During the first five weeks of the year the Le Roi has shipped nearly 2,000 tons of ore to Trail smelter, and diamond drill exploration on the lower levels has been in steady progress—lately with two machines, one having been laid off a while ago. Two feet of $85 ore has been opened up on the 600-foot level and a three-foot shoot on the 1200-foot level.

Work on the Mayflower, in the South belt, which is under lease, has disclosed some good shipping ore, and the lessees will make a small shipment to Trail smelter in the near future.

Boundary.—The ore shipments from the Boundary district are close to the 200,000-ton figure for the first five weeks of the year, the Granby, Mother Lode, Snowshoe, and Oro Denoro being the principal shippers.

At the Rawhide mine of the New Dominion Copper Co. good results are being obtained in the diamond drilling and preparations are now being made to begin shipping shortly. Buildings, crushers, conveyors etc., are being arranged so that the ore can be handled at least possible expense. It is proposed to do some diamond drilling on the Brooklyn mine of this company as soon as the work has been driven to the desired point on the Rawhide.

Permission has been granted to the liquidator of the Dominion Copper Co. to call a meeting of the creditors. The application of the agent of the New Dominion Copper Co. to have the liquidator discharged has been set aside. The application of the liquidator to be permitted to take action against the directors of the company in the Supreme Court of New York was held over. It is to be hoped that the affairs of the old company will in the end be equitably adjusted. It seems that the liquidator is doing all he can toward this end and just now is making good headway.

The B. C. Copper Co. is going to try and place a profit-sharing scheme before its employees, in an effort to do away with labour dissatisfaction. This plan is now being worked by several large corporations on this continent with success and it is thought that it would steady conditions locally to some extent. Stock in the company at a low enough price to warrant a good return on the investment may be offered, or else a sliding scale of wages will be adopted, which will work to a finer degree than the sliding scale now in force, which only covers "abnormally unfavourable," "normally favourable," and "abnormally favourable" metal mining and marketing conditions. The Conciliation Board is sitting in Greenwood this week to adjust the existing difference between the company and its men. The annual meeting of the company will be held in a few days at Charleston, W. Va., when it is expected that action on several important matters will be taken and a probable change made in the directorate.

The compressed air plant is working at the Greenwood-Phoenix Tram. Co. tunnel and 22 men are employed. Driving will be continued now at the rate of about 12 feet per day.

Nelson.—It is rumored that something is likely to be done to further develop the rich iron deposits controlled by the Canadian Pacific Railway east of Kitchener. Over $50,000 has already been expended on these deposits. Several Crow's Nest capitalists have had a steel plant in mind for this section of the country for a year or two, and it is highly probable that their plans will be realized at no late date.

One of the Spokane shareholders in the Sullivan Group Mining Co. is suing that company for the return of $500 that he paid for stock in 1906. He alleges that the company's financial statement was fraudulently prepared, and that instead of having a cash deposit of $9,000, an operating profit of $138,000, and a net gain of $102,000, that the company was bankrupt. The events of the last 18 months would appear to bear out this contention for the affairs of the company are in poor form. The mine is now being operated under lease and option to the Consolidated Co., and has shipped 435 tons of ore in the last two weeks.

At the convention of the Associated Boards of Southeastern British Columbia, recently held in Nelson, the following resolutions which affect the mining industry to a greater or less extent, were adopted: Government operation of telephones; that the Dominion of Canada purchase gold and silver for coinage from the Trail refinery on the basis that the United States purchases through its assay offices; that the Dominion of Canada coin silver dollars; for a uniform Canadian boiler inspection act; that the Department of Mines conduct experimental work toward determining the practicability of economical treatment of the zinc ore of this district; that the Provincial Government abolish the personal property tax.

Everyone who has ever had to handle some of the filthy one dollar bills that are circulating in this country is in favour of the coinage of silver dollars, and, of course, this would help the silver mines of the Dominion to some extent. Canada certainly should have a uniform boiler inspection act. The existing conditions are more or less of a farce, the thing having gone altogether too far in some of the Provinces. The regulations in British Columbia, and particularly in Alberta, not only work a hardship on the manufacturers but on the mine owners as well, and the general feeling in the matter among mining men of prominence here in the west is that the thing has got to be made uniform and rational.

Vancouver—In view of the bright outlook for the Coast mines this year an American syndicate has taken over the old Van Anda smelter and will fit it up to treat a tonnage of 150 tons per day. A new oil-burning process is planned.

It seems a foregone conclusion that the Ingenica and Manson-Slate Creek districts are not what is generally termed "a poor man's district." Several hundred samples taken by one prominent hydraulic miner in that district show the ground to carry $2.65 per yard and over, exclusive of values that might be contained in the black sand content.

It looks as though the coming spring and summer would see wonderful activity on Vancouver Island, the Queen Charlotte Islands, Portland Canal, Telkwa, Babine, and others of the new north-western districts.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—The Dominion Antimony Mines, West Gore, Hants County, are being worked for English interests. The old dump is being concentrated. Little more than pumping is being done, so far as the mine is concerned. Picked ore from this property contains $40 or $50 in gold to the ton.

Halifax, N. S., Feb. 18.—The announcement was made at Glace Bay to-day that D. H. McDougall, Superintendent of Mines of the Steel and Coal companies, has been appointed assistant general Manager from this date.

J. H. Plummer, President, and C. S. Cameron, Comptroller of the Steel and Coal Companies, left Sydney yesterday for Montreal, and will be absent about a week or ten days.

ONTARIO.

Port Arthur.—Silver ore is being bagged at the Porcupine mine. Twenty men are working and more are to be hired immediately.

Cobalt.—Assessment Commissioner Frank Kennedy estimates the present population of Cobalt at 5,500, and in a statement of the town's finances, estimates the town debt at $122,000; assessable property and income, $1,484,376. The estimated revenue last year was $58,887, expenditure, $59,662. The total assets are $1,554,000, while the taxes in arrears amount to $25,000.

Cobalt.—The Watts property on Cross Lake have just completed another shipment of ore. It consisted of 21.6 tons of concentrates and high-grade, slightly richer than the average run from the mill.

Cobalt.— February 22.—In spite of the inadequate power at the Savage mine, two new veins have been cut in the last month's work and progress has been made in the process of converting the property from a prospect into a mine.

Two days ago No. 5 vein was cross-cut 26 feet north of No. 4, and some time ago No. 4 vein was struck in the first cross-cut run from No. 3 vein. Both veins have been opened up since the beginning of the year. All three veins, Nos. 3, 4 and 5, run parallel. No. 4 is 44 feet distance from No. 3, and No. 5. is 26 feet north of No. 4. At the 85-foot level, No. 4 is 2½ inches wide and No. 5 is about an inch wide. Both veins carry about 1,200 ounces average, and there is a considerable amount of milling rock on either side of the vein. As these two veins appeared on the surface, as merely fissures with no values, the discovery of ore in them at depth is very satisfactory. Four more fissures, identical with No. 4 and No. 5, appear on the surface, and under the circumstances, it is extremely probable that these will also make ore at depth.

The sorting plant at the Savage is completed and only waiting for the power. It consists of a jaw crusher, an elevator, a sizing trommel and for the fines, a Wilfley table, for the next two sizes, hand sorting tables. It is estimated that it will treat 75 tons a day and the tails will only run about 15 ounces.

ALBERTA.

The annual meeting of the shareholders of the Western Coal and Coke Company, was held yesterday, when the following directors were re-appointed: E. B. Greenshileds, Senator Mackay, J. B. Ferguson, Charles Fergie, H. A. Lovett, J. McConnell, G. B. Woods, J. N. Lake and J. E. Woods. The managing director, Mr. Charles Fergie, reported that development work was making rapid progress, and that the mine would be in a position to produce 800 to 1,000 tons a day by the end of the year, also that the coal was of excellent quality and had recently been tested by the Canadian Pacific Railway Company on their engines with satisfactory results.

At the subsequent meeting of the directors, Mr. J. B. Ferguson who had held the office of president for the past two years, resigned the office owing to ill-health, and the fact that he would be somewhat out of touch with the head office, as he now resided at St. Catharines, Ont. Mr. Ferguson nominated M. E. B. Greenshields, who is largely interested in the company, as president. Mr. Greenshields was elected by unanimous vote, and Hon. Robert Mackay and J. B. Ferguson were elected vice-presidents. Mr. Chas. Fergie was re-appointed managing director.

BRITISH COLUMBIA.

Portland Canal.—Mr. Joseph Perrault, a veteran prospector, has bonded the O. H. fraction in Portland Canal district to a Victoria syndicate for $75,000. The property adjoins the group of the Portland Canal Mining Company. It is said to have several large ledges of silver-lead ore. The Victoria syndicate will start development work early next month.

Victoria.—Mackenzie and Mann have apparently worsted the C. P. R. in a move for the Dunsmuir coal mines. Before May 1st the mines in all probability will become the property of the Canadian financiers, who have developed such wide interests in this country in the past few years. A C. P. R. option has expired and now the other interests have but to make good to acquire the whole of the coal fields with the mines now working.

It is said that Mackenzie and Mann are backed up in this latest enterprize to which they have turned their attention by no less a financier than J. P. Morgan, and the alleged interests of J. J. Hill. To such an extent is Morgan allied with the proposition that it is said that the $11,000,000 which Mr. Dunsmuir is to receive is to be paid over in actual cash.

The acquisition of the mines is to be followed by further extensions. The output is to be increased very materially just as fast as the work can be done. There is also included in the scheme of development on this coast, the erection of steel works which will provide for a considerable output from the mines, and at the same time develop the resources of the province.

The expenditure is further developing the mines and accessory enterprizes will, according to the plans in view, represent an expenditure of an additional $5,000,000 or more. At the present time Mackenzie and Mann are developing from small beginnings, a smelter near Port Arthur, on Lake Superior, a smelter, which those qualified to understand, say will be one of the best of its kind in America within a short time. The intention of the firm is now to enter the field on the Pacific coast and build up a vast enterprize.

Some months ago, in a newspaper interview, D. D. Mann stated that if no such works were provided here before he and his partner became factors on the coast, they would erect one. Apparently the opportunity has presented itself to this firm sooner than they expected, and the work will begin almost at once.

It has long been known that the C. P. R. was willing to acquire Mr. Dunsmuir's coal mines. It is believed, in fact, that that company regarded them as destined eventually to come into their possession. Procrastination on the part of the directors, however, although at times the dealings went so far as obtaining options, resulted in the prize passing from their hands and the acquisition of it by rival financiers.

Phoenix, Feb. 8.—The Granby mines at Phoenix, shipped 112,458 tons of ore to the Granby smelter during the month of January, which is the largest output of the mines in any one single month. This tonnage forced the ore receipts at the

Granby smelter up to the high-water mark of 115,084 tons, of which amount 2,626 tons were from foreign properties.

During the month of January about 108,000 tons of ore were treated at the Granby reduction works, an average of about 3,500 tons per day. Only six furnaces were in operation during the greater part of the month.

The ore receipts at Granby smelter for January were as follows: Granby mines, Phoenix, 112,458 tons; Snowstorm, Coeur d'Alenes, 958 tons; Belcher, Republic, 1,220 tons; Duluth, Toroda, Republic, 10 tons; Copper King, Republic, 53 tons; Ben Hur, Republic, 112 tons; Lone Pine, Republic, 21 tons; South Republic, Republic, 21 tons; Arlington Slocan, 20 tons.

COMPANY NOTES.

PETERSON LAKE SILVER COBALT MINING CO., LIMITED.

Toronto, Feb. 15th, 1910.

To the Shareholders, Peterson Lake Silver Cobalt Mining Co., Limited:

Gentlemen:—Since the last report to shareholders, made on November 27th, 1909, the Board of Directors under authority given them by the special meeting of shareholders of October 6th, 1909, have pressed on to trial the several actions that were then pending against the Messrs. Steindler and Mr. Jacobs and against the Nova Scotia Mining Co. After the trial of the first action had proceeded for some time the company's claims against the Messrs. Steindler and Mr. Jacobs were settled by the payment over by these parties to the company of $50,000, together with $3,000 towards the company's costs and by the return of 160,000 shares of stock to the treasury. This settlement of the matter was made upon the very strong recommendation of the presiding judge, who, in fact, assisted in it to the extent of acting as arbitrator upon the question of the amount of stock to be returned. Your directors were also much influenced in making this settlement by the advice of counsel. While it may seem a very modest return to be made to the company for the large amount of the company's stock that was improperly issued out of the treasury, yet your directors felt that it was their duty to give great weight to the consideration that too exacting demands would mean prolonged litigation involving retarded development and the risk of all the chances attending a battle through the courts. The settlement arranged has been carried out and your directors feel confident that while some individual shareholders may be disappointed who bought shares in the company in the expectation of a rapid rise on the market as a result of the litigation, yet the great body of shareholders who bought their stock on their faith in the company's property and who have continued to hold it in the expectation that with honest and competent management the shares would become intrinsically of much increased value, will agree that the action of the Board was in the best interests of the company and a business-like arrangement of a situation that gave serious concern to the many experienced and conservative men interested in the company's welfare.

The action of your company against the Nova Scotia Silver Cobalt Mining Co. was tried on the 20th day of January, 1910, and argued on the 1st day of February, 1910, and is now standing for judgment. The Nova Scotia Co. during the progress of the trial conceded their liability to pay to this company a 25 per cent. gross royalty instead of 25 per cent. net as had prevailed under the old management. This basis will apply to former shipments as well as to the future.

The result of the litigation apart from the claims against the Nova Scotia Co. is that the company will have a sum in the neighbourhood of $58,000 in the treasury in cash and the return to the treasury of 160,000 shares of stock, making a total of shares in the treasury at the present date of 598,180 shares and 2,401,820 shares in the hands of the public. The treasury stock alone at the present market value would realize to the company $149,795, but the present management have not found it necessary so far nor is it their intention to encroach on this reserve.

Your president has, in view of the discovery of rich ore in the Little Nipissing lease (the vein of which has a strong indication of running into the Peterson Lake unleased lands), called for the sinking of a shaft on the island in the Peterson Lake Co. property midway between the shaft of the Susquehanna Mining Co. and that of the Union Pacific Mining Co., to a depth of 150 feet, and feels that in view of the latest developments that there is a strong possibility of finding the Little Nipissing ore body on sinking and drifting from this shaft and your directors now feel that it is time for the Peterson Lake Co. themselves to develop their own ground.

The Little Nipissing Mining Co. have uncovered a very rich vein, and on the first day of February last the Peterson Lake Co. shipped a car of ore consisting of 199 sacks of first grade and 509 sacks of second grade ore, which ore has been shipped to the O'Brien Smelter at Deloro, Ontario, for treatment. The Peterson Lake Co. are entitled to 25% of the gross proceeds from this car of ore and from all indications on this lease another car of ore will be ready within a very short time. A contract is at present in consideration for the shipment of a car of screenings the result of development on the Little Nipissing lease to a New York smelting firm, and this ore will be shipped in the name of the Peterson Lake Co. The Little Nipissing Co. have sunk their shaft to a depth of 165 feet and have made drifts covering a distance of 1,819 feet all at an expense of about $62,186, which ultimately must enure to the benefit of the Peterson Lake shareholders.

The Susquehanna Mining Co., who are operating and developing block A, B, C, and D, Lot 14, of their leased ground in Peterson Lake have sunk their main shaft 200 feet and have done drifting in all 490 feet and have spent in the neighbourhood of $37,058 up to this date, all of which must eventually enure to the benefit of the Peterson Lake shareholders.

The Kerry Mining Co. have done shaft sinking amounting to 393 feet and have done drifting work covering 1,187 feet and erected a plant, etc., all at an expense of over $74,688, which also must enure to the benefit of the Peterson Lake shareholders.

The Gould Consolidated Co. have done about 200 feet of shaft sinking and over 200 feet of drifting, but at present, on account of the lack of power, have stopped their work, which will no doubt be resumed with more vigor when power is installed.

The Union Pacific Mining Co. have developed their leased ground by a shaft 148 feet, which must also enure to the benefit of the Peterson Lake shareholders. This Company are also waiting for installation of power.

The St. Anthony Mining Co. have sunk a shaft 200 feet and done drifting work about 25 feet, all at an expense of $10,227, which must also enure to the benefit of the Peterson Lake shareholders. This company are also waiting for installation of power.

The Cobalt Leasors have done considerable amount of trenching and diamond drill work on their lease, all at a considerable expense, but have stopped work on account of lack of power.

In the Peterson Lake Co., as matters now stand, there are 2,401,820 shares issued out of a total capitalization of 3,000,000 shares. They are selling on the market at approximately 25c., giving a net market value of Peterson Lake property to-day of $600,455. This divided by the acreage (213 acres) gives a market value per acre of $2,819. The Nipissing Mining Co. have issued 1,200,000 shares which have a market value of over $10 per share. At $10 per share the value of the Nipissing property would be $12,000,000, and having an acreage of 846 acres would give a market value of $14,184 per acre. Since the Peterson Lake ground is almost entirely surrounded by Nipissing ground there is only one reason why this difference of $11,365 per acre should exist between the two companies. This difference is no doubt due to the undeveloped state of the Peterson Lake ground. If Peterson Lake ground were developed as fully as the Nipissing ground there is a strong possibility that the two properties should have an equal value per acre. The undeveloped state of the Peterson Lake ground to-day is due to lack of proper management in the past and there is every reason to believe that the progressive campaign of development mapped out by the present Directorate will expose ore bodies equal to those in the surrounding properties.

The Consulting Engineer of the Company is constantly supervising the work of the Lessees and the interests of the shareholders are being protected to the fullest extent. The Directors consider that the leasing system, in view of the result in other mining camps, is the best policy to pursue in the initial development of the Company's large holdings, because of the fact that a small acreage is leased to individual persons on terms which make it imperative that the ground should be thoroughly prospected and developed which the company could only do at a great deal of expense.

The result of the leasing system is that your Company derive a royalty from any result of ore found of 25% and at the end of the term of the lease will have the property in its developed state turned over to them and all ore then remaining will become absolutely the property of the shareholders of this Company.

The Company has in all 213 acres of mining property of which a considerable portion is still unleased. That veins already discovered upon leased property will extend to the unleased portion is a reasonable expectation. There are also at other points on the unleased lands indications of value that appear to justify development and which it is hoped will result in valuable discoveries. It is the intention of your Directors with the funds now available to actively prosecute the work of exploration and development. With a practically assured income from various leases with only a slight outlay on the part of the Company this policy should commend itself to the most conservative shareholder and be a source of satisfaction to many who have waited a long time to see their faith in this property justified. Further reports will be made to the shareholders from time to time and with the support of the shareholders and a very moderate degree of good fortune the Directors will be able in the near future to put the Company on a dividend paying basis,

The President, A. F. MacLaren, and Directors, thank the individual shareholders for their support in the past and trust that their recent and future activity in the proposition will warrant the same support hereafter.

R. F. SEGSWORTH,
Secretary-Treasurer.

TRETHEWEY SILVER-COBALT MINE, LIMITED.

Editor's Note.—The gross returns from ore for 1909 are reported at $314,940.28; gross value of ore at smelters and in transit, (Dec. 31st, 1909), $73,612.32; totalling, $388,552.60. Deducting from this amount the smelter charges, freight and cartage, and assaying and sampling charges—$40,688.46—the sum of $347,864.14 is left. Miscellaneous receipts bring this up to $350,257.39. Operating expenses amounted to $141,852.30; head office expenses $6,697.45, (a creditably small item); directors' fees, etc., $1,900—making a total of $150,449.75.

The net revenue for 1909, therefore, was $199,807.64. During the year one dividend of 10% and one of 15% were paid, in all $244,545. A balance of $91,302.93 remained at the credit of the Company on Dec. 31st, 1909.

DIRECTORS' REPORT.

Submitted to the Annual Meeting of Shareholders held in Toronto, on Wednesday the 23rd day of February, 1910.

The balance of the capital stock of the company previously unissued, amounting to 54,550 shares, was sold during the year at $1.50 per share, realizing $81,825.00, being a premium of $27,275.00 over par. This fund, after providing for the building of a concentrating mill now in course of construction, and other capital expenditures in connection therewith, will leave a surplus for the general purposes of the Company.

Production.

The following shipments have been made during the year:

8	cars	First-class Ore	to Copper Cliff,	weighing	453,211 lbs
2	"	" "	Deloro	"	120,689 "
2	"	" "	Thorold	"	130,078 "
25	"	Second-class Ore	to Carnegie Pa.	"	1,594,249 "
			Total weight		2,298,227 "

Gross value of ore of all grades shipped	$388,552.60
Freight and treatment charges	40,688.46
Net Revenue from sale of ore	$347,864.14

Improvements.

The physical condition of the property has been materially improved during the year. In the rock-house an additional jig was installed, also dewaterizers; set of rolls; concentrating table, etc. An independent condenser and cooling tower have been added as auxiliaries to the power plant, whereby an increased efficiency has been obtained. All buildings have been painted and kept in good state of repair, so that the appearance of the plant on the surface has been greatly improved. A substantial machine and carpenter's shop has been built and equipped with machinery suitable for wood and iron work, operated by electricity obtained from a generator in the power house, which also supplies power to the pumping station at Sasaginaga Lake and for lighting the property on the surface and underground. The plant in the machine shop includes: Lathe of large size; press drill; bolt cutting and threading machine; double rip saw and crosscut saw; buzz planer and band saw. This machinery has been a very important factor in the construction of the concentrating plant, and provides an almost indispensable permanent equipment for the future economical operation of the mine and concentrator. An additional pump has been installed which will provide ample water for the concentrator and all other requirements. Precaution has been taken in the installation of the pipe line to provide a good flow system so that in case of fire the whole pressure from the pumps will be available, together with the flow from the tanks at the top of the mill. A transformer building is in course of construction in which the high voltage current delivered by the power companies to the camp will be stepped down to 550 volts before entering the mill.

Concentrator.

A modern mill of 100 tons capacity has been built, and a large portion of the machinery has been installed. This plant will be operated by electrical power, and will be completed as soon as the power companies are in a position to deliver power

for its operation, which will probably be during the month of April. The policy of your Directors in delaying construction of a concentrator until electrical power became available, will result in a very large saving in the cost of the Plant and in its operation. Inclined tramways have been erected to connect No. 2 and No. 4 shafts with the mill, so that ore hoisted at these points will go direct to the concentrator for treatment. It is expected that the quantity and quality of ore mined will be sufficient to run the mill at its full capacity without drawing on the ore now lying on the dumps, which will be held in reserve to supply the mill in the event of strikes or other unforeseen circumstances interfering with the operation of the mine. These reserves are sufficient to keep the concentrating plant in full operation for eighteen months, at an estimated profit of not less than $1,000 per day.

Development.

No. 1 Shaft. A drift has been run during the year on the 100-foot level a distance of 340 feet, connecting with the workings on the same level at No. 2 Shaft. Connection between the two shafts has also been made on the 50-foot level, both of which drifts are in good condition for hauling a large tonnage of ore to either shaft.

No. 2 and No. 3 Shafts. A considerable amount of cross-cutting and drifting has been done from these points, exploring a large territory with very gratifying results. Work is now being carried on at three levels.

The total amount of underground work to date is as follows:

Drifts and Cross-cuts	6,558 feet
Shafts	596 feet
Raises and Winzes	845 feet

No. 4 Shaft. A double compartment shaft has been sunk to meet an upraise from a depth corresponding to the second level of the Temiskaming and Hudson's Bay Mine near the north end of the property. It is now being timbered and fitted with a cage road. During the development work which has been carried on at this end of the property, four veins have been met with, three of which are of high-grade; the total drifting thereon amounts to about 750 feet, with about 60 feet of upraising. Assays taken from ore won while drifting showed values of from three to four thousand ounces per ton. It is interesting to note that the workings on the Temiskaming & Hudson's Bay Mine near the north line of this property are now down to 250 feet, and reported to be in good ore.

The development work conducted during the past year has demonstrated the fact that the veins on the property occur, for the most part, in the form of a net-work of small fissures in an immense zone of fractured rock, which has been more or less enriched in and near the cleavages by the deposition of native silver. The extent of this zone can only be determined as development work proceeds, but the work so far conducted at both ends of the property would lead to the expectation that the whole belt of conglomerate extending from the south line to the north line will be found to maintain the same characteristics. Should this prove to be the case an enormous tonnage of ore suitable for profitable concentration will be won from the property during the next few years. With the facilities now being installed a large and steady revenue may reasonably be expected from the occurrence of bonanza veins likely to be encountered as development work proceeds.

ALEX. M. HAY,
President.

Toronto, February 10th, 1910.

A Dividend of 5 per cent., with an extra dividend of 5 per cent., has been declared on Kerr Lake. Books close March 1st, and open on March 15th.

NOVA SCOTIA STEEL & COAL COMPANY.

A meeting of the Board of Directors of the Nova Scotia Steel and Coal Company was held at the Windsor Hotel, Montreal, President Robert E. Harris, presiding. There were present Hon. Jas. D. McGregor, Vice-President, Hon. Robert Jaffray and Messrs. Robert Reford, J. W. Allison, Jas. McGregor, W. D. Ross, R. E. Chambers and Thos. Cantley, Second Vice-President and General Manager. The General Manager's report reviewing the business of the past year was submitted and showed that the volume of business was the largest in the company's history. The President submitted the statement of assets and liabilities and profit and loss account, and the directors report to the shareholders showing the profits for the year 1909 to be $907,949, as compared with $734,701.53 for the previous year, an increase of $173,247.47. Another gratifying feature of the report was the fact that the sum of $184,453 for premium and commission on the redemption of the old and for the new issues of bonds has been paid out of the profits of the year. This is regarded as a very satisfactory showing. Other features that call for attention are that cash in the bank is now $207,029 and bills payable and cash advances are reduced to $607,458, compared with $999,109 last year. Thus there is almost half a million better showing than a year ago. This is made up of cash in the bank and reduction in bills payable. The balance carried forward to the credit of profit and loss account is $336,807.38

The sum of $362,653.27 has been expended during the year on capital account in the development of the submarine iron ore areas at Wabana and for improvements, plants, etc., elsewhere. During the early part of 1909 business conditions had not recovered from the depression, but in the latter part of the year the earnings of this company showed that conditions have attained their normal. The reorganization of the finances of the company authorized by the shareholders has been carried out. A new issue of $6,000,000 5 per cent. first mortgage bonds and an issue of $1,000,000 6 per cent. debenture stock were made; $3,500,000 of the bonds and $1,000,000 6 per cent. debenture stock were sold in Canada, and the two former issues of 6 per cent. bonds were paid off and cancelled. The balance of $2,500,000 of the bonds remains in the treasury. No portion of the premium on the retirement of the old bonds nor of the commission on the new issue has been changed to property account. The regular dividend of 2 per cent. quarterly has been paid on the preferred shares. The directors have declared further dividends of 1 per cent. on the ordinary shares and 2 per cent. on the preferred shares, payable on April 15 to shareholders of record on March 31, 1910.

It is understood that three of the present Nova Scotia Steel and Coal directors will retire in a few weeks, to be replaced by Mr. Rodolphe Forget and two of his associates, who have been buying large blocks of stock lately. This means that Mr. Forget has won the representation on the board which he has been aiming for by the recent heavy purchases of stock made by himself and a group of his supporters,

---

McKINLEY-DARRAGH REPORT.

At the annual meeting of the McKinley-Darragh Mining Company held in Toronto, the financial statement as well as the statement of the physical condition of the mine, was one of the best presented to the shareholders.

The most interesting item of the report is the statement of the manager P. A. Robbins when speaking of the total output of the mine for the year. The total output of silver for the year was 1,297,530 ounces, which is equal to the entire production of 1906, 1907, and 1908, combined. It may be noted here that the total tonnage for 1908 was ahead of the tonnage for 1909, but during 1909 nothing but high grade and mixed concentrates have left the camp.

On the first of last year the company had only a small mill treating about twenty tons per day. This was increased to an eighty ton mill and later in the year additions were made to bring this up to 120 tons per day.

The annual report shows gross receipts from sales of ore and other sources in 1909 of $639,442.03, including balance from the previous year of $46,419.95. From this was paid out for operating expenses and improvements $294,262.35, dividends aggregating $224,493.03, leaving balance on hand at the end of the year of $120,686.85. The balance sheet shows $120,758.62 cash on hand, ore at smelters $106,712.48 and ore at the mine ready for shipment of $10,558.80, with current liabilities of only $16,910.70.

At the present time mining is carried on only on a small scale at the Savage mine which is owned by the company. This claim is situated near the Gillies Limit on Cart Lake. The company is waiting for the power from the Montreal River to start up this mine.

Developments for the past year on this property have shown that considerable high grade ore has been blocked out. The annual report shows 755,000 ounces, which is a considerable improvement over the previous year's estimates. At the mine a large ore house has been erected containing crushers, jigs, tables, etc., and the company hopes to treat in the neighbourhood of twenty tons of its lower grade ore per day, recovering eighty-five per cent. by this method.

Underground work at the mine consists of a seventy-five foot shaft, known as No. 3 which is connected up on that level with its main shaft. Two veins underground show good native silver values, and very little exploration work has been accomplished. With the power from the Montreal River operating their workings, the management will immediately start a couple of drills on development work to look for new ore bodies, which are believed to exist in the neighbourhood of its workings.

At the McKinley-Darragh mine, at the south end of Cobalt Lake the company is working on four levels of the main shaft. Owing to the inadequate means of handling its ore until its new addition to its mill is in operation, the company has been confining its drills to prospecting work for the past few months. No stoping is being done, the ore for the mill being taken out in drifting on its ore bodies. It is estimated that underground blocked out, at the mine there is ore containing 4,973,000 ounces of silver. This like the Savage shows a big gain over the estimates given for the previous year.

At the present time Manager Robbins employs a force of over 100 men and six drills are operating underground.

SCOTIA REGULAR DIVIDEND.

The Nova Scotia Steel & Coal directors have declared the regular quarterly dividend on the common stock of 1 per cent., and 2 per cent. on the preferred stock, payable April 15 to shareholders of record March 1, 1910.

PORTLAND CANAL MINING COMPANY, LIMITED.

Extracts from proceedings of the Second Annual General Meeting of the Shareholders.

DIRECTORS' REPORT.

Your directors have to report that during the current year they entered into negotiations with a firm of underwriters, and the sum of $100,000 was secured to the company in return for a block of the company's shares.

The above capital was required for, and is being used in the installation of a concentrator, aerial tramway, water power plant and for general purposes of the company.

The concentrator and power plant are well under way and will be completed at an early date if the snowfall is not excessive. Had normal climatic conditions prevailed during the past season, the plant would probably have now been complete, with the exception of a part of the concentrating machinery, which has not yet arrived from the manufacturers.

The concentrator has been termed a 50 ton unit, but as our ore will only require coarse concentration we expect to be able to mill about 100 tons every 24 hours. The Tramway, which is of the Bleichert type, is now about completed, and will be 8,500 feet in length and bring ore from the mine at an altitude of 2,100 feet to the concentrator in Beaver River Valley. It can be equipped to transport 200 tons every 24 hours and will be utilized for conveying all supplies from the mill to the mine.

Our water power is a splendid asset, and will be ample for all requirements when we multiply the capacity of our concentrator, and this we expect to do at no distant date. The water is brought from the head of a waterfall in a 2 ft. by 4 ft. flume along the side of a canyon, over a trestle 70 feet high, across Glacier Creek and along the mountain side to the mill, a total distance of 1,400 feet, the effective head being 100 feet. Owing to the fact that there was a large tonnage of ore in the mine available for stoping, and our camp facilities were being taxed to their utmost capacity to provide accommodation for tramway employees and others, it was considered inadvisable to carry on an energetic campaign in the mine during the summer.

No. 1 tunnel was advanced 110 feet to a total length of 180 feet, 35 feet of cross-cutting was also done in this tunnel, which, with the exception of a few feet, where purely local distorted conditions prevailed, may be said to be all in good ore. No. 2 tunnel is 124 feet in length, and, with the exception of a few feet of what might be termed low grade concentrating ore, is also all in good ore. No. 3 tunnel was advanced 65 feet to a total distance of 300 feet, and a raise and cross-cut connecting Nos. 3 and 2 tunnels was completed. At 280 feet from the portal of No. 3 tunnel a splendid body of ore was encountered, the development of which will be vigorously prosecuted this winter. This ore body is the downward continuation of that disclosed in Nos. 1 and 2 tunnels and carries the same or better values, native silver and argentite being fully as conspicuous as in Nos. 1 and 2 tunnels.

Your directors have no hesitation in assuring the shareholders that they consider the property one of the most promising in British Columbia, and there is absolutely no doubt but that substantial dividends should be paid when the complete plant has been in operation for a reasonable period.

The directors all retire from office but are eligible for re-election.

Respectfully submitted on behalf of the Board of Directors.

C. H. DICKIE,
Chairman and Managing Director.

PRESIDENT'S ADDRESS.

Gentlemen,—Before moving the adoption of the balance sheet a copy of which was mailed to each shareholder, I know it is expected that I will make a few remarks respecting our promising mining property. A brief synopsis of what we have accomplished in the north this season appears in the Directors' Report which accompanies the balance sheet.

Under the head of Mines and Concessions in the Balance Sheet the item of salaries, when compared to that of wages might occasion criticism, it should have been spread over the total expenditure, and comprised the sum voted at the last annual meeting for directors' remuneration and the salaries of the Secretary and Managing Director for the last thirteen months.

The item of travelling expenses was incurred entirely by the Managing Director and comprises the expenses incurred on seven trips to Stewart, which means over ten thousand miles,

some of these trips being very expensive owing to the fact that it was thought advisable to charter boats from Prince Rupert and Port Simpson in order to avoid delay, and as an effort was being made to keep in touch with both ends of our enterprise, the expense is justified.

The item also provides for the expense of two trips to Spokane, one to the Couer de Alene mining region in Idaho, and numerous trips to Vancouver and Seattle, all in the interests of the company.

After energetic but disappointing efforts extending over several months, your directors on March 13th last entered into an agreement with a firm of underwriters, the result of which gave us the sum of $50,000, and an optional agreement was entered into for a further sum of $50,000, which became practically available on August 16th last, and then and only then we knew we were able to carry out our contemplated installations. We have sold the underwriters 1,333,333 shares for $100,000, or at the rate of 7½ cents per share, and the concluding payment from the underwriters is the supplementary item mentioned in the Auditor's Report.

At the time we concluded this agreement with the underwriters our shares were being hawked about for six and seven cents per share, and there was only a small demand for them at that figure, and had we been unsuccessful in obtaining this capital, would have inevitably gone to a still lower figure.

Since our financial troubles have been dispelled your shares have been steadily enhancing in value, and in view of our splendid assets, should continue to do so.

The underwriters had a long period of anxiety, and I believe regretted their bargain until the latter part of August, when owing to the fact that our property was attracting considerable attention largely because of our great faith in the property as displayed in the installation of our tramway and concentrator, share values began to have an upward tendency, and were in demand, then the underwriters, whose financial bravery meant success to our company, when comparative failure would have been our portion, for one season at least, commenced to see the dawn of success to which they are well entitled. As a direct result of our success in obtaining capital our property is now attracting more attention than any other on the coast, and justly so I believe.

You can readily understand that I would have been highly pleased to have been able to inform you at this meeting that our concentrating plant was complete, but despite strenuous efforts on our part this is not yet the case, but you will kindly bear in mind that we have been doing pioneer work in that country, and under exasperating physical and climatic conditions, but we now have matters well in hand. This matter has occasioned your directors more worry than it need cause you, for the value of your holdings has not been adversely affected, nor should they be in the future. All of the machinery for our equipment has been paid for and we have a substantial amount in the bank to our credit. During the past season a number of prominent mining men have visited our property, and I have yet to hear the first pessimistic report concerning it. Among those who have visited us have been Mr. Henry Martin, Mr. Vaughan-Rhys, Mr. Knobel (McKenzie and Mann's representative), Mr. Barclay-Bonthorne, Mr. J. L. Parker and Mr. Carmichael a copy of whose Government Report you have doubtless all read, and we have been assured that had we struck the ore in our lower tunnel before that gentleman had made his inspection, his report, admirable and optimistic as it is, would have been made stronger in favour of our property.

Your directors hope that at no distant date your concentrator will materially assist in the payment of dividends, for all ores on Glacier Creek can be advantageously concentrated, and admirably situated as we are, and with splendid water power, we should build up an extensive and profitable concentrating business.

I am proud to say that our company has a reputation for fair dealing, which I hope may be maintained, and which is a valuable and effective asset in securing customs ore either for milling or smelting.

The plans and model we have here will give you an idea of our workings, and you must continue to bear in mind that the section we are at present exploiting, only comprises one-ninth of the length of the main ledge which runs through our property, besides we have the Gypsy ledge, which in itself may develop into a mine, and owing to the very favourable geological formation, and to the contiguity of adjoining prospects, it is highly probable that we may uncover other valuable outcrops when we have time to thoroughly prospect our holdings. When we struck the ledge in No. 3 tunnel the mineralization consisted solely of iron pyrites and quartz, no galena being then in evidence and I anxiously awaited the result of the first assay, as so much depended upon whether the iron sulphides continued to carry good values in depth.

The assay went in gold $10.00, and silver $40.00 per ton. In grinding up the sample, minute pellets of native silver were found disseminated all through the sample, and this thoroughly convinced me that the iron and the precious metals were deposited contemporaneously by ascending mineralizing solutions, and this formed a strong argument indeed for the probability of encountering Bonanzas or extremely rich chambers of ore in places in the vein where conditions have been unusually favourable for such occurrence.

After getting several feet into the ledge, galena and argentite came in, and the ore, a sample of which assayed in gold $34.00 and silver $54.00, to the ton, was just as strong, or stronger than in our upper workings, and the ledge had been proved 13 feet thick with the hanging wall not yet in sight, when I left camp.

To estimate the probable available tonnage of ore we now have, let us draw a line from the upper open cut to the face of our workings in No. 3 tunnel, then another at right angles out to the surface cropping, now this triangular piece of ground contains approximately 70,000 superficial feet of vein area, which is quite reasonable to suppose contains ore of the same quality as that exposed in our workings. It is a safe estimate that the ore will average 8 feet in thickness, and that 12 cubic feet will weigh a ton, this gives us 46,666 tons of available ore, if we have not overestimated it.

Taking into account the considerable tonnage of very high grade ore we have found in each tunnel, we may estimate the value of our ore-body to average $15.00 per ton, on the basis as paid by smelters. The ore can be mined, milled, transported and smelted at a cost to our company, not to exceed $5.00 per ton. As we have an ideal concentrating ore, we hope that 10% will cover values lost during concentration.

Accepting the above estimates as being conservative, and they are meant to be so, the net profit which would accrue to our company, from the ore contained in this triangular piece of property, is in round numbers $400,000.

Suppose we convert this triangle into a rectangle and consider that the same conditions prevail as in the ground we are already familiar with, and there is no apparent reason why they should not be, we simply double our tonnage and profits, and gentlemen, when we have exploited this ground, we will have made only a very modest beginning towards garnering the wealth which is undoubtedly contained in our property, for I ask you again to bear in mind that the piece of ground upon which we have been basing our calculations, is only an infinitesimal part of our equally promising holdings.

Our Consulting Engineer, Mr. Elmendorf, made no exaggerated statement in his last report, when he said, "I have no fear

as to the amount of ore this vein will produce with proper development.''

At our last annual meeting I did not place our property on as high a plane as I am doing to-day, for at that time although I was satisfied in my own mind that such would be the case, I was not absolutely certain that the high values would be found in depth, and might in a measure be due to surface enrichment or concentration. Since we have encountered the high-grade ore in No. 3 tunnel, at such depth from the surface, I am fully convinced that we have a magnificent mining property, and I have no hesitation in saying to you that I believe our shares are worth double the price they are now being quoted at, and I think they will go many times that figure, for we have surmounted our most serious obstacle and are now practically on the plateau of prosperity.

The thanks of our company are due the Provincial Government for the most generous and considerate treatment accorded the district.

On behalf of our Board, I beg to sincerely thank the shareholders who conferred a high compliment on the Directorate, and brought prosperity to the company by complying with our request and placing their shares in escrow, at the most critical period in the history of the company's affairs, time has as yet, I feel assured, only partly demonstrated the wisdom of your generous confidence in your Board of Directors. Now gentlemen, thanking you for your patience, I beg to move that the Report and balance sheet is hereby received and adopted. After the motion is seconded, and before putting it to the meeting, I will be pleased to make any explanations or answer any questions to the best of my ability to do so.

STATISTICS AND RETURNS

STATISTICS AND RETURNS.

Following are the figures of German consumption of foreign copper for the year 1909:.

Imports of copper	157,795 tons
Exports of copper	8,053 "
Consumption of copper	149,742 tons

as compared with consumption during the year 1908 of 151,715 tons.

Of the above quantity 143,717 tons were imported from the United States. Reported by L. Vogelstein & Co., New York.

TRANSVAAL GOLD OUTPUT.

The London secretary of the Transvaal Chamber of Mines is advised by cable from Johannesburg that the total gold out-

put of the mines of the Transvaal for January, 1910, amounted to 579,743 oz. for the Witwatersrand district, and 21,625 oz. for the outside districts, in all, 601,368 oz. fine gold, total value, £2,554,451, being a decrease of 3,619 oz. in weight and £15,371 in value, as compared with December, 1909. The production in December was 604,987 oz, of fine gold, with a total value of £2,569,822. The total production in January, 1909, was 615,113 oz. of fine gold, total value £2,612,836.

B. C. ORE SHIPMENTS.

Nelson, Feb. 5.—The feature of the week in mining is the steadily increasing number of silver-lead shippers to Trail, the total for the Consolidated Company's plant for this week being the largest on record. The general mine output was well up to the present high weekly average. Appended are details:

NISSEN STAMPS

The Modern independent Circular Mortar Gravity Stamp.

DESCRIPTION

THE MORTAR. The Nissen Mortar is of circular form and contains but one stamp; each mortar has an independent feeder which feeds the ore automatically upon the die. A cam raises the stamp and then allows it to fall by gravity on the die, which crushes the ore by impact. The ore is fed so evenly and regularly to the die that a maximum crushing efficiency is secured.

THE FEEDER. Each Nissen Mortar is fitted with an improved Challenge Feeder. The feeder is the most important element of the mill since its action governs the efficiency and capacity of the mill. The parts are reduced to a minimum, are durable, simple and interchangeable. Absolute adjustment and control of the feed is secured.

SCREENS. The Screen of the Nissen Mill is circular in form, conforming to the contour of the mortar and stamp and extends more than half way around the mortar. As the splash from the die is radial every part of the screen surface presents a free opening for the egress of pulp immediately it is crushed to the right degree of fineness.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

GEOLOGICAL SURVEY

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

MARITIME PROVINCES

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

QUEBEC

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

ONTARIO

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

THE NORTH WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.

THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

CANADA

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet.
1025. Waverley Sheet.
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

ONTARIO

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

YUKON

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

REPORTS

1072. Summary Report of the operations of the Geological Survey for year 1908.
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.
1075. Gowganda Mining Division, 1908. W. H. Collins.
1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10 00 to the Department of Mi· es. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

FACULTY OF APPLIED SCIENCE AND ENGINEERING

Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry
6. Chemical Engineering.
7. Electrical Engineering.

For Calendar and other information apply to the Secretary

A. T. LAING.

An Accurate Ore Test on any metal in 10 minutes For Five Cents.

Thats what the Mining Man or Prospector can have, provided he has a Way's Pocket Smelter Outfit. Anybody can make his own tests right in his office or in the field on **any ore.** Think of what this means to a prospector "miles away from nowhere" or to the mining man who must make dozens of tests a day.

Write for folder giving full information about **Way's Process** and describing both field and laboratory outfits.

Mining Law of Canada

BY

ALFRED B. MORINE, K. C.
(Of the Bar of Ontario, Nova Scotia and Newfoundland)

The following table of contents conveys a fair idea of the scope of the work :

CHAPTER I
Mining Terms and Phrases.

CHAPTER II
PART 1—Laws in force.
PART 2—Dominion Legislation.
PART 3—Provincial Legislation.
(*a*) Manitoba, Alberta, Quebec, Nova Scotia and New Brunswick.
(*b*) Ontario.
(*c*) British Columbia.

CHAPTER III
PART 1—Crown Lands.
(*b*) Indian Lands.
(*c*) Railway Belt.
PART 2—Railways and Highways.

CHAPTER IV
Capacity to Work, Sell, Lease or License.
PART 1—Extent of Rights.
PART 2—Capacity to Lease.
PART 3—Partnerships and Companies.

CHAPTER V.
CONTRACTS
PART 1—Making.
(*a*) Statute of Frauds.
(*b*) Part Performance.
PART 2—Enforcing.
(*a*) Statute of Limitations.
(*b*) Specific Performance.
PART 3—Terminating.
(*a*) Rescission.

CHAPTER VI.
Mining Licenses and Mining Leases.
PART 1—(*a*) Bare Licenses.
(*b*) Profits à Prendre.
(*c*) Leases.
PART 2—(*a*) Parcels.
(*b*) Term.
(*c*) Covenants.
(*d*) Forfeiture and Re-entry.
(*e*) Reservations and Exceptions.

CHAPTER VII
PART 1—Easements.
PART 2—Fixtures.

CHAPTER VIII
PART 1—Employer's Liability.

CHAPTER IX.
Wrongful Abstraction.
Criminal Offences.

CHAPTER X
PART 1—Assessment.
PART 2—Registration.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905. Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

CHAS. SIMISTER, General Superintendent.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temp erature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

This Catalogue

Now Ready for Mailing

Though Easter comes very early this year, it was decided not to publish this Catalogue until we could illustrate the

Authentic Spring Styles.

We might have guessed at styles, made our Catalogue look just as attractive, and brought it out a month earlier; but we would not have been keeping faith with the thousands of customers who rely on us for authentic information. You will find the latest and best ideas in every garment pictured here, besides hundreds of novelties which our buyers, just returned from Europe, brought with them. A comparison of our prices with those found in any other catalogue will prove to you that it costs no more to be "in style," nor to supply yourself with this season's novelties, which are not obtainable at the shop near by. Your address on a post card will bring you this Catalogue free of charge.

INDUCTION MOTORS
IN
CRUSHING & CEMENT PLANTS

Polyphase Induction Motors have many advantages in the operation of rock crushers, ball mills, tube mills, rotary kilns, hoists, conveyors, pumps and other machinery. In addition to flexibility and economy, demonstrated in many othe lines of service, electric drive eliminates long lines of counter-shafting, a specially desirable feature wh re gritty dust makes the maintenance of both belts and bearings very expensive.

In the dusty atmosphere of a cement mill the simple squirrel cage rotor of an induction motor is much less liable to give trouble than the wound armature of a direct current machine. The illustration shows one of our 100 H.P. type "AN" induction motors belted to a tube mill at the Belleville Plant of the Canada Cement Company Limited. The equipment of that plant includes over 1,000 H.P. of our motors.

Amatite ROOFING

WILL END YOUR ROOFING TROUBLES

IF you will write to-day for a free sample of "Amatite" the end of your roofing troubles is in sight. After you have submitted it to every test that you can think of, you will be prepared to order it not only for your *new* buildings, but for your *old* roofs as well. You will find that it is cheaper to cover them with Amatite than to continue painting and repairing them.

We make a strong point of our "Free Sample" offer because the smallest sample of Amatite speaks for itself. It is more convincing than yards of talk.

There are all kinds of ready roofings on the market—so-called "rubber roofings," so-called "guarantee roofings," so-called "sand surface roofings.

The "rubber" roofings are no more made of rubber than a cow is made of saw-dust. The "guarantees" that are promiscuously handed out with many brands are hedged around with so many provisos that it will take three lawyers to dissect them and find out what they are all about. The "sand surface" has little or no protective value.

The point to remember is that all of these roofings have to be *painted* every year or two to keep them tight. In other words, it is the *paint* that protects, and not the roofing.

You can lay Amatite on a roof and then forget all about your roofing troubles. *No painting, no coating, no worry.* The man who puts Amatite on his buildings is insured against leaks and trouble for many years.

FREE SAMPLE

Send for sample and booklet to-day. The sample tells its own story: the booklet is written for practical men.

Address our nearest office.

THE

MINING MANUAL

1910

BY WALTER R. SKINNER.

The Standard Reference Work on Mines.

Price 17/- net Post Free (Abroad).

1,600 pages. In demy 8vo, handsomely bound in RED cloth.

A record of information concerning

MINING COMPANIES

(Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, Exploration and Mining Investment Concerns, &c.)

Arranged in three sections—

Australasian, African, Miscellaneous,

Preceded by Tables of Crushings and followed by lists of Mining

DIRECTORS, SECRETARIES, MINING and CONSULTING ENGINEERS and MINE MANAGERS.

Their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected, and a

DICTIONARY OF MINING AND OTHER TERMS.

THE MINING MANUAL for 1910 contains particulars of over 3,600 Companies arranged in three sections, 430 Companies being AUSTRALASIAN (including Western Australia, Queensland, Broken Hill, Deep Leads, New Zealand and Tasmania); 1,030 AFRICAN (including Transvaal, Rhodesia ,West Africa, Cape Colony, Natal, Egypt); and 2,140 MISCELLANEOUS (including Siberia, Mexico, India, British Columbia, America, &c., and the Coal, Iron, Tin and other Mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; plant erected or in course of erection; present working results; ore reverses; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts. Highest and lowest prices of the shares for the last four years, also latest price. The three sections extend over 1,100 pages,

Crushing tables and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

The Lists of Directors (8,000), Secretaries (1,900, Mining and Consulting Engineers and Mine Managers (1,400) include their addresses and descriptions and names of the Companies with which they are connected.

A complete Alphabetical Index, containing the names of 5,300 Companies and including many useful items of reference, occupies 42 pages.

Full particulars of all Re-constructions, Re-organisations and Amalgamations durlng 1909 are given in a simple and concise form.

THE INSTITUTE MEETING.

Now that the smoke of battle has cleared away, it is apparent that the Twelfth Annual Meeting of the Canadian Mining Institute was eminently profitable. It is evident, also, that the Institute bulks larger in the public eye than ever before. This is true, not merely because of its large membership, but more particularly for the reason that it is developing and following a more or less definite policy, and is not too timid to give formal expression to its opinions. Whilst entire unanimity of thought cannot be expected of any aggregation of human beings, yet the members of the Institute are generally of one mind on matters affecting the good name of the profession or the public status of the industry.

This is illustrated by the fact that the resolution correcting certain errors in Mr. Sifton's now historic address was not rescinded, despite the warm and, perhaps, impolitic efforts of the Secretary of the Commission on Conservation. The obvious purpose of the Institute was not to censure Mr. Sifton, but to draw attention to the unintentional inaccuracy of his statements. As a matter of fact, no society is in a better position to appreciate and assist Mr. Sifton in his magnificent task. Mr. Sifton is no super-sensitive lily. He is embarking upon a work that will bring him buffets and abuse—also it will bring him name and fame. He may count upon the whole-hearted support of the Canadian Mining Institute. That support would be meaningless if it consisted merely in blind approval.

The address of the retiring president, Dr. W. G. Miller, was comprehensive, lucid, and inspiring. His general review of railway development in relation to new mining regions was full of meat. Dr. Miller during his term of office has exercised an exceedingly potent influence on the Institute. It is comforting to know that his successor, Dr. F. D. Adams, is in every respect fitted to fill the exacting requirements of the presidency.

Especially notable amongst the papers read was that of Mr. P. McN. Bennie, on "Recent Developments in Electro-Siderurgy." The pleasant facility with which Mr. Bennie categorically answered the numerous questions put forward by his audience was, to say the least, unusual. Edifying, also, was the entire absence of the first person singular.

The audience, owing largely to the lateness of the session, did not appear to be adequately impressed with the importance of Dr. Stansfield's announcement concerning the direct production of steel from iron ores in the electric furnace. Dr. Stansfield's paper described the work of Mr. J. W. Evans, of Belleville, Ont. Illness

prevented Mr. Evans from being present. Dr. Stansfield is himself an authority on electrometallurgy. Hence the fact that Mr. Evans' results appeal to him is encouraging. We proffer our sincere congratulations to Mr. Evans.

All of the papers read by the visitors from the United States are eminently worthy of mention. Space will not permit this. But we cannot refrain from dwelling upon the addresses of Professor R. H. Richards and Dr. James Douglas. Professor Richards held his audience for a whole morning session. He gave us a glimpse of the means and methods that he has employed in searching out the whole philosophy of ore-dressing. Dr. Douglas spoke of his own early and unsuccessful attempts to mine copper in Quebec. To both of these gentlemen, as indeed to all the other visitors, the Institute should be specially grateful.

. . . . . .

The business sessions were heated. The proposed by-laws were murdered—and without anesthetics. It is a matter of regret that the discussion became vitriolic. This is totally unnecessary. However, it is not likely that any further attempt will be made to limit the membership of the Institute. The consensus of opinion appeared to be that, within decent limits, the doors should be wide open.

The proposed Nominating Committee also fell by the wayside. Here again the discussion was one-sided and quite insufficient. We must confess to a good deal of sympathy for those gentlemen who spent time and thought upon the proposed amendments. The reception offered them was scarcely courteous.

. . . . . .

The smoker, under the capable guidance of Mr. G. G. S. Lindsey, assisted by Mr. W. E. H. Carter, was a howling success. The dinner, likewise, was a well-managed and pleasant event.

. . . . . .

Glancing back over the three days, we see little to criticise and much to praise. We still believe, however, that discussions should be organized carefully before the reading of each paper, and that, except in extraordinary circumstances, papers should be presented in synoptical form. Sooner or later, of course, the Institute will be forced to resolve itself into sections so as to permit of the simultaneous reading of papers on diverse subjects.

. . . . . .

To the president, to the committees, and especially to Secretary Lamb and Treasurer Lecky, we proffer our felicitations upon having arranged and carried out so smoothly the best series of meetings of the Canadian Mining Institute on record.

THE EIGHT-HOUR DAY.

The Government of Nova Scotia has given much evidence of an enlightened desire to encourage trade and industry. Some time ago it framed enactments for the furthering of gold mining by means of specific cash subsidies. Latterly, under the guidance of Dr. B. E. Fernow, an inventory has been made of the province's timber resources, with a view to conservation and reforestation.

One of the most significant acts of the Government, however, was the appointment of a commission to report upon labour conditions and upon the practicability of an eight-hour day. The commission's report is reproduced in part on another page. The section referring to coal mining, and this more directly concerns us, while not remarkably explicit, is sufficiently definitive to provide much food for thought.

While the commission recommends reduction in the hours of employment in certain classes, it pronounces strongly against a general and compulsory eight-hour law. This, the report declares, "would be at present a fatal blow to the industrial prospects of Nova Scotia. . . . So far as coal mining is concerned, the commission would gladly report in favour of the shorter day if the facts permitted them to do so. But the existing market for Nova Scotia coal presents features of a grave character. The coal industry is fundamental to the welfare of the province, and before enacting legislation that would undoubtedly add to the cost of operating the mines, or seriously reduce wages, further consideration should be given to the features referred to."

We have no reason to think that the commission was in the least degree partizan. The members were independent citizens, chosen because of their fitness. Hence the report cannot be regarded lightly. Thus, also, it is gratifying to place on record the implied fact that, in comparison with clerks, shop-keepers, factory-hands and others, the coal miner of Nova Scotia secures better treatment from his employer. This is something to be taken to heart by our legislators. The eight-hour agitation will crop up constantly. Eventually it will become an accomplished fact. But it is the duty of our governments to see that the currents of our commercial life are not too rudely disturbed by premature concessions to agitators.

PROSPECTING IN ONTARIO.

The bona-fide and efficient prospector has always our admiration and support. Unfortunately, in the rush to stake something, many hundreds of inexperienced men have been sent north. Either through ignorance or through laziness, these men waste the season by loitering around established camps, or by following the beaten trail and the easy water route.

Mr. W. M. Goodwin's article, "Notes on Prospecting in Ontario," sets forth these and other truths, and, further, supplies timely hints to the novice.

EDITORIAL NOTES.

The Canadian Northern Pacific Railway Company, the name chosen for the British Columbia section of Mackenzie & Mann's system, is authorized by its charter to purchase and operate coal mines in the province.

The troops have been withdrawn from Glace Bay and Dominion. The expense of maintaining the contingent since the strike began amounts to about $75,000. This will be shouldered by the two towns mentioned and by the municipality of Cape Breton County.

On February 24th the Privy Council reserved judgment in the case of the Florence Mining Company vs. the Cobalt Lake Mining Company.

According to the Hon. Mr. Fielding, the Dominion Government has no present intention of renewing the bounties on iron and steel.

Proceedings of the Twelfth Annual Meeting of the Canadian Mining Institute, Toronto, March 2nd, 3rd and 4th, 1910.

DR. W. G. MILLER.

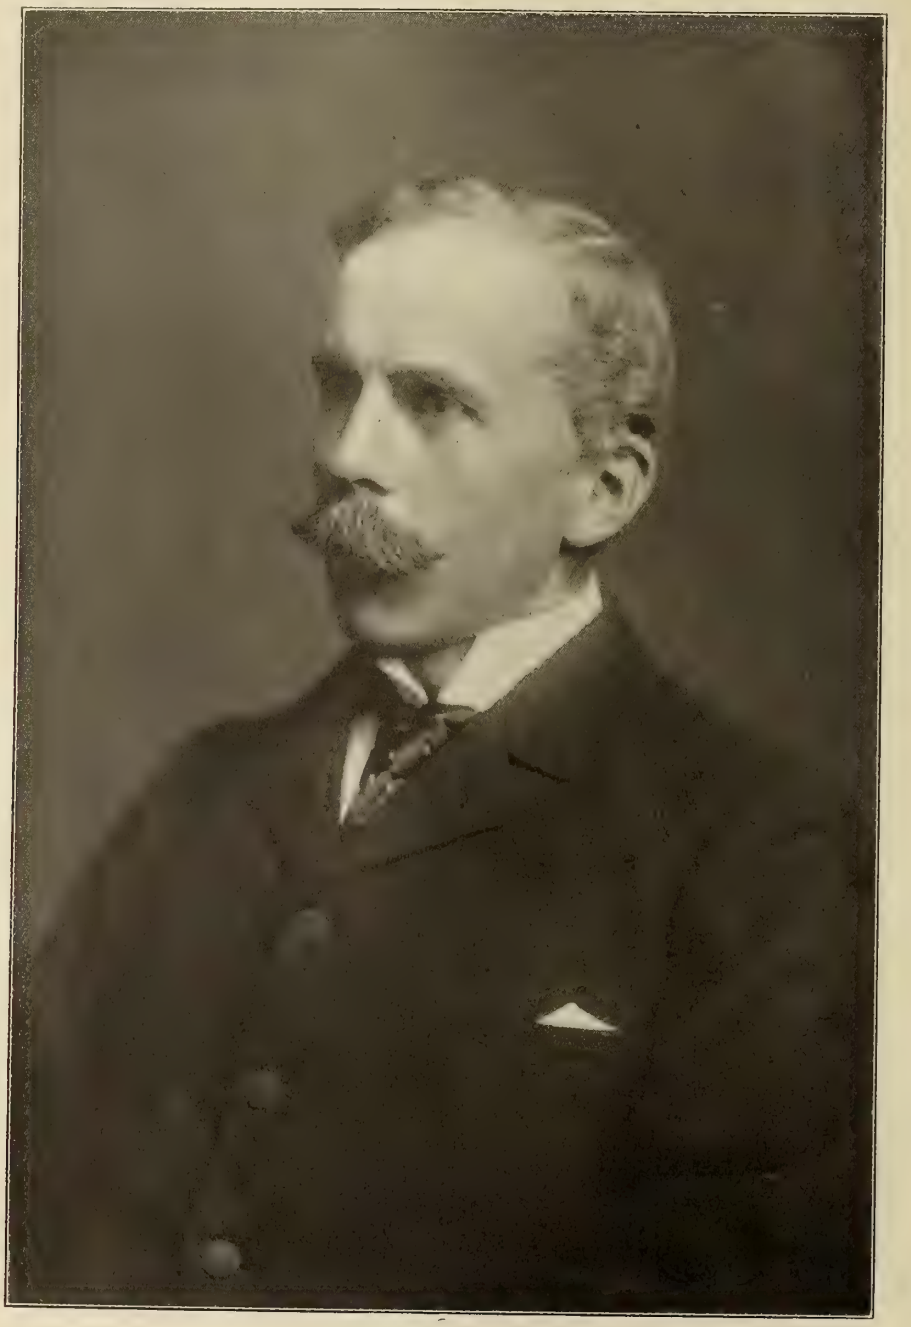
The twelfth annual general meeting of the Institute was held at the King Edward Hotel, Toronto, on Wednesday, Thursday, and Friday, March 2nd, 3rd, and 4th, 1910.

Wednesday Morning Session.

The proceedings were opened at 10.30 a.m. The president, Dr. W. G. Miller, introduced Alderman McGuire, chairman of the Reception Committee of the City of Toronto, who, on the unavoidable absence of His Honor Mayor Geary, extended a civic welcome to the delegates. Alderman McGuire's speech was brief and felicitous.

The presidential address, the text of which appears elsewhere in this issue, was then read.

The following resolution was then read by Mr. R. Brigstocke, and seconded by Mr. J. E. Hardman:—



"Resolved, That the Canadian Mining Institute regrets that the chairman of the Conservation Committee should have publicly made statements reflecting on the mining and metallurgical practice of Canadian

companies, without having been fully informed as to the actual facts and conditions."

The reference here was to the speech of the Hon. Mr. Clifford Sifton, which appeared in the Toronto Globe of January 22nd, and has already been commented upon in these columns.

In the discussion that followed, Mr. W. J. Dick, mining engineer to the Conservation Commission, explained that he had been engaged to look into these matters, not, however, until a date later than that of the speech. While he found that Mr. Sifton had been wrongly informed in the matter of Canadian smelters, he also found that the fatality rate at Cobalt was, according to the figures reported by the Bureau of Mines, 27.7 per thousand.

Then, at a later session, it was fully explained that the returns for men employed applied only to the producing silver mines. The fatalities cover a wide region and all the non-producing mines and prospects. For instance, two men were killed at Rib Lake pyrite mine. One was killed at a gold prospect, and so on. It is impossible to secure complete returns of men employed in these numerous non-producers and prospects, as there are daily changes and constant fluctuations. Hence it is totally unfair to charge up the total fatalities to the producing mines, especially as conditions at these latter are incomparably better than they are in the scattered prospects.

DR. F. D. ADAMS.

The resolution was carried.

The president now called upon Mr. J. McLeish, Statistician of the Mines Branch, Ottawa, to present the statistics of the mineral production of the Dominion for the year 1909. These will be found in full on another page. It is pleasant to record that Mr. McLeish was able to report a total output valued at more than $90,000,000. This is a substantial increase over 1908.

Mr. Theo. C. Denis, Superintendent of Mines, Quebec, followed with a statement of the mineral production of Quebec during 1909. Whilst a slight falling off occurred, yet Mr. Denis spoke most cheerfully of the future. One of the main causes, he stated, of the lower figure was the fact that extensive preparations were under way for increased production of asbestos. He felt confident that a much higher figure would be reached during the current year.

The secretary then presented statements from Nova Scotia, Alberta and British Columbia, all of which exceeded previous outputs.

In the absence of Mr. T. W. Gibson, Dr. Miller referred briefly to the record output of Ontario. The session then adjourned.

Wednesday Afternoon Session.

In opening the afternoon programme, the president drew attention to a fine collection of specimens from Porcupine, secured and displayed by Mr. H. P. Davis, who, incidentally, spent about 48 hours in more or less continuous dog-sled travel in getting them hurriedly together.

The secretary read Mr. Kendall's paper on "Mining Engineers and Mining Institutes." This paper has already appeared in our columns.

Both the secretary, who favoured restricted and classified membership, and the president, who openly advocated the inclusion of all reputable persons interested directly or indirectly in mining, gave expression to their views.

A paper by Director R. W. Brock followed. It was entitled "The Necessity of Distinguishing between Prospecting, Developing, and Mining."

Mr. J. B. Tyrrell, after speaking appreciatingly of Mr. Brock's paper, suggested the possibility of forcing the promoter to expend, in actual mining, at least 75 per cent. of all moneys received.

A paper by Mr. R. W. Seelye on the Helen iron mine, and one by Mr. Einar Lindeman on "The Iron Ores of Vancouver and Texada Islands," evoked most interesting discussions.

An excellent paper "Mining Literature," written by Mr. Allan Greenwell, Editor of the Colliery Guardian, London, was read by Mr. Frederick Hobart. This concluded the session.

Wednesday Evening Session.

Mr. P. McN. Bennie's paper, "Recent Development in Electro-Sederurgy." was listened to with not a moment's loss of interest. From first to last Mr. Bennie held his audience. In his introductory remarks, he explained that the laboratory work was at an end, and that commercial work was being undertaken. "It used to be said that the electric furnace had a future. It has something more than that. It has a past. We have taken off the cloak of experimentation, and we think that we now wear the royal purple of facts accomplished."

Full discussion followed both Mr. Bennie's paper and that of Dr. Stansfield on "Steel from the Electric Furnace." Dr. Stansfield described the production of tool steel direct from iron ore, as accomplished by Mr. J. W. Evans, of Belleville, Ont.

Thursday Morning Session.

At this session Dr. A. E. Barlow presented a general outline of his investigations into the origin of asbestos, and emphasized the vital bearing of such researches upon the economic development of the industry.

Professor Dresser followed with a dissertation on "The Distribution of Chromite and Asbestos Deposits of the Eastern Townships." There now ensued a lively debate in which Dr. Walker, Dr. Coleman, Prof. Baker, Dr. Adams and Dr. Irving took part.

"Criteria of Downward Sulphide Enrichments," a paper read by Dr. Ransome, of the U. S. Geological Survey, was now brought on.

Thursday Afternoon Session.

The afternoon session was taken up partly with routine business. When this had been disposed of, Mr. James Douglas was called up to give some reminiscences of copper mining in Quebec.

It is possible here to reproduce Dr. Douglas' entertaining and informing address. It must suffice to say that Dr. Douglas spake not unhopefully of the possibilities of the industry. Mr. Hardman, Dr. Wilson, and Mr. Dresser spoke on the same topic.

Friday Morning Session.

After Professor Haultain had read his paper on "A Wet Sample Cutter," Professor R. H. Richards delivered his address, illustrated profusely with lantern slides on "Some Directions in Which Improvements in Concentration May be Looked For." The presentation of Professor Richards' paper occupied the whole of the morning session. It is to be regretted that no time remained for discussion.

Friday Afternoon Session.

The visitors, officers and reception committee of the Institute were tendered a luncheon at the Legislative Buildings by the Hon. Mr. Cochrane, Minister of Mines.

Several members took the opportunity of expressing their sincere gratitude to Prof. Richards for his kindness in attending the meeting.

The Chairman then called up Mr. B. B. Lawrence to read his paper "Remarks Upon Two Well-Known Mines," to which Dr. Ledoux added some apposite comment.

Mr. R. W. Thompson's "The Portland Canal Region," and Dr. Ries' "The Clays of Nova Scotia," were the last papers read. Many other meritorious contributions had, through lack of time, to be omitted.

The scrutineers reported a vote of only 175 ballots—a contrast to former elections.

The election results were as follows:—

President—Dr. Frank D. Adams, of Montreal.

Vice-Presidents—Mr. A. B. Cole, Charles Fergie, J. B. Tyrrell, John A. Dresser, G. G. S. Lindsey, O. E. S. Whiteside, S. C. Blaylock, R. A. Bryce, R. T. Hopper and J. J. Penhale.

The session then adjourned.

The dinner was notable for the succinctness of the speeches. Among the guests were Mr. F. Congdon, M. P., Hon. Frank Cochrane, Mr. Ralph Smith, M. P., Mr. B. B. Lawrence, Prof. Richards, Dr. A. R. Ledoux, Dr. James Douglas, Dr. Irving, and Dr. Ransome.

An heroic rescue-party, equipped with Draeger and Shamrock helmets, saved a valuable official life. The premature explosion of a flash-light completely prostrated the person in question. His intrepid rescuers, whilst they applied some unorthodox methods of resuscitation, nevertheless succeeded in carrying the victim beyond the danger zone. It must be added that the victim was guilty of more than passive resistance. Hence the test was unusually severe.

The dinner was a fitting climax to three days of hard work. Mentally, if not physically, the delegates are lions refreshed.

PRESIDENTIAL ADDRESS OF DR. W. G. MILLER.

Gentlemen,—It gives me pleasure to welcome you to this the Twelfth Annual Meeting of the Canadian Mining Institute. On two former occasions, 1904 and 1907, we residents of Ontario had the privilege of meeting our fellow-members from other provinces in annual gatherings of the Institute in this our capital city. Since the earlier of these meetings Toronto has become one of the important mining centres of the continent.

While the Institute has a history of only twelve years, a period that has witnessed great progress in our industry in this country, its lineage can be traced some years further back through its immediate predecessor, the Federated Institute, and those provincial mining societies by the coalescing of which the Federated Institute was formed.

In my presidential address last year I gave a brief account of some of the work that the Institute has accomplished. This year it will be appropriate to refer briefly to the progress of the mineral industry during the past year, and to recent developments in Canada that materially affect the industry, together with certain objects that we should strive for in the future.

Progress in 1909.

The year has been a period of steady and substantial industrial growth and activity, although no developments of a sensational character have been witnessed. Almost every year sees the exploitation of new mining camps in Canada. Those to which most attention was directed during the last year were the alliterative twins —Porcupine and Portland Canal—the one on the Pacific coast and the other in the great central region. Perhaps the most striking feature of the past year has been the tendency on the part of large industrial concerns to consolidate their interests, which, provided the industries are not unduly handicapped by over-capitalization, should make for increased efficiency and economy in management and operation. This would especially apply in the case of the amalgamation of the coal and steel interests in Nova Scotia, which industries are largely dependent on one another. In Quebec the amalgamation of the asbestos mines has at least served to stimulate mining activity throughout the Eastern Townships. In Alberta, as a result of railway construction, great activity has been displayed in connection with the acquisition and development of coal areas. In British Columbia good general progress has been made. The Ontario mineral output was the largest on record.

Notwithstanding the lower prices of metals during 1908, the value of the mineral production for 1909 should show a gain of a few million dollars. For this gain, I believe, Ontario is chiefly responsible, although British Columbia is credited with an increased production of about a million dollars, and possibly the increased output of coal in Alberta will, to some extent, offset the decrease in Nova Scotia due to the protracted strike there.

Canada has become less and less dependent on foreign smelters and refiners. The Granby copper smelter in British Columbia is now the largest in the British Empire. Important work is being done in the refinery at Trail, while the plants erected during the last few years in Ontario—at Copper Cliff, Deloro and Thorold —have greatly advanced metallurgical work in this province.

The Dominion Mint at Ottawa is gradually increasing its usefulness. Heretofore it has been turning out copper and silver coins and British sovereigns. Now it is to mint Canadian gold as well. It is to be hoped that ere long Canada will have a pure nickel coin, since this metal has been proved by several countries in Europe to be well adapted for use in coinage. Surely the country that supplies most of the metal to commerce can afford to make use of it in coinage!

Of the four great industries in Canada, agriculture, mining, forestry and fisheries, that deal with natural resources, mining stands second only to agriculture in value of annual production. The value of the output of our minerals is greater than that of forestry and fisheries combined.

Railways.

It is said that about 65 per cent of the freight carried by the railways of the United States consists of minerals or of mineral products. This is absolute evidence that the mineral industry is very important from the railway point of view and vice versa. Hence it is encouraging to the industry in Canada to find such extensive railway construction being carried on. It is rumoured that the three greatest railways of the country will expend sixty million dollars or more in the building of new lines or in double tracking during the present year.

The building of these new lines is making a vast territory accessible to the prospector and miner. For instance, the National Transcontinental, in its course through the northern parts of the provinces of Ontario and Quebec, is doubling the accessible territory in both provinces. The Grand Trunk Pacific has about the same effect on northern British Columbia. Other lines are opening up, or will open up within a few years, vast areas in British Columbia and the other provinces.

The Dominion Government, it appears, has definitely decided to have a railway built to Nelson Harbour on Hudson Bay. The primary object in building this road is the shipment of grain, but even if the road never carries grain it is well worthy of construction. When one looks at the enormous coast line of Hudson Bay with the tributary rivers and considers the promising character of the rocks from the mineral point of view that are accessible to the coast, he must feel that there is likelihood of a very large mining industry being established by the construction of this railway. When the road is built one will be able to reach Port Nelson in a day or so from Winnipeg and there will be steamers running from this port to various points on the bay. This will give a comparatively long season for prospecting and exploring. Fisheries in these northern waters are also promising.

Still another railroad that in all probability will be constructed will run from Edmonton to Fort McMurray on the Mackenzie River waters. This will make the vast northern interior of Canada easily accessible. The great territory along the Mackenzie and tributaries in the vicinity of the Great Slave and Great Bear Lakes is known to possess promising mineral deposits, but, under present conditions, it is almost impossible to explore this territory satisfactorily.

From the brief consideration of the railroad building now in progress I think that we may feel confident that there will be an immense extension of our mineral industry within comparatively few years, the readily accessible areas being more than doubled.

Water Powers.

In many parts of Canada, and especially in the great central region, the presence of water powers has an important bearing on the mineral industry. This is shown by the use that has already been made of these powers in the greatest metallic areas that have as yet been developed, the Boundary district of British Columbia and the Sudbury and Cobalt districts of Ontario. In British Columbia the plant at Bonnington Falls supplies power to the mines at Rossland, Phoenix and Greenwood and to the smelters at Trail, Grand Forks, Greenwood and Boundary Falls. In Ontario the Canadian Copper Company has developed a water power which supplies with electric energy its large mines at Creighton and Crean Hill and the plant at Copper Cliff. Other mining companies in the Sudbury district Victoria mines, North Nickel range, and Moose Mountain are using or are preparing to use electric power generated by water falls.

Power is now being delivered at Cobalt from the Montreal River and in a short time the camp will have an abundant supply from this river and from the Matabitchuan. The benefits that are being conferred on these great metal camps by water powers illustrate the value of this source of energy to our industry. Without the results that have been accomplished by our fellow engineers, electrical and mechanical, during recent years, this employment of power would not have been possible. Twenty-five years ago our industry in many parts of the country could not have made the advance it has during recent years simply because electrical and mechanical engineers could not have supplied the power.

But when one thinks of what electricity has accomplished in other branches of the mineral industry during comparatively recent years, the consideration of water power for merely mechanical purposes seems prosaic. The inventions of Hall, Acheson, Willson and others in the production of metals and artificial minerals have made this age famous. Fifty years ago aluminium was little more than a scientific curiosity. It sold for two dollars an ounce. During the last year it has sold as low as fifteen cents a pound, and it is now one of the common metals of commerce and the arts. The production of carborundum and other artificial abrasives has done much to assist the manufacturers of machinery. Artificial graphite has become an important article of commerce. Artificial rubies are produced on a commercial scale. The manufacture of various alloys, that are now considered necessary in metallurgical work, is due to the advances in electrical knowledge in recent years. Calcium carbide, a product of the electrical furnace, is used as a source of light. Electricity is employed also in the refining of several metals and in the concentration of certain ores. But the most recent commercial achievement of electro-chemical engineers, the fixation of the nitrogen of the air, is the one that appeals most strongly to the imagination and may have vast, and at present unseen, beneficent results to our race. Certain compounds of nitrogen are essential as plant food. A few plants possess the power of abstracting free nitrogen from the air but the majority are dependent on extraneous nitrogenous compounds for their food supply. The store of mineral nitrates, which have long been in demand as fertilizers, is limited Recently the electric current has come to the rescue of agriculture and nitrogen is taken from the air and made into various compounds. Fifteen million dollars are already invested in the works in little Norway, where water powers are as abundant as they are in our own country.

While what I have said may be commonplace, still it shows the important influence that water powers have on our industry, both as a source of energy for purely mechanical purposes and in the refining of metals and the manufacture of mineral products. Canada is well situated to take advantage of the great development along modern lines, and it is encouraging to see the keen spirit evinced in this country in connection with the proper utilization of our water powers.

Forestry.

While water powers have a very important bearing on our industry, forestry is scarcely of less importance. Mining men are sometimes accused of taking little interest in the preservation and the proper utilization of the forest. The accusation is seen to fail when it is tried simply by the test of self interest. Since little mining can be carried on if forest products at reasonable cost are not available, mining men generally are interested in seeing that forests are protected. The present general movement in Canada for the protection of forests will receive the support of those associated with the mineral industry.

Mining Legislation.

Our secretary is to present a paper at this meeting dealing with mining laws and regulations. The paper will deal with the regulations of various countries for the sale and development of government lands. Ideal regulations will probably never be framed by any state, but a little discussion now and then does no harm. In all mining legislation two classes have to be considered, namely, the poor man or prospector, and the capitalist. If only the development of an industry in a country is considered, without the encouragement of individuals, the mining laws of Mexico, for example, are almost ideal. Briefly, individuals or companies in Mexico can acquire areas from the government, and so long as they keep up the annual acreage tax they control the lands. Of course, this acreage tax, under conditions obtaining in Canada, would often work a hardship on the poor man, and would make it difficult for anyone but a wealthy individual or company to hold land. The tendency is, when laws are made with the object of preserving both the rights of the prospector and the rights of the capitalist, for confusion to arise. The weaknesses in the mining laws of the various provinces of Canada are due to this. If only one class of persons had to be considered, the laws could be made much simpler. For instance, in some of the provinces of Canada, and in some of the states of the Union, working conditions are imposed upon the holders of mineral lands instead of an annual tax as in Mexico. It is considered to be easier for the man without capital to do a certain amount of work yearly than to pay an annual tax. Working conditions are also thought to tend to the more rapid development of an industry, but it is the writer's belief that working conditions have never been very successful in any state or province in North America. In fact, the insistance on work frequently leads to fraud.

The mining laws of British Columbia and Ontario have, owing to the development of the metallic industry during recent years, attracted more attention than those of the other provinces. It has been found that, in both provinces, one of the great weaknesses is blanketing. This is due largely to permission to stake by proxy. A man is not only permitted to stake two, three

or more claims on his own license, but, by getting licenses in the names of his sisters, aunts and other individuals, he may stake ad infinitum. One would think that if a man succeeded in staking, say, three good claims in a year, he should be satisfied. Some people, however, seem to think that a prospector is capable of staking many more good claims in one season, hence he has been given great latitude. Moreover, staking by proxy often reacts against the interests of legitimate prospectors. So many claims are offered for sale that prices are lowered and there is difficulty in separating the wheat from the chaff. British Columbia has an acreage tax which is good so far as it goes, and Ontario imposes a nominal tax on claims in unorganized territory; but the results achieved by this acreage tax in these two provinces are not nearly so important as that achieved by the larger one of Mexico. An acreage tax is the best preventive of blanketing and tying up of mineral lands.

Another point that is often discussed is the question as to whether governments should dispose of lands in fee simple or on lease. In Mexico and Nova Scotia, for instance, the leasing system is practically universal, and it does not seem to have had any bad effects on the industry. Large foreign companies are constantly starting undertakings in Mexico. In some of the provinces of Canada, however, great objection has been raised to leases. It has been claimed that it is often impossible to raise money on property that is not held in fee simple.

The Quebec law was changed about a year ago, and its enactments came into full force at the beginning of this year. These Quebec regulations seem to me to be well adapted to the conditions existing in that province. Of course, the regulations may not be ideal, but, if one or two slight changes are made, they would be about as good as can be expected. The price per acre, running from $10 to $20, depending on distance from railway, is higher than that charged in any other country. In fact, it seems to me to be too high, for the reason that the government will receive less revenue than it would if the price were lower, and to some extent it will have a tendency to discourage poor men. Then, since it is not the intention, as I understand it, of the Quebec authorities to inspect "discoveries," it seems to me that "discovery" should be left out of the requirements in making application for mineral lands. This requirement will serve no useful purpose, and may lead to trouble in certain cases.

As to the change in the Quebec law, I may say, and I feel that I am expressing the opinion of all the mining men who know of him or of his work, that Mr. Denis' recent appointment as Superintendent of Mines for Quebec has given great satisfaction. The government is to be congratulated upon its choice.

Dominion Legislation.

During the last year the Dominion Government has done much to encourage the industry. The appointment of the Select Standing Committee on Mines and Minerals was a move in the right direction. Hereafter the mineral industry will no doubt receive still greater recognition. As a result of their last session's labours the committee recommended that the government enact a code of mining regulations applicable to Dominion lands. The committee was strongly of the opinion that the present method of dealing with these lands by orders-in-council should be done away with. It is to be hoped that this recommendation of the committee will be acted on in the near future. All mining men will agree that a code of mining laws for the Dominion lands is urgently needed. The committee further recommended that the management of the Dominion mining lands should be transferred from the Department of the Interior to the Department of Mines.

During the past year the Dominion Government has appointed a National Conservation Commission. This commission should have a wide field of usefulness. Unfortunately, when new subjects come up, or old subjects under new names, such as that of conservation, faddists sometimes become active, and it takes time to get on a solid foundation. This has been to some extent the case with forestry and with our own industry. This Institute, and organizations of like character in other countries, have, it seems to me, been dealing effectively with conservation problems in the past, and, in so far as the mineral industry is concerned, the Institute will continue to be the organization in this country that is the most competent to give advice on such problems. The membership of the Institute embraces many men to whom the prevention of accidents, the refining of ores so as to prevent waste, and all the other problems connected with the industry, have been subjects of life-long study. There are some subjects with which governments can give assistance, and their assistance is always welcomed. But the mineral industry is one that does not flourish under paternalism, and advice such as has sometimes been offered in this country is not welcomed.

"How small a part of all that we endure
Is that which governments can cause or cure."

The prevention of mine accidents is a subject that has received careful attention in Canada. With regard to the inspection of the metal mines of Ontario, with which I happen to be familiar, I may say that I do not know of any metal-mining state in the Union where the inspection has been more systematic. Accidents will always be more numerous where there are many small mines or prospects than where the same number of men are employed in a few large mines. Inspection, including analyses and other tests of explosives, is a subject with which mine managers cannot be expected to deal. It offers a field of work for the government.

Changes are needed in connection with sanitary regulations for new mining camps. Many mining men feel that these new camps should not at first be organized on municipal lines, but that they should be governed by commission. Sanitary precautions could be taken from the beginning, and money raised by taxation could be expended with better results than it usually is by municipal officers in the hurly-burly period of a camp's existence.

As regards the prevention of waste in the handling and refining of ores, I think it can be said without fear of contradiction that Canadian metallurgists are fully alive to the subject. I do not think that a government can lead the way for private metallurgists.

The Dominion Government has apparently decided to appoint a commission to deal with technical education. This subject all mining men will admit has a very important bearing on their industry. The government is to be congratulated on its decision. It has been suggested for some years that technical education, being so closely connected with trade and commerce, should be dealt with by the Dominion Government, although education is, by the British North America Act, left to the various provinces. It is to be hoped that the broader view will prevail, and that the Dominion Government will see its way to assist very materially in the work of technical education.

There has been a great change in the views regarding education in Canada during the last twenty years or so. Most of us will remember that in our college days the type of education prescribed was that which had proved acceptable in the past, especially in Great Britain. This educational system was transplanted bodily to Canada, and was supposed to be adapted to the needs of a country entirely different from Britain. Fortunately, during the last two decades scientific and technical education has received much more attention, and it is now considered by many that a man with technical knowledge can be of as much service to his country as can one who has pursued merely one of the older courses of learning. Former ages have excelled the present in art and literature; but the present stands pre-eminent in the utilization of the forces of nature for the comfort and happiness of mankind.

Mining Taxation.

I have referred under mining laws to one kind of mining taxation, namely, the acreage tax. Most mining men will agree that this form of taxation has beneficial results on the industry, in that it tends to keep titles clear and to prevent the tying up of lands by speculators. It can, I think, be said to be a unique tax, since I never heard of another that was welcomed by those who had to pay it!

While those engaged in the mineral industry are desirous of bearing their fair share of the expenses of government, they frequently feel that they are unjustly discriminated against. If a mine or metallurgical works has a large equipment, or if the profits are even moderately large, the cupidity of those not connected with the industry is aroused, and there is a tendency to levy disproportionate taxes on the mine or works.

There are, broadly, two methods of taxing output, viz., on the gross or on the net profits. A tax on the gross is rarely fair. No consideration is given to costs of production. A tax on profits is much more equitable.

But the point in connection with mine taxation that needs most consideration is that which concerns the capital itself. If the net earnings of a mine are taxed at the same rate as ordinary income, the tax can be shown to be unfair to the mine owners, since the net earnings of a mine represent to a large extent capital. As ore is taken from a mine from year to year the property becomes constantly less valuable, until finally, when the ore has all been mined, the property is valueless. It is easy, therefore, to show that the net income from a mine should not be taxed on the same basis as income derived from other sources. This phase of taxation of mines is now receiving considerable attention in certain parts of the United States.

Our Mines Abroad.

No country has larger undeveloped promising mineral fields than Canada. It is important, therefore, if the mineral industry in this country is to make the progress it should, that capital be available. Heretofore most of the capital invested in mining enterprises has been furnished by Canadians themselves or by the people of the United States. If one reads the mining journals and the transactions of technical societies in Great Britain, he cannot but be struck with the small amount of attention the Canadian mineral industry attracts in the mother country. Pages are devoted to the industry of Australia and Africa, while paragraphs or sentences are given to that of Canada.

It was chiefly with the object of making the mineral resources of this country better known in Britain and on the Continent that the Canadian Mining Institute, with the assistance of the Dominion and the Provincial Governments, organized the trans-Canada excursion of 1908. Sufficient time has now elapsed to determine some of the results of the excursion. Not to enter into details, I may say that the results have been all that could be desired. Some important investments of capital have been made, and several Canadian mining engineers have been asked by British investors to make reports on properties. During the excursion leading mining engineers from abroad had the opportunity of visiting our mining camps and becoming acquainted with our mining men. Very cordial relations now exist between a number of mining societies in Britain, notably the Institution of Mining and Metallurgy, and the Canadian Mining Institute.

It seems to me that no more important work can be done by this Institute than that of making the mineral resources of the country better known in Great Britain and of encouraging the exchange of views between the technical men on the two sides of the Atlantic.

The Future of the Institute.

When we consider the work that the Institute has been able to accomplish in the past we have hope for its usefulness in the future. It can be said, I think, that the Institute's influence has been exerted on broad lines with the view of developing the industry in our own country, and of advancing the science and art of mining generally.

The members have been encouraged in their work by the recognition that has been extended to the Institute. One recognition that we have had is the acceptance of invitations to our annual meetings by distinguished fellow-workers in the United States. I can assure those gentlemen from the great Republic who have honoured us by attending this annual meeting that their presence is most highly appreciated, and that it affords us much encouragement.

As my presidency of the Institute ends with this annual meeting, I may be permitted to say that I hope the policy of the Institute will be the same in the future as it has been in the past. The field of work is vast. One-third of a continent awaits development.

For my successor in the presidency I can hope for nothing better than that his term of office will be as pleasant as mine has been.

According to A. A. Steele, writing in the bulletin of the American Institute of Mining Engineers, the Washington County, Missouri, barite is dug mostly from the residual clay. The common plan is to sink a pit, 3 feet in diameter, to a depth of from 6 to 9 feet, to the first lean clay below the upper barite layer. The miner then selects the richest side of the shaft, which he digs out beneath the upper clay, which is somewhat barren for from 3 to 6 feet below the surface. In this way he "drifts" as far as he thinks is safe, usually from 4 to 8 feet. Up to this stage all of the clay, flint and barite loosened is hoisted in a small bucket by a primitive hand windlass; but the miner usually sorts out the barite, which he recognizes from flint only by its greater weight, since it is completely covered with tough red clay. When the first drift is finished, all the waste from the new drifts is shovelled into it, and the miner digs other drifts wherever the ground looks good, so that the working soon resembles an inverted mushroom.

PRELIMINARY REPORT OF THE MINERAL PRODUCTION OF CANADA DURING THE CALENDAR YEAR, 1909.

Prepared by John McLeish, B.A.,

Chief of the Division of Mineral Resources and Statistics.

THE MINERAL PRODUCTION OF CANADA IN 1908.

(Revised).

Product		Quantity. (a)	Value. (b)

(a) Quantity of product sold or shipped.
(b) The metals, copper, lead, nickel and silver are for statistical and comparative purposes valued at the final average value of the refined metal in New York. Pig iron is valued at the furnace and non-metallic products at the mine or point of shipment.
(c) Copper contents of smelter products and ores exported, at 12·982 cents per pound.
(d) The total production of pig iron in Canada in 1909 was 757,162 tons valued at $9,581,864, of which it is estimated 607,718 tons valued at $7,359,649 should be credited to imported ores.
(e) Refined lead and lead contained in base bullion exported at 4·273 cents per pound.
(f) Nickel contents of matte produced, at 36 cents per pound (the lowest quotation for nickel in New York less 10 per cent). The value of the nickel contained in matte was, as returned by the operators, $2,810,748 or an average per pound of 10.7 cents.
(g) Estimated recoverable silver at 51.503 cents per ounce.
(h) Gross returns for sale of gas.
(i) Quantity on which bounty was paid and valued at $1.33 per barrel.

* Additional returns increase this item to $90,950.

PRELIMINARY REPORT ON THE MINERAL PRODUCTION OF CANADA IN 1909—*Concluded.*

892	16,623,415	1904	60,073,897
893	20,035,082	1905	69,525,170
894	19,931,158	1906	79,057,308
895	20,505,917	1907	86,865,202
896	22,474,256	1908	85,927,802
897	28,485,023		

The preliminary table of mineral production in Canada given herewith, shows the total value of the production in 1909 to have been in excess of $90,000,000. Compared with the total value for 1908, which was $85,927,002, the production of 1909 shows an increase of a little over 5 per cent. The actual increase in the mining industry in 1909, was however, somewhat greater than is indicated by this comparison. Owing to a slight increase in the method of compiling statistics of the quantities of metals produced the values for 1909 are less than they would otherwise have been.

Of the total production in 1909, $45,188,387—or 49.9 per cent. of the total—is credited to the metals, and $44,927,376—or 49.7 per cent.—to non-metallic products; a small allowance being made for mineral products not reported. Amongst the individual products coal is still the most important, its value constituting 17 per cent. of the total; silver occupies second place with 15.9 per cent.; gold and nickel come next with 10.8 and 10.5 per cent. respectively; copper contributes 7.8 per cent.; cement 5.8 per cent.; clay products 6.1 per cent.; asbestos 2.5 per cent.

The metals nearly all showed an increased output compared with 1908. The average prices remained fairly steady throughout the year, differing but slightly from those of the year before: copper, nickel and silver, being lower in price, while lead, spelter and tin were higher.

Average monthly prices of metals, 1906-09.

—	1906.	1907.	1908.	1909.
	Cts.	Cts.	Cts.	Cts.
Copper	19·278	20·004	13 208	12·982
Lead	5·657	5·325	4·200	4·273
Nickel	41·64	45·000	43·000	40·000
Silver	66·791	65·327	52·864	51·503
Spelter	6·193	5·962	4·720	5·503
Tin	39·819	38·166	29·465	29·725

In the non-metallic class there is a larger number of products showing increases than those showing decreases. The coal production was seriously reduced by the labour troubles in Nova Scotia. The asbestos shipments were slightly less and petroleum production shows a considerable falling off. In nearly all of the other items, however, there were important increases: particularly in corundum, gypsum, natural gas, salt, and in the structural materials, cement, clay products, lime and stone.

Smelter Production.—General statistics of smelter production were collected by this Branch for the first time in 1908 and the aggregate results of these operations during the past two years are shown in the accompanying table. It should be explained also that the figures include the results of the operations at the smelter at Northport, Wash.,—treating chiefly Canadian ores.

Smelter and Refinery Production in Canada, 1908 and 1909.

—		1908		1909	
		Refined Products.	Metals contained in matte, blister, base bullion, and speiss exported.	Refined Products.	Metals contained in matte, blister, base bullion, and speiss exported.
Gold	Ozs.	15,436	203,300	18,241	200,129
Silver	"	11,168,689	3,271,899	14,242,545	4,845,920
Lead	Lbs.	36,549,274	1,116,792	41,883,614	3,973,810
Copper	"	.....	51,965,289	.....	53,328,583
Copper sulphate	"	203,379	.....	51,405	.....
Nickel	"	.....	19,506,251	.....	27,041,857
Cobalt	"	.....	692,170	.....	1,721,083
White arsenic	"	1,431,052	.....	2,258,087	.....
Arsenic	"	.....	436,787	.....	1,074,516

The total ore charged to the furnaces in 1909 was 2,377,780 tons, of which slightly over 40,000 tons were imported. The smelter products exported for refining included, in 1908, copper matte, 7,649 tons; blister copper, 15,418 tons; Bessemer nickel-copper matte, 21,210 tons, and silver-cobalt-nickel speiss 1,326 tons. In 1909 these smelter products were base bullion 2,010 tons; copper matte 11,597 tons; blister copper 14,239 tons; Bessemer nickel-copper matte 25,845 tons; silver-cobalt-nickel speiss 2,660 tons.

Gold.—A preliminary estimate shows a slight decrease in gold production in 1909. The total production in 1908 was $9,842,105, to which the Yukon district contributed $3,600,000; British Columbia, $5,929,880; Nova Scotia, $244,799. In 1909 the Yukon shows a further increase, the value of the gold being estimated at $3,960,000. The total gold exports on which royalty was paid, were, according to the records of the Interior Department, during the calendar year, 239,766.35 ounces.

Complete statistics are not yet available as to the gold production in British Columbia, but the returns received appear to indicate a reduced output. The production in Nova Scotia will not differ much from that of the previous year.

Silver.—The rapid growth of Canada's silver production which has taken place during the past few years, continued during 1909. Increased production is reported from both British Columbia and Ontario. In the first mentioned province the silver is recovered with the lead from the galena ores of that province, of which there was an increased production in 1909. The metal also constitutes an important value in the gold-copper-silver ores smelted.

In British Columbia silver is recovered as fine metal at Trail and is contained in the matte and blister exported. In Ontario, where the production is practically all from the Cobalt district, a portion of the ores (8,384 tons in 1909) is treated in Canadian metallurgical works producing silver bullion, white arsenic, and a speiss containing silver, cobalt, nickel, etc.; the balance of the ore being exported for treatment abroad. The total production of recoverable silver in Canada is estimated at 27,878,590 ounces, valued at $14,358,310, the average price of silver for the year being 51.503 cents.

The price of refined silver varied between a maximum of 53⅞ cents per ounce on May 5, and a minimum of 50¼ on March 3.

The production from the Cobalt district again shows a considerable increase over the previous year, but not so large an advance as was made in 1908 over 1907. According to returns received from 31 shipping mines, there were shipped during 1909 about 28,042 tons of ore and 2,967 tons of concentrates, a total tonnage of

31,000. The silver contents of ore shipped are returned as 22,581,788 ounces, or an average of 805.284 ounces per ton, and for the concentrates shipped 3,639,475 ounces, or an average of 1,226.651 ounces per ton. Bullion shipped from the mines contained 143,440 fine ounces of silver.

The total silver contents of ore, concentrates and bullion shipped from the mines was 26,364,703 ounces. The mine owners receive payment for only 93 to 98 per cent. of the silver contents; and in valuing the production a deduction of 5 per cent. is made from silver contained in ore and concentrates to cover losses in smelting and refining. On this basis the silver recovery is estimated at 25,128,590 ounces, and valued at $12,941,978. Payments for cobalt contents were reported as $90,750, and the total value of the year's output was a little over $13,000,000 without deduction for freight and treatment charges.

The number of men employed in shipping mines was reported as 2,768, and wages paid $2,396,742. Incomplete returns of concentration showed 127,271 tons of ore treated, producing 3,213 tons of concentrates.

In 1908 the shipments were 25,682 tons of ore and concentrates containing 19,398,545 ounces of silver, or an average of 755 ounces per ton.

The exports of silver in 1909, for the whole of Canada, as reported by the Customs Department, were 31,126,504 ounces, valued at $15,719,909.

Copper.—Although refined copper is not produced in Canada, the copper ores are mostly reduced to matte or blister copper carrying additional values in the precious and other metals. Some copper pyrites ore is mined in Quebec province, from which the copper is recovered after the ore has been used as a source of sulphur, and a small quantity of copper ore is exported from British Columbia coast mines to United States smelters for treatment.

Statistics are not available at the present time to show the total quantity of copper contained in ores shipped from the mines. The total production of copper, however, contained in blister and matte produced and estimated as recoverable from ores exported, was in 1909 approximately 54,061,106 pounds. In 1908 the production of copper estimated on the same basis was 52,928,386 pounds, an increased production of about 2 per cent. being, therefore, shown in 1909.

Of the production in 1909, Ontario is credited with 15,746,699 pounds, and British Columbia with 37,314,407 pounds. The latter figure may be subject to more or less variation as complete returns had not been received of all ore exported.

The New York price of electrolytic copper varied between the limits of 12 cents and 14⅝ cents per pound, the average monthly price being 12.982, as compared with an average monthly price of 13.208 cents in 1908.

The total exports of copper contained in ore matte and blister, according to Customs Department returns, were 54,447,750 pounds, valued at $5,832,246.

Lead.—The total production in 1909 of pig and manufactured lead and lead contained in base bullion exported was 45,857,424 pounds, valued at the average price of refined lead in New York at $1,959,488.

It is possible that there was also some lead ore or lead concentrates exported, of which no record has yet been received. Customs Department statistics indicate such an export of upwards of 2,000,000 pounds.

The production of refined lead, and lead contained in base bullion exported in 1908, was 37,666,066.

Customs Department statistics in this year also indicate an export of lead ore or concentrates, and the total production in 1908, of lead available for consumption was estimated at 40,891,448 pounds, an increased production in 1909 is, therefore, shown of from 5,000,000 to 7,000,000 pounds. This production in both years was all from the province of British Columbia.

The total amount of bounty paid during the twelve months ending December 31, 1909, on account of lead production, was $346,527.98.

The exports of lead in ore, concentration, base bullion, etc., during the year, were 3,116 tons, and of pig lead 5,650 tons, or a total of 8,766 tons. From 14,000 tons to 15,000 tons of domestic production were, therefore, available for home consumption.

The price of lead in New York during 1909 averaged 4.273 cents per pound, varying between 3.95 cents in March and 4.70 cents in December. In 1908 the average was 4.200 cents per pound. The London price per long ton varied between £ 12 10s. and £ 13 16s., averaging £13.049.

Nickel.—The nickel industry was particularly active during 1909, the largest production on record being shown. Although important quantities of nickel are contained in the cobalt silver ores of Coleman township, the Sudbury district continues to be the chief source of nickel production. The same companies are carrying on active operations: the Mond Nickel Co., at Victoria Mines, and the Canadian Copper Co., at Copper Cliff. The ore is first roasted and then smelted to a Bessemer matte containing from 77 to 82 per cent. of the combined metals, copper and nickel; the matte being shipped to the United States and Great Britain for refining.

The total production of matte in 1909 was 25,845 tons, valued at the furnaces at $3,913,012. The metallic contents were copper 15,746,699 pounds, nickel 26,282,991 pounds.

The aggregate results of the operations on the Sudbury district nickel-copper ores during the past four years are as follows:—

	1906. Tons of 2,000 lbs.	1907. Tons of 2,000 lbs.	1908. Tons of 2,000 lbs.	1909. Tons of 2,000 lbs.
Ore mined	343,814	351,916	409,551	451,892
Ore smelted	340,059	359,076	360,180	462,336
Bessemer matte produced	20,364	22,041	21,197	25,845
Bessemer matte shipped	20,310	22,025	21,210	.....
Copper contents of matte shipped	5,265	6,996	7,503	7,873
Nickel "	10,745	10,595	9,572	13,141
Spot value of matte shipped	$4,628,011	$3,289,382	$2,930,989	$3,913,012
Wages paid	1,117,420	1,278,694	1,286,265	1,234,903
Men employed	1,417	1,660	1,690	1,735

Exports of nickel contained in ore, matte, etc., as complied from Customs reports were for the twelve months ending December 31, as follows:—

	1906. Pounds.	1907. Pounds.	1908. Pounds.	1909. Pounds.
To Great Britain	2,716,892	2,518,338	2,554,486	3,843,763
To United States	17,936,953	16,857,997	16,865,407	21,772,635
	20,653,845	19,376,335	19,419,893	25,616,398

Nickel contained in silver cobalt ores:—The mine owners received no payment for nickel contents and complete statistics are not available as to the total quantity of nickel contained in these ores, of which about 31,009 tons were shipped during 1909. Of the total shipments, 8,384 tons were treated in Canadian metallurgical works at Copper Cliff, Deloro and Thorold, producing silver bullion and white arsenic, the remaining speiss or residues amounted to 2,660 tons and contained silver, cobalt, nickel and arsenic, the nickel con-

tents totalling 758,966 pounds and the cobalt contents 1,721,083 pounds.

The price of refined nickel in New York was quoted at from 40 to 50 cents per pound, the quotations in December being "large lots, contract business 40 to 45 cents per pound. Retail spot from 50 cents for 2,000 pound lots up to 55 cents for 500 pound lots. The price for electrolytic is 5 cents higher."

Nickel is quoted on the London market at prices equivalent to, or slightly in excess of those in New York.

Iron Ore.—The total shipments of iron ore from mines in Canada in 1909 were 268,043 short tons, valued at $659,120, as compared with 238,082 tons, valued at $568,189 in 1908. The shipments in 1909 may be classified as magnetites, 73,420 tons; hematite, 190,473 tons; bog ore, 3,330 tons; titaniferous magnetite (sand) for experimental purposes, 820 tons. In 1908 the ores shipped included magnetite 49,946 tons; hematite 173,164 tons; carbonate ore, 4,869 tons; bog ore, 10,103 tons.

Exports of ore from Canada during 1909, as recorded by the Customs Department, were 21,956 tons, valued at $61,965.

Although not a portion of the Dominion of Canada, it may be of interest to state the iron ore shipments from Newfoundland during 1909. The two Canadian companies operating the Wabana mines shipped during the year 991,115 gross tons, or 1,110,049 short tons, of which 697,068 tons were shipped to Sydney and 412,981 tons to the United States and Europe.

Pig Iron.—An increase of 20 per cent. is shown in the production of pig iron in Canada in 1909 as compared with 1908, despite the fact that the Londonderry furnace was out of commission during the whole year. The total production during 1909 was 757,162 short tons, valued at $9,581,864 as compared with 630,835 tons, valued at $8,111,194, in 1908. These figures do not include the output from electric furnace plants, making ferro products, which are situated at Welland and Sault Ste. Marie, Ontario, and Buckingham, Que.

Of the total output of pig iron during 1909, 17,003 tons, valued at $371,368, or $21.84 per ton, were made with charcoal as fuel, and 740,159 tons, valued at $9,210,496, or $12.44 per ton, with coke. The amount of charcoal iron made in 1908 was 6,709 tons, and iron made with coke 624,126 tons. The classification of the production in 1909, according to the purpose for which it was intended, was as follows:—Bessemer, 222,931 tons; basic, 400,921 tons; foundry, including miscellaneous, 116,307 tons.

The amount of Canadian ore used during 1909 was 231,994 tons, imported ore, 1,234,990 tons; mill cinder, etc., 25,508 tons. The amount of coke used during the year was 919,271 tons, comprising 412,016 tons from Canadian coal and 507,255 tons imported coke or coke made from imported coal. The consumption of charcoal was 1,782,258 bushels. Limestone flux was used to the extent of 526,076 tons. In connection with blast furnace operations there were employed 1,486 men and $879,426 were paid in wages.

The total daily capacity of 16 completed furnaces was, according to returns received, 2,735 tons. The number of furnaces in blast on December 31, 1909, was 11.

The production of pig iron by provinces in 1908 and 1909 was as follows:—

Province	1908.			1909		
	Tons.	Value	Per ton.	Tons	Value	Per ton.
		$	$ cts.		$	$ cts.
Nova Scotia	352,642	3,554,540	10,08	345,380	3,453,800	10 00
Quebec	6,709	171,383	25 55	4,770	125,623	26 34
Ontario	271,484	4,385,271	16 15	407,012	6,002,441	14 75
Total	630,835	8,111,194	12 86	757,162	9,581,864	12 65

Steel.—Returns were received from eight steel plants at which 2,073 men were employed and $1,284,940 paid in wages during 1909. The total production of ingots and castings was 754,719 short tons, with an estimated value of $14,359,710, as compared with 588,763 tons, valued at $10,916,602, in 1908.

Details of production during the two years are as follows:—

	1908.		1909.	
	Tons.	$	Tons	$
Ingots—Open hearth (basic)	443,442	7,684,277	535,988	9,372,615
Bessemer (acid)	135,557	2,535,287	203,715	3,829,012
Castings—Open hearth	9,051	617,126	14,013	1,043,370
Other steels	713	79,912	1,003	114,713
Total	588,763	10,916,602	754,719	14,359,710

Iron and Steel Bounties.—Following is a statement of the bounties paid on iron and steel during the calendar years 1908 and 1909, as kindly furnished by the Trade and Commerce Department. As no bounty is paid on iron made from mill cinder or ingredients other than ore, the figures do not show the total output of the furnaces but only those quantities on which bounty was paid.

	1908.		1909	
	Quantity on which Bounty was paid.	Bounty.	Quantity on which Bounty was paid.	Bounty
	Tons,	$ cts.	Tons.	$ cts.
Pig iron made from Canadian ore	101,647	213,458 34	126,297 55	214,705 80
Pig iron made from imported ore	517,427	569,166 93	607,718 09	425,402 64
Total, pig iron	619,074	782,628 27	734,015 64	640,108 44
Steel ingots	556,289	917,876 63	729,189 37	766,470 41
Steel wire rods	49,630	297,778 68	81,405 42	488,432 70
Total bounty paid on iron and steel		1,998,283 58		1,895,011 55

White Arsenic.—The total output of white arsenic as reported by three firms making this product was 2,258,187 pounds, valued at $64,100. In addition the residues or speiss from these works exported contained 1,074,511 pounds of arsenic. This is all obtained from that portion of the Cobalt ores treated in Canada. No record is available of the total arsenical contents of these ores. The exports of arsenic are reported as 3,111,249 pounds, valued at $119,673. The production of white arsenic in 1908 was 1,431,000 pounds, valued at $41,060, and of arsenical ore and concentrates 986 tons, valued at $17,506.

Asbestos.—A feature of special interest in connection with the asbestos industry during 1909 has been the consolidation of interests amongst a number of the larger producers, resulting in the formation of the Amalgamated Asbestos Corporation, Limited.

While the actual shipments of asbestos were somewhat less in 1909 than in 1908 the stocks on hand at the end of the year are reported considerably larger than on December 31, 1908.

The total shipments of crude and mill stock in 1909 were 63,349 tons, valued at $2,284,587, as compared with shipments of 66,548 tons, valued at $2,555,361, in

1908, the decrease being 3,199 tons, or 4.8 per cent. The stocks on hand December 31, 1909, were about 20,920 tons, valued approximately at $1,179,679, as compared with stocks on hand December 31, 1908, of 8,669 tons, valued at $596,095.

The total shipments, showing details of crude and mill stock were in 1908 and 1909, as follows:—

	1908			1909		
	Short Tons	Value	Per ton.	Short Tons.	Value	Per ton.
		$	$ cts.		$	$ cts.
Crude, No 1	857½	257,752	300 59	912·3	246,655	270 37
" 2	2,488	411,480	165 38	2,162	328,855	152 11
Mill Stock, No 1	5,282½	425,448	80 54	14,776	785,731	53 18
" 2	45,545½	1,345,750	29 33	32,417	800,728	24 70
" 3	12,374½	114,931	9 29	13,082	122,618	9 37
Total asbestos	66,548	2,555,361	38 40	63,349·3	2,284,857	36 06
Total asbestic	24,225	17,974	0 74	23,951	17,188	0 72
Grand total	90,773	2,573,335		87,300·3	2,301,775	

Exports of asbestos according to Customs returns were:—

	Tons.	Value.
		$
Twelve months ending December, 1907	56,753	1,669,299
1908	61,210	1,842,763
1909	56,971	1,729,857

Corundum.—The quantity of corundum ore treated during the year was 35,894 tons, from which was produced 1,579 tons of grain corundum. The total shipments were 1,491 tons, valued at $157,398, or an average of a little over 5 cents per pound.

Coal and Coke.—The total coal production in Canada, in 1909, comprising sales and shipments, colliery consumption and coal used in making coke, is estimated at 10,411,955 short tons, valued at $24,431,351. This is a smaller production than in either of the two preceding years, though the total may be slightly increased when more complete returns are received. The western provinces each show an increased production of coal in 1909, but not sufficient to counteract the reduced output in Nova Scotia, which resulted from the coal miners' strike. The aggregate decrease for the whole of Canada was about 474,356 tons, or 4.36 per cent., while Nova Scotia alone showed a falling off of 968,789 short tons, or 14.56 per cent.; the aggregate increase in the western provinces being 505,404 tons, or 12.11 per cent.

Of the total production Nova Scotia contributed 54.5 per cent., Saskatchewan and Alberta 20.5 per cent. and British Columbia 24.3 per cent.

The production by provinces was approximately as follows, the figures for 1907 and 1908 being also given:—

Province.	1907		1908.		1909.	
	Tons.	Value.	Tons.	Value.	Tons.	Value.
		$		$		$
Nova Scotia	6,354,133	12,764,999	6,652,539	13,364,476	5,683,750	11,418,249
British Columbia	2,364,898	7,390,306	2,333,708	7,292,838	2,538,004	7,931,263
Alberta	1,591,579	3,836,286	1,685,661	4,127,311	1,978,843	4,730,270
Saskatchewan	151,232	252,437	150,556	253,790	163,329	253,073
New Brunswick	34,584	77,814	60,000	135,000	49,029	98,496
Yukon Territory	15,000	60,000	3,847	21,158	.....	.....
Total	10,511,426	24,381,842	10,886,311	25,194,573	10,411,955	24,431,351

The total production of oven coke in 1909 was about 875,080 short tons, valued at $3,557,147, being a slight increase over the production in 1908. At the ovens of the Dominion Iron and Steel Co. at Sydney a quantity of imported coal was used, the supply of domestic coal being insufficient on account of the strike. The Atikokan Iron Company at Port Arthur uses imported coal exclusively. At all other ovens Canadian coal is used. At the end of the year there were in Nova Scotia 670 ovens in operation, 64 idle and 120 building. In Alberta 226 were in operation and 40 idle, and in British Columbia 767 in operation and 753 idle. The ovens of the Dominion Iron and Steel Co. are of the Otto Hoffman by-product type and there were recovered as by-products 4,016,824 gallons of tar and 3,351 short tons of sulphate of ammonia.

Feldspar.—Total shipments are reported as 10,286 tons, valued at $35,694. This includes a quantity of high grade "dental spar" shipped from the Villeneuve mine, Quebec, and valued at from $16 to $20 per ton at Buckingham.

Petroleum and Natural Gas.—The production of crude petroleum was as usual nearly all derived from the Ontario peninsula. Direct returns from the producers have not been obtained, but the production upon which bounty was paid, ascertained by the Trade and Commerce Department, was 14,726,433 gallons, of which 3,328 gallons were produced in New Brunswick. This is equivalent to 420,755 barrels, and at an average price of $1.33 per barrel was valued at $559,604. The production in 1908 was 527,987 barrels, valued at $747,102, an average per barrel of $1.34, showing a decrease of about 20 per cent. in the quantity produced. The total bounty paid in 1909 was $220,896.50 as compared with $227,193.21 in 1908 and $414,157.89 in 1907.

While the production of petroleum has been falling off the receipts from natural gas sold have been increasing. The producing gas wells are located in the counties of Welland, Haldimand, Norfolk, Kent, Essex, and Bruce, in Ontario, and at Medicine Hat and vicinity in Alberta. The total receipts from gas sold in 1909 were about $1,205,943, the figures representing, with one or two exceptions, the total values paid by the consumers.

The quantity of gas sold or used during the year was over 6,000,000 M. feet. Of the total value about 95 per cent. is to be credited to Ontario. The total receipts in 1908 were $1,012,660.

Phosphate.—The price of this mineral has been increasing. There is a growing demand for it and a revival of phosphate mining appears to be imminent.

Salt.—Complete returns of salt production received show total sales of 84,037 tons, valued at $415,219 for the salt alone. Packages used were valued at $175,612; stock on hand at the end of the year was reported as 2,671 tons; 185 men were employed, and $96,116 paid in wages.

Lime.—Fairly complete statistics of lime production have been received for 1909. The total sales and shipments are reported as 5,163,874 bushels, valued at $1,049,473, or by provinces as follows: Nova Scotia and New Brunswick, 747,696 bushels, valued at $179,380; Quebec, 1,155,167 bushels, valued at $277,253; Ontario, 2,434,686 bushels, valued at $404,782; Western Provinces, 826,325 bushels, valued at $188,058.

Portland Cement.—Complete statistics have been received from all but two cement manufacturers in 1909. These, however, will not increase the totals by more than 2 or 3 per cent. Subject to this correction the total quantity of cement made during the year was 4,089,191 barrels as compared with 3,495,961 barrels in 1908, an increase of 593,230 barrels, or 17 per cent.

The total quantity of Canadian Portland Cement

sold during the year was 4,010,180 barrels, as compared with 2,665,289 barrels in 1908, an increase of 1,344,891 barrels, or 50 per cent.

The total consumption of Portland cement in 1909 including Canadian and imported cement, was 4,152,374 barrels, as compared with 3,134,338 barrels in 1908, an increase of 1,018,036 barrels, or 32 per cent.

Detailed statistics of production during the past three years have been as follows:—

	1907.	1908.	1909
	Barrels.	Barrels	Barrels
Portland cement sold	2,436,093	2,665,289	4,010,180
" manufactured	2,491,513	3,495,961	4,089,191
Stock on hand January 1	299,015	383,349	1,093,493
" December 31	354,435	1,214,011	1,172,504
Value of cement sold	$3,777,328	$3,709,063	$5,266,008
Wages paid	956,080	1,274,638	1,182,090
Men employed	1,786	3,029	2,411

The average price per barrel at the works in 1909 was $1.31, as compared with $1.39 in 1908.

The imports of Portland cement into Canada during the twelve months ending December 31, 1909, were 497,678 cwt., valued at $166,669. This is equivalent to 142,194 barrels of 350 pounds, at an average price per barrel of $1.17. The imports in 1908 were 469,049 barrels, valued at $531,045, or an average price per barrel of $1.13. The duty is 12½ cents per hundred pounds.

As there is very little cement exported from Canada, the consumption is practically represented by the Canadian sales together with the imports.

Following is an estimate of the Canadian consumption of Portland cement for the past five years:—

Calendar Years.	Canadian		Imported		Total	
	Barrels.	Per cent	Barrels	Per cent.	Barrels.	Per cent
1905	1,346,548	59	918,701	41	2,285,249	
1906	2,119,764	76	665,845	24	2,785,609	
1907	2,436,093	78	672,630	22	3,108,723	
1908	2,665,289	85	469,049	15	3,134,338	
1909	4,010,180	97	142,194	3	4,152,374	

CONSERVATION WORK OF THE GEOLOGICAL SURVEY FOR THE YEAR ENDING MARCH 4, 1910.

During the last twelve months the conservation work of the United States Geological Survey has included investigations relating to coal, oil, and phosphate deposits, and to water-power sites on the public domain.

Public Coal Lands.

Coal land withdrawals were made covering 7,675,000 acres not previously withdrawn, and the form of withdrawal affecting an additional 9,000,000 acres was changed to cover all forms of entry instead of coal entry alone. The new regulations of April 10, 1909, for the classification and valuation of coal lands, materially increased the sale price of these lands and fixed more definitely the standards of coal classification. Thus, for example, under the old regulations, in eight widely separated townships the total area classed as coal land was 66,320 acres, and the sale price was fixed at $2,088,600, whereas, under the new regulations, the area in the same eight townships classed as coal land is 126,663 acres, and the sale price is $15,777,668—an increase in area of over 100 per cent., and in price over 600 per cent.

Under the old regulations the maximum price per acre for coal land was fixed at $75; under the new regulations the maximum price per acre thus far fixed for any particular area is $465. The maximum valuation of a single township under the old regulations was $949,600; under the new regulations it is $9,206,894. Special efforts have been made to release from existing withdrawals all noncoal areas, and of the total area classified during the year, amounting to 17,200,000 acres, much the larger part, or about 14,000,000 acres, has been classed as noncoal land. The sale price of the 3,436,000 acres classed as coal land has been fixed at $191,490,000. The same land, if sold at the minimum price fixed by law, would have yielded $62,477,000.

Public Phosphate Lands in Wyoming, Idaho, and Utah.

Phosphate land withdrawals in force March 4, 1909, covered all vacant public lands in an area comprising 4,493,551 acres in Wyoming, Utah, and Idaho. During the year areas covering 2,389,141 acres were restored to entry, for the field work showed that they contained no phosphate. Additional withdrawals including 399,693 acres have been made, and the form of withdrawal has been changed so as to cover entered as well as vacant lands. All unpatented lands in an area of 2,504,103 acres are now affected by phosphate withdrawals.

Western Public Oil Lands.

The California oil-land withdrawals made prior to March, 1909, aggregating 2,313,482 acres, prevented the acquisition as oil or as mineral lands as well as for agricultural land laws. All lands covered by these withdrawals could be legally exploited for oil or other minerals. During the year these lands were excepted from acquisition as oil or as mineral lands as well as for agricultural use. New withdrawals were made in the States of California, Colorado, Oregon, Utah, and Wyoming of a total area of 2,130,510 acres. In California there were restored to entry 956,916 acres that field examination had shown to be nonoil land. The area now covered by oil withdrawals is 3,487,076 acres.

Public Power-Site Withdrawals.

On March 4, 1909, power-site withdrawals were in force covering vacant public lands on twenty-nine rivers in nine states. These withdrawals have since been reviewed by the Geological Survey, the form of withdrawal has been changed to include all entered as well as all vacant lands, and the lands that were found to be not valuable for the purpose for which the withdrawal was made have been restored to entry. New withdrawals have been made along ninety-seven rivers covering land not involved in previous withdrawals and increasing the total number of states affected to eleven. These power-site withdrawals now cover about 1,300,000 acres of vacant public land and 200,000 acres of entered land.

PRELIMINARY STATEMENT OF THE MINERAL PRODUCTION OF THE PROVINCE OF QUEBEC DURING THE YEAR 1909.

By Theo. C. Denis, Superintendent of Mines.

Preliminary statement of the mineral production in the province of Quebec during the calendar year 1909.

(Subject to revision.)

The total value of the mineral production of the Province of Quebec for the calendar year ending December 31st, 1909, according to the returns received by the Bureau of Mines of the Province, amounted to $5,424,808. This is a slight decrease as compared with the previous year, the figures for which are given in an adjoining column.

Asbestos.—The total shipments of asbestos and asbestic during the year totalled 88,315 tons, 2,000 lbs., valued at $2,315,816, as follows:—

Crude asbestos, tons	3,298	$ 581,618
Mill stock, tons	60,556	1,713,876
	63,854	2,295,494
Asbestic, tons	24,461	20,322
	88,315	$2,315,816

This is a slight decrease as compared with the shipments of the previous year, but this is not to be taken as a decrease of activity of the industry. In fact, one of the main causes of this lower figure has been that preparations were being made for a higher production in 1910. Several mills either curtailed their production, or even stopped operations, during more or less extensive alterations and improvements for greater activity. There are at the present time four new large mills being erected.

(Subject to revision)

	Quantity.	Value 1909 $	Value 1908 $

* Made up of 5 % of value of products Nos. 16-17-18 and 10 % of value of No. 19.

It sounds already like ancient history to mention that the great feature of the asbestos industry during the year 1909 has been the consolidation of various companies into two large companies, viz.: the Amalgamated Asbestos Corporation, Ltd., and the Black Lake Consolidated Asbestos Co., Limited. The Amalgamated Asbestos Corporation was formed with a capital of $25,000,000, to take over and operate the mines and mills of the following companies: King's Asbestos Mines, Ltd., of Thetford; Beaver Asbestos Company, of Thetford; British Canadian Asbestos Co., of Black Lake; Standard Asbestos Company, Ltd., of Black Lake; Dominion Asbestos Company, of Black Lake.

The Black Lake Consolidated Asbestos Company, Limited, was formed with a capital of $5,000,000 to take over the properties of the Union Asbestos Mine, Black Lake; the Black Lake Chrome and Asbestos Company, of Black Lake; the Dominion Chrome Company, of Black Lake; the Imperial Asbestos Company, of Black Lake. This amalgamation did not produce any asbestos during the year 1909, but it is at present erecting one of the largest mills of the district, which is expected to start operations in May.

The following companies made returns of production for the year 1909:—

Amalgamated Asbestos Corporation, Ltd., Thetford and Black Lake.

Asbestos and Asbestic Company, Ltd., Danville.

Bell Asbestos Mines, Thetford.

Broughton Asbestos Fibre Co., East Broughton.

Eastern Townships Asbestos Co., Thetford.

Jacobs Asbestos Mining Co., Thetford.

Johnson's Asbestos Company, Thetford and Black Lake.

Ling Asbestos Company, East Broughton.

Robertson Asbestos Mining Co., Robertsville.

Mica.—The mica industry was very inactive during 1909, and the market for this product was unsatisfactory. At the prices offered by buyers the producers could not make ends meet, and as a result the figures of production are considerably below last year's.

Cement.—The production of cement in the Province of Quebec in 1909 shows a substantial increase as compared with 1908. This industry was also characterized by a consolidation of interests, national in scope. The Canada Cement Company took over the three largest plants in the Province of Quebec, as well as others in Ontario and in the western provinces. It is said that very substantial savings in freight and in management can be effected by the amalgamation, and the company claims that the consumer will derive benefit from such savings.

Other Building Materials.—These comprise building stones, lime, marble, bricks, tile and pottery manufactured from Canadian clay. It is, of course, very difficult to gather complete figures of production of these materials. In past years it has been the custom of the Quebec Bureau of Mines to adopt the figures given by the last Dominion census, but this year we made an attempt to get returns direct from the producers. The figures for 1909 are not, therefore, comparable with the production of the previous year. The results of our endeavour have been very gratifying, as will be seen by glancing over the table for 1909, which is compiled from direct returns. I must say, however, that our work in this respect has been considerably lessened by the use which we freely made of the lists of producers of stone, bricks, lime and pottery given in the Report on the Mining and Metallurgical industries issued by the Mines Branch of Ottawa, and of the lists compiled by Mr. McLeish, which are printed in leaflets.

Mining for wood is the rather unusual industry found at Mongtze, Upper Tonkin, by the French Consul. At some time a pine forest was swallowed up, and the trees—lying in a slantingg direction and some of them a yard in diameter—are covered by eight or ten yards of sandy soil. The perfect preservation of the tops indicates that the trees were buried at a comparatively recent period. The timber supplied seems to be imperishable, and is especially prized by the Chinese as coffin-making material.

NOTES ON PROSPECTING IN ONTARIO.

Written for the Canadian Mining Journal by W. M. Goodwin.

The Director of the Geological Survey has pointed out in one of his reports that what is probably the greatest remaining region in the world unexplored by the prospector lies in Canada. A considerable part of this area, a part comparatively easy of access, lies in Ontario, and consists of pre-Cambrian rocks, a geological horizon considered to be specially favourable for mineral deposits of economic importance.

The National Transcontinental Railway runs from end to end of New Ontario through a stretch of country that is unprospected, except in a few special localities, and along the banks of the main rivers. All the territory north of this line is marked on maps as unprospected; but even south of it the country down as far as the C. P. R. has been very little explored in the manner that has brought to light deposits such as Cobalt, Gowganda, and Porcupine. Except for the first accidental discovery at Cobalt, these discoveries have been the result of patient, careful, and systematic prospecting, a style of prospecting that is even yet not followed by any great number of men outside of certain camps.

Up to the present far too great a proportion of prospectors have done their "work" from their canoes, along the banks of the rivers, on the shores of the lakes, and along the old portage trails of the Indians and Hudson Bay Company's trappers. The probability is that every traveller interested in rocks and minerals, since the time of the earliest explorer, has examined these self-same spots. Thus the prospector, though he may indeed be following in the footsteps of the pioneer, is not likely to "find a mine" unless he sidesteps a little and gets on new ground.

To do really effective prospecting, one must get off the principal routes of travel and well-used trails, and dive right into the bush. Wise prospectors adopt this method of finding a place to work, leaving the nice rocky shores of our beautiful lakes to the appreciative attention of the man who is taking a summer outing.

To strike out into the green bush without a map—for there are no maps of our unsurveyed lands that show more than the main topographical features—is not nearly so hazardous an undertaking as one not accustomed to it might imagine. By using a fair amount of common sense and providing himself with a proper and adequate outfit, an ordinary man, even though his experience in the bush may not have been very extensive, can travel quite comfortably and explore localities that have never been looked at before. Common sense every man has to provide for himself; but a few hints about methods of working and outfit may prove useful to those prospectors or prospective prospectors who have not found something better for themselves.

To make a trip a long distance away from a railroad means a lot of food to use on the road to and from. Consequently, as the capacity of one's canoe and one's back is limited, the length of time spent in actual prospecting diminishes as the distance from the railroad increases. This necessarily makes smaller the chances of finding a mineral deposit. Besides, it is only occasionally that deposits of ore at any considerable distance from a railroad or easily navigable water route are of immediate value; and it is ordinarily only large corporations that can afford to hold such distant deposits until a railroad is built to them.

Hence it behooves the prospector to take advantage of the numerous openings on "good ground" not too far from railroads already built, in process of construction, or about to be built. A man who has not looked into the matter will be surprised to find how much promising ground near the railroads has not been touched by the prospector. The townships of Whitney and Tisdale were surveyed before the T. & N. O. R. had reached Cobalt, and were even then considered to be not so very far from a source of supplies. Yet it is only now, several years after the railroad has been in operation only a comparatively few miles from Porcupine Lake, that careful searching has revealed the presence of gold deposits there. The National Transcontinental Railway and the C. N. R. from Sudbury to Port Arthur will make accessible for prospecting areas that will keep great numbers of men busy for many years.

Considering the matter in a broad way, it may be said that the same conditions of topography, climate, and accessories such as flies, exist throughout that part of Northern Ontario accessible to the prospector. Hence the outfit found best in one district will probably be best in the others. The canoe is usually the most important item; but if a man is working near a railroad he may not have a great deal of use for one. Canvas-covered canoes, as manufactured by the Chestnut Canoe Co., are much used now, and have many points of superiority over basswood or cedar. The tough, well-filled canvas resists abrasion to a remarkable extent, and the wide cedar ribs make the bottom the next thing to puncture-proof. The good wearing qualities have been demonstrated beyond a doubt, and offset the higher price. By leaving a canvas canoe out in the sun, water absorbed by the cedar sheathing and ribs is evaporated, and its weight can be kept about the same as when it left the factory, a thing that is impossible with the ordinary wooden canoe. Patching is very easy with shoemaker's tacks and pitch or spruce gum. A 16-foot canoe is the one most commonly used, and, if of a good stout model, is in ordinary waters about as safe as a canoe can be. The writer has used for a whole season a 12-foot canvas, and although it proved rather too short for rapids, the ease with which it was packed through the bush without cutting portages—a thing that is next to impossible with a 16-foot canoe—bears great weight in his opinion of its usefulness to the prospector. On one trip this canoe carried two men and a 300-lb. load without being overloaded. Of course, no canoe is safe in inexperienced hands, and the smaller the canoe the greater is the risk, if one is not thoroughly familiar with the use of canoes of every sort.

The prospector generally uses a small canvas tent, in which he rolls up his blankets, dunnage, cooking utensils and grub when on the march. An outfit that is more conducive to comfort than this one, though more expensive, is a silk tent and oiled canvas tarpaulin. The tarpaulin is just as serviceable and handy a receptacle for dunnage as the canvas tent, and with the silk tent weighs no more than the canvas outfit. The advantage of its use is that it will keep the blankets dry even if the ground or brush bed over which it be spread be quite wet. This will give a man a dry and comfortable bed even when he has made camp in a rainstorm.

A necessary addition to the tent of the prospector in Ontario who wants to spend the fly season (the latter

part of June, July and the first part of August) at his work, is a fly net. This is best made of cheese cloth or some other porous material with mesh smaller than mosquito netting, which latter lets the black flies through. If made so full at the bottom that it can be lifted up over the head to enter, it will be found most satisfactory. A sod-cloth round the bottom edge of the tent, on which rocks, poles, or the blankets can be spread on the inside, is another adjunct of the completely provided tent. Some prefer a complete little tent of cheese-cloth, to be hung up inside the other tent. With a safe and sure place of retreat of this sort and a liberal supply of a good fly oil, a man with a very ordinary amount of restraint over his tongue can pass the whole season in the bush without rendering himself liable to eternal damnation. A very effective as well as pleasant fly oil is made from 2 parts of olive oil with 1 part of oil of citronella. This mixture is the best the writer has found among dozens tried.

The prime necessity for the prospector, as for everybody else, is food. A very liberal allowance is 100 lbs. per man per month; usually two-thirds of this will do. The old rule is one-third pork, one-third flour and the rest beans, rice, dried apples, oatmeal, tea, sugar, salt, and baking powder. With the addition of desiccated potatoes, concentrated soup tablets, butter, condensed cream, dried eggs, and cocoa, an almost luxurious bill of fare can be prepared. Such supplies as flour and fruit are best put up in small cotton bags with tie strings attached. It is a good practice to carry this grub in a stout water-proofed canvas bag.

For cooking, one uses a frying-pan, a nest of four or five small tin pails with covers, and perhaps a reflector or Dutch oven for baking beans and bread. A spoon per man is necessary, and a fork each is handy, but a table-knife is superfluous, as each man carries a good jack-knife. A tin plate and bowl each completes this part of the outfit. An extra frying-pan is easily made by putting a split stick an inch or so in diameter of handy length for a handle on the edge of a plate. The culinary art is learned only by experience, and a man soon becomes proud of his flapjacks, bacon, and baked beans.

If a trip is not to be of more than a few weeks' duration, a change of underclothing, three or four pairs of socks (one usually burns a few), a pair of short oiled moccasins for "house slippers," and a sweater or short jacket should be taken extra. The ordinary clothing is woollen underwear, thick woollen socks, high boots or shoe-packs, stout canvas or cloth trousers, a flannel shirt, and slouch hat. All-important to the man who goes off the beaten trails is his pocket compass. The writer keeps his compass tied to his trousers, and never parts with the former unless the latter go too. The sun gives you your direction when not directly overhead; but the compass is a sure guide, fair weather or foul, except in rare cases when influenced by a large magnetic ore body. A water-proof matchsafe and a pocket lens are very useful.

A handy outfit for repairs is found in the old-fashioned "house-wife." This is a little cloth or leather roll with pockets containing needles, pins, thread, yarn and buttons. If you add a roll bandage, adhesive plaster, a few assorted pills, a brad-awl, a small file, tacks of various sizes, wax-end and cobbler's thread, you have the essentials of a tailor and a shoemaker, and with axe and knife, a carpenter's outfit, so far as needs in the bush are concerned, all in a little bundle weighing between one and two pounds.

With an outfit as indicated above, two men can start off with four or five weeks' grub and have the whole outfit made up into canoe and three bundles of 75 to 85 lbs. each. This means two trips on the portages until most of the grub is eaten, unless the man with the canoe can take a little load besides, and the other man stiffens up his neck so that he can carry a good heavy pack on his tump-line.

For portaging, the tump-line is far better than anything else, and it pays the novice to endure for a few days the sufferings from a squashed neck rather than to be forever tied down to shoulder-straps. The tump-line is very easily changed from one pack to another, and it is easy to get the pack in position on your back. If you stumble you don't need to wear yourself out trying to get up again without disengaging those much-qualified straps; and if you fall into a creek you are not drowned; for the tump-line drops off automatically as you fall.

If our two men are wise, they won't waste much time in the immediate vicinity of Porcupine this spring. They may go there for a few days to study the occurrence of the gold-bearing quartz; then they will strike off into the bush, outside of the winter-staked area, and travel from one small lake to another, either using the little streams to guide them or following an overland course by compass. It is necessary for them to pitch camp on a stream or lake sufficiently large or well marked to be sure of finding it again if they intend to wander far from it. They will take a look at whatever exposures of rock they see. If it is intrusive granite, they may keep an eye open for tinstone. If the post-Huronian diabase intrudes, they may hope for silver. If the old Keewatin rocks appear, gold quartz, magnetite and hosts of other minerals may reasonably be expected. By means of associations of this sort the man who has studied the occurrence of ore bodies can save a lot of time and energy; he won't search crevices in a big patch of even-grained granite for a cobalt-silver vein, nor will he climb along the face of a big diabase cliff prepared to find a mica deposit.

Our men will probably meet few others, if they are in a good place; for, as noticed before, it is sad but true that most so-called prospectors prefer to ornament the banks of the rivers and lakes used as highways, or to add to the populations of the numberless little "rush" camps, rather than do patient, persevering, independent work, the kind that will give the best results in the long run.

The recent conclusion that all boiler corrosion is a result of galvanic action is being questioned, and another cause has been brought to the notice of the Society of Chemical Industry by K. N. Huntley. In this case sulphur appears to have produced the pitting of a boiler. Increase in the caustic soda used had no effect, and the water was slightly alkaline, but blisters formed —especially near the water-line—proved to contain ferrous sulphate with a slight excess of sulphuric acid. The investigation has suggested an explanation of the curious acid corrosion in alkaline water. The sulphur contained in the water seems to be first oxidized to sulphuric acid, and this attacks the metal about it, depositing oxides that form a membrane permeable to oxygen, but not to alkali. Thus the acid continues its work of corrosion, while protected against neutralization by a shield of its own construction.

OUR EUROPEAN LETTER.

Coal-cutting Machines in Scotch Collieries—A New Electrically-driven Cutter—Internal Combustion Engines for Haulage Work in Mines—Tardy Use in England—Experts' papers at Institution of Mining and Metallurgy—Vacuum Process in Cornish Tin Mines—Belgian Limitation of Coal Miners' Hours.

Exclusive Correspondence of the Canadian Mining Journal.

London, February 17th, 1910.

Mining engineers are continually urging coal-cutting machines upon our colliery owners. In a number of Scottish collieries working the long-wall system of mining such machines are now working on an inclination of 27 degrees, cutting uphill and downhill for 390 feet per shift. These machines on the Continent are working on even steeper seams. I would like to see British colliery owners go in for a larger number of coal-cutting machines, as therein is believed to lie the remedy of the Eight Hours Act. The output of coal is increased by fewer men at a lower cost.

A new machine on the market is the Simplex Bar coal-cutting machine, electrically driven and built at Wolverhampton. In this the cutter-bar is coupled direct to the motor shaft without gearing, and the machine can cut both ways without alteration in the position of a main frame. By tilting the machine a cut can be made practically at floor level, while by raising it on elevated brackets, which are made in various sizes, the type which has its motor suspended below the frame can work at heights up to 2 feet 6 inches, while that in which the motor is above the frame can be used up to a height of 5 feet or even 6 feet in certain cases.

The absence of gear wheels gives increased mechanical efficiency with reduction of current consumed and a saving in maintenance charges. The machine is advanced to a new face in a few minutes by means of a simple arrangement, which consists of four special axle pins formed on the elevating slides at right angles to the ordinary rail-wheel pins. The elevating slides are raised one by one by means of the screws, and the rail-wheels are then changed onto the special axle-pins. When all four wheels have thus been changed, the complete machine is moved along cross rails until it is in position for cutting the newly exposed wall of coal. The cutting-bar is of best forged wrought-iron, and the cutters are pick-shaped, with shanks tapered to correspond with the holes, so as to fit tightly when driven in. The electric equipment consists of motor, control switch, resistance and interconnecting cables.

The use of internal combustion engines for haulage work in mines is very slow in maturing here, and it has been left to various mining companies in Germany and Austria to give the lead. There has been just placed on the market here the New Century internal combustion locomotive, and its producers have endeavoured to give it all the features that are desirable for mining service. I refer to such things as compactness, small wheel base, and the property of being apparently safe when used in gaseous mines. These locomotives can be secured in various sizes ranging from 6 to 30 h.p., with one, two, or three speeds, according to requirements.

The makers direct attention to the fact that the centre of gravity of the motor is lower than is possible with a vertical engine, a point of considerable importance when the gauge is narrow and has curves of 15 ft. radius. The engine works on the ordinary Otto cycle, and its fuel may be petrol, benzine, or benzol, the latter being a coal tar product and even cheaper than tar, and hence the reason for its use in a number of mines. Against the use of benzol, however, are the disadvantages that the combustion is not so complete as that obtained with benzine or petrol, and it is also liable to attack the cylinder walls and valve seats.

Low-tension magneto ignition is fitted, and a feature worthy of note about this is that the circuit is not earthed, as is customary on motor cars. The return path to the magneto is provided by means of a separate insulated lead. This arrangement has been adopted in order to comply with the new Austrian Mining Regulations, since the locomotive is being used extensively in that country. The cables are metal woven on the outside, thus reducing the chances of fraying to a minimum. The engine has no carburetter; the petrol, after having passed through a filter, has free access to the inlet valve, a jet of petrol and another of water and the requisite supply of air being introduced into the cylinder. The incoming air mixes with the petrol vapour inside the cylinder, after passing through a double-gauze chamber, which, it is claimed, ensures a perfect mixture and also prevents any flame passing into the inlet pipe.

The double-gauze chamber is fixed to the inlet valve, and moves with it. The injection of water naturally assists in cooling the cylinder. The cooling water in the jacket circulates on the thermo-syphon system. Water is also ejected from the lower face of the exhaust valve, in order to keep the latter cool and also to condense the exhaust gases. This arrangement, it is claimed, renders it impossible for any flame to pass into the exhaust box. As an additional precaution wire gauze is placed in the latter.

With regard to the method of transmitting the power from the engine to the driving wheels, on each of the parallel shafts at the extreme right there is a chain pinion which can be set free or caused to revolve with the shafts by means of a clutch. A Renolds driving chain passes over these in opposite directions, and also over the sprockets on the axles. Forward and backward movements of the locomotive are obtained by clutching in either the top or bottom pinion. This form of transmission, it is claimed, is both efficient and reliable. The transmission shafts are on the same frame as the main engine. Sanding boxes are provided, and they can be operated from the cab in the usual manner.

On account of the special arrangements above referred to, a 12 horsepower locomotive of this type has a total length of only 12 ft. 6 in., a height of 4 ft. 9 in., and a width of about 3 ft., which enables it to be used in the narrowest and lowest mine roads. As regards fuel consumption I am informed that this has been found to be about two-thirds of a pint per horsepower hour at full load. It has been found from practical experience that a 12 horsepower locomotive working at its full output only uses five gallons of fuel on a ten-hour shift. It is claimed that this form of haulage, when everything is taken into account, such as maintenance, interest and capital, and so forth, has proved to be from 30 to 50 per cent. cheaper than horse haulage.

Interesting papers were read at the last meeting of the Institution of Mining and Metallurgy here. A. T. French reviewed in his paper on "Copper Blast Fur-

nace Slags and the Determination of Their Melting Points'' the work on record which has been done with double and ternary silicates recently, and augmented these by the results of his investigations with slags made in the actual practice of copper smelting. The determinations of the melting points were accomplished by comparison with a series of Seger cones of standard melting temperatures, and from tables quoted it appeared that the slag of highest melting point contained least silica and highest alumina of the series, whilst another with least alumina was the most fusible. The ''oxygen-ration'' was shown to be a valuable factor in considering the slag to be aimed at, and debating the part played by alumina, the author considered there was a fairly wide range through which the slag composition might vary, with very little change occurring in the melting point.

Arthur R. Andrew contributed in a paper on ''The Detection of Minute Traces of Gold in Country Rock'' the results of his research for a reliable method of determining the presence of gold in the shales and greenstones of the auriferous district of Merionethshire, North Wales. The usual method includes the use of large charges and the measurement of the gold bed got by a powerful microscope, which can detect as little as .0007 grain of gold per ton. The chief point of difficulty was in obtaining fluxes of sufficient purity, and he in particular found that the litharge on reduction when fused with soda and borax often yielded as much gold as the stone was supposed to contain. The result of his working after repeated failures to purify the lead led him to doubt the present possibility of getting any salt of lead so free from gold and silver as to warrant its use in the assay of country rock.

An interesting process in operation upon the famous Dolcoath tin mine of Cornwall is the Elmore vacuum process. In certain parts of the mine the ordinary tin ore of Cornwall is found, but impregnated with varying proportions of sulphides, principally copper. This ore is crushed in the usual crushing stamp battery and then passed to one unit of Elmore plant. Almost the whole of the sulphides are floated out and recovered as a high-grade copper concentrate, saleable as such.

This copper concentrate contains a remarkably small proportion of tin, probably not more than two or three pounds per ton of concentrates on the average. Subsequently the whole of the tin oxide is left in the tailings from the Elmore plant. These tailings are afterwards treated by Frue vanners, etc., in the ordinary way for the recovery of the tin oxide. Many mines in other parts of the world contain ore similar to the Dolcoath, so that the process will probably soon extend beyond England.

The recent adoption by the Belgian Senate of the law limiting the hours of work in coal mines to nine a day, counting from the time when the first men of a gang go down to the time when the first men of the same gang come up to the surface again, has considerably altered the technical conditions of the work in the pits, and an extended use of machinery will be necessary to compensate for the loss of effective work by the men.

At present more than 50 per cent. of the companies have no underground power, except for the emptying of the trucks. But the new law changes the aspect of affairs, and for several companies the adoption of mechanical appliances will be a matter of life or death. The solution of the problem will be difficult. Existing types of machines are mostly designed for use in rich seams on a large scale, but in Belgium the coal mining industry is divided up between a large number of little independent concerns, whose capital is small and whose resources do not permit of large expenditure.

Moreover, the nature and composition of the seams are not favourable to the employment of machinery. Their formation is peculiar in that they are split and wrinkled everywhere—here almost flat, there sloping steeply, as if they had been subjected to a series of powerful pushes. These folds and wrinkles are most numerous in the southern portions of the coal-bearing area, but, while they are still well marked in the centre, they become less noticeable towards the north, in the low parts of the country. These conditions present obstacles to the utilization of coal-cutting machines which in that part of the Belgian coal-field known as the Couchant de Mons will be impracticable on account of the twisted and crooked character of the deposits.

In a report on the technical consequences of the loss of one or two working hours imposed by the law, a leading mining engineer, Mr. Denoel, states that it will be impossible to avoid a falling off in the production in regions where the miners work exclusively on poor, thin, or difficult seams, and that the only remedy for the blow which the new legislation strikes at the mining industry is amalgamation in order to secure more efficient working. The only hope for some of the smaller concerns is absorption by the larger, as it will be impossible for them to stand alone.

LEGAL COLUMN.

On Selling Mining Stock at a Discount.

Ontario is the only Province of the Dominion in which mining companies are in a class by themselves, free from one vulgar bond that fetters ordinary commercial companies. Ontario mining companies are the only companies of Canadian origin that enjoy the right of issuing shares at a discount. This boon is created by Sections 139 and 140 of the Ontario Companies Act:

> ''S. 139. A mining company heretofore incorporated or hereinafter incorporated under this Act and made by the Letters Patent subject to the provisions of this part of the Act, may issue its shares at a discount or at any other rate in the manner herein provided.
>
> ''S. 140. No shareholder of such company holding shares issued as herein provided shall be personally liable for nonpayment of any calls made upon his shares beyond the amount agreed to be paid therefor.''

This provision first appeared in a Mines Act passed in 1894. I have not discovered where the Legislature of 1894 got the idea.

Mining companies of Ontario also have the right in the event of a purchaser making default in calls on stock of selling such stock at public auctions to the highest bidder for cash (S. 144).

One may be permitted to wonder just how advisable this legislation is.

It is laid down very clearly in England that companies there cannot issue their stock at a discount. The leading case on the subject in the House of Lords is, by coincidence, regarding a mining company, the Ooregum Gold Mining Company of India, Limited, vs. Roper, 1892 Appeal Cases, p. 125. There Lord Halsbury said: ''I think that the question which your Lordships have to solve is one which may be answered by reference to an inquiry: What is the nature of an agreement to take a share in a limited company? And that question may be answered by saying that it is an agreement to

pay the company the amount for which the share has been created. That agreement is one which the company itself has no authority to alter or qualify, and I am therefore of opinion that the company were prohibited by law from doing that which is compendiously described as issuing shares at a discount."

And this is the general law regarding all companies, except Ontario Mining Companies. Applying this principle, it has been held that the issue of stock at a bonus is illegal, or the issue at a discount of debentures which contain the provision allowing them to be exchanged for stock. (The one exception to this principle is the provision under which payment for shares may be made otherwise than by cash—for services or for the assets or good-will of an existing business. To this, reference will be made again.) The principle of the Ontario law, except for mining companies, is shown in the memorandum of agreement required to be signed by the original shareholders of the company, "And we do hereby severally and not one for the other subscribe for and agree to take the respective amounts of the capital stock of the said company set opposite our respective names as hereunder and hereafter written, and to become shareholders in such company to the said amounts."

A fundamental principle of the law is violated by the privilege of issuing shares at a discount. The capital stock of an industrial company indicates, or is supposed to indicate, the value of the assets of the company. In a mining company it has no significance whatever. The very word "Limited" itself was hit upon to indicate that the liability of shareholders was limited by the amount of the stock subscribed. For our mining companies we should change this phrase to "Obliterated."

A share at a discount is a legalized illusion. Selling shares at a discount is the old coin trick where you put three coins on the table, make a few mystic passes, turn over the coins and announce that there are now four coins. The other fellow says there are only three. "Oh, indeed," you say. "Well, I'll bet you the odd coin that I'm wrong." So he bets, and then there are four coins, for of course you're wrong.

Seriously, what possible advantage can there be in this privilege, except the gulling of the public? Presumably, the argument is, that mining stocks are a gamble anyhow, and couldn't be sold at par. That was the argument in the Ooregum case above cited. The company's 20 shilling shares were selling in the market at 2s 6d, and the new stock was issued at 5s fully paid, with a 10 per cent. preference. It was argued that no one would pay 20s for a stock selling at two and six. But the judges pointed out that the same result could be obtained by selling the shares at 20s. with a 40 per cent. preference. There is not a single problem apparently solved by the discount method that cannot be really solved without it. For it is simply a question of arithmetic. As said before, a share at a discount is an illusion. A share is not so much money. It is a thousandth—or whatever fraction you choose—share in the company's assets. If the set assets are $500, the share is worth 50 cents; if they are $100,000, the share is worth $100.

A share at a discount is an illusion. An illusion is something that deceives. We are all deceived. The stock of the Oleaginous Mining Company (capital $1,000,000) is offered this week at 50 cents, positively going to 60 cents next week, and 75 cents the 1st of April, and we buy, thinking we are getting a dollar's worth at half price. If the capital were $500,000 and were offered at par, next week 20 per cent. premium, next month 50 per cent. premium, we wouldn't think of buying unless it were a bank or a golf club—the mirrors are down and you see through the maze.

Here, I am confident, is a source of more evil than is prevented by prospectuses and licenses to do business and annual summaries and the other complicated paraphernalia of the Companies Act, themselves a maze. Here is a chance to simplify and improve at the same time.

THE LEONARD PRIZE.

The committee selected to award the Leonard Prize of $100 for the best collection of Ontario minerals has decided that the collection sent in by Mr. Frederick Ransom, B.Sc., of Deloro, Ont., is worthy of the prize.

Three collections were submitted, the winning one, collected largely in Eastern Ontario, the second collected from the region north of North Bay, and the third from the Lake Superior region.

Owing to the limitations in connection with the competition, viz., that the specimens must have been personally collected in Ontario during the year 1909 by the competitor, the collections were necessarily restricted in the number of specimens.

The members of the committee congratulate Mr. Ransom on the superiority of his collection.

RICHARDS.

Ore dressing is a big field. When one begins to consider the details of its varied ramifications it appears a vast region. The beaten paths are few and by most mining engineers they are trodden in haste.

We have had with us a pioneer who not only has explored and mapped new routes, but who has shown us very much that we had overlooked along the beaten paths. Richards has conducted more experiments in ore dressing than any other man, he has written on the subject more, and he has devised and constructed a greater variety of ore dressing devices than any other man. He has devoted his life to the study and the teaching of dressing. He is the Master in research.

He came to discuss with us "Some Directions in Which Improvements in Concentration May be Looked For." For two hours he gave us in wonderful succinctness an outline of the beaten paths and of some of his new paths—two hours of preface, thought-clearing, idea-crystallizing, inspiring discord—and then we went to lunch without question or discussion. Too bad! But such is the tyranny of local conditions. And we were left with only such answers as we could find in the preface.

The meeting was an excellent one, good in many ways, possibly an epoch-marking occasion, but it would have been well worth while if we had had nothing but Richards, and it is to our disgrace that we did not reap to the full the benefits to be bestowed. L'embarras de richesse—there were too many good things—we could not take care of them—we must remodel our methods for the future.

His books are good, are enduring monuments, and truly show the work and the research of the man, but Richards himself is a different proposition. He is

greater than his books. He inspires. His personality compels and it is delightful. His earnestness, his modesty, his enthusiasm, his thoroughness, his originality, his outspoken delight in his results which he describes so impersonally as "gift from the gods"—these explain somewhat the control over students and assistants that has compelled to long, tedious, wearisome gathering of data. It is hard to tell what his chief monument will be. By manner, by method, by activities, he is still young, really only on the start of his pioneer work. It may be, it promises to be, that his name will be to the ordinary millman as Wilfley or Frue (and such is their position that we almost spell them without capitals). Up to the present he is more known to the student, and his guiding work has been in his methods of research. His milling devices are the product of cold, calculating analysis. They have not yet clinched themselves into the every-day mill design, as have Wilfley's, but they are getting there.

What were the answers to the question in the title of his paper?

One doubtless was—"In the perfection and the adoption of linderal settling classifiers." What are the other answers? It is our misfortune that time did not permit of these answers. May we hope to have them embodied in complete printed form at an early date.

Is the question an important one? Is there room for much improvement? The room for improvement appears in the losses incurred in ore dressing operations. Richards did not tell us to what they amounted. In most cases—in almost all cases on this continent outside of Cobalt—the losses in the mill are greater than the dividends of the company. In no part of the operations of the company is there greater room for improvement. The room for improvement is represented by more than a hundred million of dollars annually poured into creeks and rivers and lakes in the form of ore that has been mined, and transported and crushed and treated and thrown away. The room for improvement is great, the need of the man is great. That Richards inspires others to work with him may be not the least of his characteristics.

H. E. T. HAULTAIN.

A PROCESS FOR SMELTING NICKEL-COBALT-SILVER-ARSENIC ORES.

For smelting ores carrying from 300 to 10,000 ounces of silver per ton, 10 to 30 per cent. nickel and cobalt, and 3 to 40 per cent. arsenic, Mr. C. C. Cito, Irvington, N.Y., has patented a process. A percentage of copper, not less in total amount than the silver contained in the ore, and equal to two-thirds of the nickel and cobalt, and, further, not less than the amount of arsenic, is added to the ore. On smelting, a copper alloy is obtained, containing all the silver, nickel, and cobalt, and nearly all the arsenic. The slag contains very small amounts of silver, nickel, and cobalt. The alloy is next separated by electrolysis, and the slag is used as flux in the furnace.

Calcium cyanamide, the new artificial "lime saltpetre," has serious drawbacks in its causticity and the emission of ammonia and hydrocyanic vapours. An Italian method of making it inoffensive consists in making it slightly acid with dilute sulphuric acid, then drying and pulverizing.

AN ARGUMENTATIVE OUTFIT.

By John Ravenor Bullen.

I will tell you a tale of an outfit
That drilled fer old Giggle McGree;
A gang as consisted of "Jail John,"
"Knock-'em-down Jimmy" and me;
Three of the all-firedest experts
That ever took swigs of cold tea!
Three of the ding-dangedest drillers
As never could ever agree.

We was plunking her down fer old Giggle,
And things was a-going quite slick.
The last as we said to old Giggle
Was, "Week more'll finish the trick."
Last words as we heard from old Giggle
Was, "Boys, but that's drilling her quick."
And then he druv home, did old Giggle,
To his farm in the township of Zick.

Now "Jail John" was up in the scaffold
Whistling a "Glory Be" song;
And "Knock'em-down Jimmy" was stoking,
Coaxing the engine along;
While I was a-blowing the bellows,
Heating a weld that went wrong,
When there started the all-firedest mix-up
That ever I joined in among.

'Twas "Jail John," he comed down the ladder
And started in telling a tale
Of the time that he helped drill a duster
In the yard of Coop-'em-'up Jail;
When they struck—a big flowing bonanza?—
Well, no, 'twas a showing of shale;
And about as much oil in the sand-pump
As 'ud pay for a tenpenny nail.

Well, I never knowed how the thing started,
Or who 'twas as said 'twas a lie,
But inside a couple of minutes
John biffed me a bang in the eye.
Then the things in that little old shanty
Growed wings, and just started to fly.
Oh, you bet we was elegant fighters
When we once fixed our minds fer to try.

'Twas a week that the fight must have lasted,
And that I will swear by old Nick;
For we still was a-fighting ferocious
When there comed from the township of Zick
The man we was plunking her down fer,
Old "Boys-but-that's-drilling-her-quick,"
And he looked at the ruins around him,
And he said: "Gosh, that's finished the trick!"

And that is the tale of the outfit
That drilled fer old Giggle McGree;
The gay gang consisting of "Jail John,"
"Knock-'em-down Jimmy" and me;
Three of the all-firedest experts
That ever took swigs of cold tea!
Three of the dingdangedest drillers
As never could ever egree.

PERSONAL AND GENERAL.

Mr. G. L. Fraser, formerly of Phoenix, who opened up and operated the International Coal & Coke Co.'s property at Coleman, Alberta, has been engaged as manager by the Columbia Coal & Coke Co., which recently acquired the coal deposits stretching from Granite Creek to Coleman's Gulch. He is accompanied by Mr. W. G. Norrie, who served with him at the International and was later engaged as engineer by the McGilvray Creek Coal & Coke Co. The work of developing the property into a productive mine will be pushed forward with all possible speed, inasmuch as Granite Creek will soon have railway connection with Princeton and the Boundary country.

Mr. S. S. Rosenstamm has been elected a director of the Kerr Lake Mining Co., and also of the Wettlaufer Co., both Lewissohn enterprises.

The Cobalt branch of the Canadian Mining Institute has elected officers for 1910 as follows: Mr. T. R. Jones, Chairman; Mr. A. A. Cole, Secretary; Messrs. J. E. Leckie, C. O'Connell, H. Park, C. Campbell and John Macdonald, Committee.

Mr. W. J. Loring, of Messrs. Bewick, Moreing & Co., has just left London for a visit to the properties of the Burma Mines, after which he will proceed to Australia for a tour of the numerous mines in that continent in which his firm is interested.

BOOK REVIEWS.

A Text-Book of Ore Dressing. By Robert R. Richards, S.B., LL.D., assisted by Earl S. Bardwell and Edwin G. Goodwin. In one volume. Illustrated profusely with diagrams and half-tones. 702 pages. Price $5.00. McGraw-Hill Book Company, New York, 1909.

One of the most serious criticisms that can be made of Professor Richard's four volumes on ore dressing is that they are bulky—too bulky for use outside the library. Of course, it is scarcely possible to have them otherwise. But we welcome the compact volume before us. It embraces all the essentials of the four older books, and has the advantage of conforming to the size and character of the ordinary text-book.

A new and profitable chapter on coal dressing has been added. This is distinctly a gain.

The actual work of condensing was done by Messrs. Bardwell and Goodwin.

Professor Richards' Canadian admirers will find this compendium just what they need.

The Chemistry of Cyanide Solutions Resulting from the Treatment of Ores.. By J. E. Clennell, B.Sc.(Lond.). Second Edition, corrected and enlarged. Price $2.50. McGraw-Hlil Book Company, New York, 1910.

Modern laboratory tests for determining the constituents of cyanide solutions are fully described and discussed in this treatise. The second edition, just off the press, is brought up to date and former omissions and inaccuracies are rectified.

In view of the growing importance of cyanidation, Mr. Clennell's book calls for renewed notice. A synopsis of its contents will best serve to shew the reader the ground covered.

In the order named, the following subjects are taken up:—

1. Active Cyanogen Compounds.
2. Alkaline Constituents.
3. Reducing Agents.
4. Auxiliary Agents.
5. Inactive Bodies.
6. Noble Metals.
7. Base Metals.
8. Suspended matter.
9. An Examination of Various Methods for the estimation of Ferrocyanide.

Lengthy appendices are subjoined. These treat of alternative methods of estimating free cyanide, protective alkali, etc.

As a laboratory guide for the competent chemist the "Chemistry of Cyanide Solutions" is indispensable. The writer's object has been to meet all probable combinations of circumstances. A cursory perusal of the book gives one the impression that the cyanide chemist is not likely to run up against any working complications for which he cannot find here a key.

EXCHANGES.

Metallurgical and Chemical Engineering, March, 1910.—Our contemporary gives Connellsville coke operators a sound scolding. After accusing them of entire ignorance of the developments in retort coking and the use of the by-products, it goes on to tell of their disastrous attempt to keep prices up.

Last September the price of furnace coke was pushed up to $3 per net ton at the ovens. Now prices have tumbled and much stock is accumulating. "The pushing of the price to $3 merely on the supposition that blast furnaces would have to pay the price or not make pig iron, was a command to the industry to seek other fuel. When another fuel has been found, the customer does not return to Connellsville. . . . They [the producers] have failed utterly to realize that the day of by-product coking is fully arrived. . . . They are killing their own business and writing an enormous depreciation upon their coal reserves."

The Engineering and Mining Journal, January 29, 1910.—To this number Mr. E. M. Weston contributes the second of a series of articles entitled "Analysis of Mine and Mill Practice on the Rand." Mr. Weston refers to the Holman pneumatic stamp as the only serious competitor of the gravity stamp on the Rand to-day. One Holman stamp is crushing 80 tons per day. Its total cost of installation is said to be half that of ten gravity stamps.

ELECTROLYTIC AMALGAMATION.

A recent patent covers the electrolytic amalgamation of finely divided gold. The apparatus is essentially a sluice box whose bottom is a continuous amalgamating plate, with pockets occurring at intervals. Amalgamating plates extending across the sluice box are anodes. Swinging carbon anodes are also supplied. The bottom plate is the cathode. The finely divided ore is fed in with a suitable quantity of water along with small amounts of solutions of potassium cyanide and mercuric chloride. It is claimed that savings of 95 per cent. can be made, and that the process is decidedly cheaper than cyanide treatment.

The ruling New York price for iron pyrites is from 12¼ to 12½ cents per unit, according to point of delivery.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay.—The output from the mines of the Dominion Coal Company during February was approximately 200,000 tons, which is practically the same as obtained last February. Towards the end of the month the output improved in an encouraging manner, and for several days together exceeded 10,000 tons.

At the time of writing, a very commendable effort is being made by the clergymen of the mining districts to bring about a cessation of the useless struggle which has been going on here since last July, and an appeal is being made to the men on strike to return to work. Whether the well-meant efforts of these reverend gentlemen will bring about this much to be desired event is not at the moment possible to forecast, but there is a decided optimism in evidence in this regard. The strike has been a huge mistake. It was called with a wanton disregard of the probabilities, and it has never been effective. In an open letter written by president Plummer to Mr. T. L. Lewis, the president of the United Mine Workers, Mr. Plummer states that the conditions of work at the mines of the coal company "are in any case, acceptable to the large number of men who are now at work, and they are the outcome of years of experience and negotiation." With reference to a return of the strikers to their work, Mr. Plummer writes: "I can only suggest that when a line of action has been adopted which is found to be mistaken, the really honourable way is to begin afresh." Many of the strikers are taking Mr. Plummer's advice, and the number of men at work is steadily augmenting, as the increased outputs show.

Just at the moment when the counsels of peace and prudence are beginning to be listened to around the mining towns, it is a little unfortunate that Prof. McGill—if he is correctly reported—should have seen fit to strike a jarring note. The Montreal Star has the following: "They told us to go to the Devil," said Prof. McGill, speaking of the treatment the Nova Scotian Royal Commission received at the hands of many employers, who were against all kinds of state interference on matters of hours, etc. There is at least one large corporation in Nova Scotia, and we could name many others also, at whose hands Prof. McGill received nothing but courtesy and reasonableness. The coal-owners of the British Isles, and the coal miners also, could say a few things about the effects of state interference in the matter of hours, etc. The aftermath of the Eight Hours Bill for Mines in England is proving more menacing than even the strongest opponents of the bill dared to prophesy. At the very moment when trade is showing a decided revival, the British coal exporters are being hindered and embarrassed. The "Colliery Guardian" in an article on the "Folly of the Eight Hours Act," summarizes the result of this Act so far, as a "reduction in output, a rise in prices, and an impairment of competitive power abroad." German and American coal is being sold as a result of this Act in markets which were regarded as belonging to South Wales; the Rhenish-Westphalian Syndicate is raising its tonnages, English exporters are losing ground in France and the Mediterranean, and, to again quote the "Colliery Guardian," "all these troubles coming on the brink of what appears to be a genuine revival in trade, must accelerate all the miseries and difficulties that are the undoubted offspring of this Act." This indictment, coming from the recognized mouthpiece of the English coal trade cannot be lightly esteemed, and it is not to be wondered that Nova Scotian coal operators do not always receive with open arms the gentlemen who propose "state interference in matters relating to hours, etc." Prof. McGill is also stated to have said that "amazing ignorance of the industrial problems of the day, prevailed among the employers he had met." Such sweeping indictments of our Nova Scotian industrialism are unfair and ill-considered, because, actually, the condition of the working classes of Nova Scotia is infinitely better than in the large industrial centres of the United States and the Old World, and nowhere perhaps in the globe, can one find so many workingmen who own their own freeholds and have money in the savings bank, or who are so democratically independent as the men of Nova Scotia. A great many of the captains of Nova Scotian industry are men of the people, risen from the ranks of the "common people," and instinct with the sympathies of their origin, and there is no reason why they and their workmen cannot work harmoniously together. Prof. McGill sees the greatest industrial conflict that Eastern Canada has yet witnessed, looming ahead. If Nova Scotians would, for a little period refrain from "knocking" their own province and their own industries, and would concentrate their energies on the advancement of these same, there is in view the greatest industrial development that Eastern Canada has yet seen.

EAST VS. WEST.

Recently a party of German and Belgian miners were refused entrance into Canada through the port of Halifax because they did not possess the sum of $25.00 in cash. These men were all physically fit experienced miners, holding a through ticket to their destination, possessed of baggage and sums of money up to ten dollars per man. They were held in the Detension Hospital in Halifax for deportation by the next available steamer. In the meantime, however, application was made for writs of habeas corpus, and an order was granted by the Courts releasing these men, who thereupon proceeded to their destination in Cape Breton. Every man had a guarantee of work and possessed the qualifications which should admit any emigrant into Canada, namely ability to work, freedom from disease and an industry requiring his services. Had these men been farm labourers, they would have been allowed to proceed, but being merely miners, it was not thought the country had need of them. The farming industry of Canada and the needs of the Great West are being insisted upon a little too monotonously to please the people of Nova Scotia. That the whole emigration policy of the Government should be framed from the Western and Upper Canadian standpoint is distinctly unfair to Nova Scotia. Happenings of this kind but serve to further show the desirability of adequate representation of our mining industries in Canada. The coal mining industry of the Dominion is but in the first stages of infancy. The number of men now employed in coal mining is barely adequate for present needs. The present generation of miners are not bringing up their sons to work in the pit, and the only possible source of supply is from Europe, because the United States mines are in a similar position to those of Canada. There are many reasons why a strict supervision should be kept over immigrants intended to work in the mines. Such diseases as miners' opthalmia, ankylostomiasis, and various other parasitical diseases incidental to European coal-mining, should not be allowed to gain a footing in Canada. But the possession of a set sum of money is not the true basis of qualification for fitness to enter the Dominion. If free from disease, the experienced coal miner should be welcomed to Canada, because he is needed quite as much as the farm-labourer. We are probably correct in saying that when the West asks for coal miners they will get them. It is a little strange that the agents of Nova Scotia should flood the British Isles with alluring prospects for the agriculturist, and apparently forget the mining industry from which it gathers the bulk of its revenue.

At the February term of the Supreme Court in Sydney, some heavy sentences were meted out to strikers who have disturbed

the peace in the mining districts. Seven men were given two-year terms in the penitentiary, and some thirty others were fined sums varying from $20.00 to $30.00, with the option of from one to three months in jail. The aggregate fines of these men amounted to one thousand dollars. The offences mostly arose out of the intimidatory tactics which have been followed by the U. M. W. leaders, the charges being such as assault, unlawful assembly, etc. The foolish men on whom the punishment was inflicted thought that the great and powerful U. M. W. would pay the fines and save them from imprisonment. However, this was not done, and the offenders will be required to serve their jail terms. When the late Vice-President of the U. M. W., Mr. E. S. McCullough, was exhorting the miners during the summer to stay out on strike, he published a letter in the local newspapers in which he set forth the enormous resources of the American union, and stated that they could without difficulty raise from six to eight million dollars, and that every cent of this sum would be used, if necessary, to fight the battles of the U. M. W. in Nova Scotia. The men who are now serving their terms in prison will have time to reflect on the hollowness of Mr. McCollough's promises, but there is a glaring injustice about the law which allows the originators of the Glace Bay trouble to go free while their tools and dupes suffer for the things to which the leaders incited them. Just before the recent municipal elections in Glace Bay many of the strikers were saved from disfranchisement by the action of the U. M. W. in paying their poll taxes but when the last strike pittance was doled out, the strikers found that 25c of the regulation $2.00 per week had been deducted, leaving them with the meagre sum of $1.75 with which to face the necessities of the winter. Ever since the beginning of last year, various officers of the U. M. W. have been living at the Glace Bay Hotel, faring on the best that the town affords. And yet the irony of the situation does not appear to have been appreciated by the dupes of these men. It has been an interesting study to watch the issuing of the successive lies by which the courage of the strikers has been maintained. As fast as the untruthfulness of one false report has become apparent, another fabrication has been set afloat and one must really give the U. M. W. credit for a considerable ingenuity in this regard.

In the March number of McClure's Magazine is a sympathetic account of the Cherry Mine disaster, by Edith Wyatt, illustrated by photographs which convey to the mind much more vividly than the printed word the mingled heroism and horror of these too often repeated catastrophies. Miss Wyatt refers to the ozygen breathing apparatus which were used, and remarks: "A man wearing one of these helmets with their great tanks and impedimenta, is said to have about one-eighth of his strength left for other purposes." The article is so lucidly written from a non-technical standpoint, that we would not wish to be censorious, but the statement is hardly a correct one. The oxygen apparatus unfortunately does weigh more than is pleasant, but trained men can do a great deal of work with them. Indeed the amount of physical exertion which can be accomplished while wearing these apparatus is remarkable, and can only be accounted for by taking into account the stimulating effect of the oxygen which is breathed. The article ends with a recapitulation of the appalling figures relating to the loss of human life in the coal mines of the United States, as compared with other countries, and a plea for a lessening of the swollen roll of fatal accidents in the mines of the United States.

ONTARIO.

[Editor's Note.—We cannot concur with our correspondent as to the satisfactory character of the Temiskaming annual meeting. Discounting the future by paying unearned dividends out of capital is inexcusably bad business.]

Cobalt, Mar. 5, 1910.—At the annual meeting of the Temiskaming Mining Company held in Toronto a short time ago, the affairs of the company came in for a great deal of discussion. Complete explanations relative to the affairs of the company were demanded of the officials. The officials gave apparently satisfactory explanations to justify the management, showing that they had acted to the best of their judgment in the interests of the shareholders. The advisability of declaring the last dividend was fully gone into and the president gave a complete explanation of the reasons that led to its declaration. He also explained the falling off in revenue that necessitated an overdraft on the bank to pay the dividend. Although the financial statement showed a deficit of $97,000, the outlook for this year is considered very good. The manager estimates a profit from the concentrator amounting to $300,000 a year from the low grade ore; and he states that there is already enough low grade ore in sight to keep the mill running for four years. The charge that the directors of the company used their inside knowledge of the property to enable them to sell their stock before the break in prices, was also discussed, and was satisfactorily explained. Detailed information was given regarding the conditions on the lower levels of the mine, which are promising. The ore on the upper levels has, however, been disappointing, as the low grade has not been very continuous. The falling off of gross receipts is also stated to be partly due to the fact that it was considered advisable to block out ore preparatory to milling the regular veins, rather than to incur the expenditure of stoping operations to mill the comparatively small amount of high grade ore contained. The amount of high grade ore in sight is estimated at 220 tons, containing 660,000 ounces of silver. The milling ore reserves are estimated as follows:

	Tons.	Ounces of Silver.
Ore in sight	40,000	1,200,000
Ore in dump	34,000	1,438,000
	74,000	2,638,000

An important discovery was made a few days ago, when an additional round was taken out of the bottom of the main shaft. The shaft has been going down a quartz and calcite vein, which contained only milling values. The last round, however, threw out high grade ore. This ore was found at a depth of 425 feet and if the shoot is of any extent, it will have a most important bearing on the future of the property. This working is the second deepest in the camp. A station was cut at a depth of 400 feet and a cross-cut is being run to cut the No. 2 vein, which is expected to lie within twenty-five feet of the shaft.

Good reports continue to come from the Elk Lake district, where several promising properties are being systematically developed. The recent find of high grade ore on the 120-foot level of the Moosehorn, has shown the necessity for more extensive development, and as a consequence, an addition to the present plant to consist of a six-drill compressor and two 75-horsepower boilers has been decided on. The Lucky Godfrey has considerable high-grade ore on hand and a small shipment could be made at any time. The Boland Thompson has also considerable ore sacked, and it is understood will make a shipment shortly. The Hitchcock has found some silver and it is stated that the Elk Lake Cobalt and the Tee Arr have some ore sacked. The Tee Arr was formerly known as the Downey claim. The good winter roads that have been available this winter have aided materially in getting in supplies and machinery. Some good finds have also been made, and on the whole, the district is looking much better than it has for some time.

The Munro Power Company is now definitely promising power on or before the fifteenth of March. They will probably turn their machinery over in a few days, and it will take a day or two to tune it up. The company has made astonishing progress with its work, as it was only last June that it was started. As there was no railroad near their plant with the exception of the Cobalt substation, the progress made is even more astonishing. The installation of this plant represents one of the largest, if not

indeed the largest investment of capital in Northern Ontario. The entire system is practically duplicate throughout, and the chances for a shut-down through lack of power are reduced to a minimum. The electric power is generated on the Matabitchouan River from the falls of the same name. The power plant is distant twenty-four miles from Cobalt and at the latter place two substations have been built. In these substations large electrically driven compressors have been installed, with specially designed intercoolers and aftercoolers to reduce the moisture in the air to a minimum. The system has been installed with the greatest care throughout, and is expected to give excellent satisfaction. The cost of power will be materially reduced throughout the camp and many companies that are now lying idle will start work. Other companies such as the McKinley-Darragh, Nipissing and La Rose will largely increase their present equipment. The development work on the Lawson has been held back for months on account of lack of power and many other properties are in the same shape. It is expected that the Gillies limit will also be opened up to a greater extent than at present, and it is to be hoped for the future sales of the government, that more veins will be discovered than have been up to date. So far only one vein of any commercial importance has been discovered. This is the vein originally discovered on the Waldman property which was subsequently traced upon the Wyandote. There is one other vein, but it was traced from the Red Jacket, and can hardly be classed as distinctively belonging to the Gillies limit. The Waldman is now mining good ore from the east stope. In the top of the stope from the seventy-five foot level there is about seven inches of ore. There is also some ore in the west stope, but it is not as good as toward the east. The Wyandote has sunk its shaft over 100 feet, and is preparing to cross-cut to the vein which dipped from the shaft about eighteen feet below the surface. This property is equipped with a complete plant. On the Sagdola a contract has been let for a shaft 100 feet deep. Considerable work has been done on the O'Brien-Glidden property, on which a shaft was sunk on a vein showing some cobalt. A shaft has been sunk over 40 feet on the Rex Flynn property, and a small steam plant installed. A small steam plant is shortly to be installed on the Webb lot which is near the Red Jacket. A shaft is being sunk by hand on a promising lead. Work will also shortly be started on the old Ross lot, which is now incorporated in the Victor Silver Mines, Limited.

The annual report of the Cobalt Lake Mining Company shows a debit balance of $191,783.62; but during the past year a considerable quantity of high grade ore has been mined, and there is a good tonnage in sight. The manager's report states that during the past five months two new veins carrying native silver were discovered. From these veins two shipments have been made which returned to the company a profit of $40,737.38. The quantity of water that was coming into the workings decided the management to sink the winze to the 250-foot level, and drifting has been stopped until this work is finished. Test pits sunk on the veins about 100 feet apart showed the veins to be about six inches in width of high grade ore. Since the end of last July the total shipments amount to 133½ tons, which returned 111,597 ounces of silver. Three hundred tons of second-class ore were also treated in one of the custom concentrators which gave a profit of $3,696.03.

At the Colonial a winze is being sunk 50 feet below the tunnel level, which, when completed, will give a total depth of 240 feet. From this point drifts will be run on the veins and ore blocked out. At the present time the mill is being supplied by stoping above the tunnel level.

A new vein was discovered on the Hudson Bay some time ago that shows about two inches of high grade ore. All the veins that are produced in mining operations are treated in a jig and table, and so satisfactory are the results obtained, that the company has practically decided to erect a small concentrator in the spring. The ore can very easily be treated by concentration and there are about 10,000 tons at present on the dump and in the stopes. Some time ago a winze was sunk near the Nipissing boundary at the 200-foot level on a junction of the No. 2 and No. 3 veins, and when down 50 feet, a drift was run and some good values were picked up. This winze is now being continued and will be put down a total of 100 feet.

Good news still continues to come from Gowganda and the shipments that have already been made show a promising state of affairs. Up to date the Millerett Company, formerly known as the Blackburn, has shipped 94 tons, making 156 tons of high grade ore in all. Other cars will probably be despatched shortly, which will considerably augment the amount already shipped. One injustice under which the operating companies in that district labour lies in the fact that the Government exacts a royalty of fifty cents a cord for wood cut on their own property. Of course these properties are in the Timber Reserve, but, the conditions under which work is carried on are bad enough without this additional imposition.

A very important and far-reaching amendment to the Criminal Code, passed the Senate a short time ago. This amendment, which has been agitated for years, will assist materially in checking high-grading operations that have been so prevalent, particularly in Cobalt. It promises that, in the future when any person is found to have ore in his possession, he must account satisfactorily for it, or prove his right to the possession of the same. The amendment also provides that the ore must have a minimum value of seven cents a pound before any action can be taken. There have been several attempts in both the Provincial and Dominion Houses to frame a bill that would put an effectual stop to high-grading operations. There has always been opposition until the exposure of ore stealing in Cobalt, when public opinion was greatly changed. The passage of this bill was strongly advocated in this camp, a deputation having gone to Ottawa to urge its being passed.

Two more ore shoots have lately been opened upon the Crown Reserve on the 100-foot level. They were cut by a cross-cut from the Carson drift, and although narrow, contain high grade ore.

The South Lorrain Development Co. has let a contract for 200 feet of tunnel work on its property, which is situated near the Silver Centre, on the shore of Lake Temiskaming. Several promising veins showing cobalt with small assays of silver have been found on the surface, and these will be cut by the tunnel. Work will be started immediately.

At the present time the McKinley Darragh is probably treating the lowest grade ore of any mill in Cobalt, and at the lowest working costs. For the year 1909 the milling costs were $1.98½ per ton. The first few months of the year the mill had only started, and the cost was consequently higher. The latter part of the year it cost $1.62 per ton, while for the first month of 1910, the cost was only $1.48. It is estimated that when the addition to the mill is completed and running, the capacity of the mill will be increased by fifty per cent.

According to reports from Elk Lake free gold has been found in the vicinity of Fort Matachewan. This district was first staked last December, and since that time a number of outfits have gone in.

It is stated that a plant will shortly be ordered for the Wright and Forneri properties in the Porcupine, upon which some good gold showings have been made recently. There are nine claims in all and they lie just west of the boundary line of Whitney and Tisdale in Tisdale township. The plant for the Timmins is going in and in a short time will all be on the ground.

The annual report of the Otisse Mining Company shows that since work was started, a total of $86,730.37 has been spent. It has been demonstrated that the rich ore, such as was found on the surface, extends to greater depth, but unfortunately it is

very variable in quantity. The report states, however, that so far no ore of sufficient extent has been exposed to warrant stoping. The results obtained, however, are sufficiently favourable to warrant the company in continuing its operations to greater depth. Up to date, the aggregate of underground workings amounts to 1396 feet.

Some good ore has lately been found on the Bailey Cobalt, below the tunnel level. When the Cobalt Central had a lease on the Bailey, a large tonnage of milling ore was taken out, but since that time the latter company has done practically nothing. Operations will be started, however, on quite an extensive scale as soon as they get electric power to run their machinery. The shaft will be continued to a depth of 200 feet in an effort to reach the Huronian slates that have proved so productive on the Cobalt Central.

The Right of Way has declared another dividend of two per cent. on the new stock issue, payable the end of March. This company is now devoting all its energies to that part of its property which lies between the McKinley Darragh and the Silver Queen. A winze has been sunk 45 feet below the 175-foot level, and the vein shows a good width of ore. Another car of high grade ore will shortly be shipped.

In connection with the exposure of high-grading operations as they existed in Cobalt the Crown Reserve and other mines are bringing an action for the return of the money held by Dr. Wilkinson, being the balance on the payments of ore said to have been turned over to Dr. Wilkinson by the high-graders. The companies are also working hard to get the necessary evidence to obtain convictions for all those who were implicated in the stealing and disposal of ore.

The townsite lots that the Government has had surveyed in the Porcupine district are to be sold by tender. Tenders will be received up till March 15th. There are 571 lots, and the recorder's office and post office will probably be located there.

BRITISH COLUMBIA.

Rossland.—The developments of the past couple of weeks have made a marked improvement in the ore reserves of the property of the Consolidated M. & S. Co. of Canada, here. A new deposit of good shipping ore has been located on the ninth level of the War Eagle mine that it is thought may develop into an important shoot. Assays taken from this vein have given $35 per ton and over. Work on the eighth level has, it is thought, located the continuation of this vein, which would mean a large stoping area. Another strike of importance has been made on the third level of the Centre Star mine where a five-foot shoot has been opened up. Development work is now being carried on to open up the finds which were located with the diamond drill. The Centre Star group is shipping about 4500 tons of ore per week to Trail smelter and the outlook for the summer's work is bright.

The situation at the Le Roi Mine remains the same as for the past several months. Shipments of three or four hundred tons of select ore are being made per week to the Trail smelter and diamond drilling still goes on. It is said that the diamond drilling contract will be finished in ten days or two weeks, when no doubt the future plans of the company will be divulged.

The Le Roi 2, Ltd, still remains in the dividend-paying field and has now declared a dividend of two shillings per share, payable March 8th. The annual report of this concern for the year ending September 30th, 1909, shows a balance in favour of profit and loss of £49,384 2s. 11d., which is considered a very satisfactory showing. During the year the sum of £14,991 0s. 2d. was written off as depreciation on development, plant, etc., and £5,814 13s. 6d. on the Van Roi preference share account. Six shillings in dividends was paid during the year, free from income tax, which absorbed £37,700 and it has been recommended that £5,000 be added to the resere. During the reviewed period 48,421 tons of ore was mined, of which 29,874 was shipped to the Consolidated smelter at Trail. The average value of the mineral content proved to be $23.54. The mining cost per ton was $3.35; smelting, $5.70; making a total cost for mining, smelting, development, depreciation, etc., of $10.56, this figure being 29c. below the same cost for 1908. Thus a profit of $12.98 per ton is shown. Development work in the mine averaged $14.35 per ton, and 9,820 feet of diamond drilling was done, which cost $1.96 per foot. Over $267,500 was sent to the London office of the company as a result of the year's work. The outlook for 1910 is very good.

It is rumoured that the Blue Bird mine in the South belt will resume development work at an early date. The lessees of the Mayflower mine, also in the South belt, have opened up a new ledge on the hilltop above the old shaft. This ore assays about $47 per ton and it is the intention to begin small shipments within a few weeks.

The Boundary.—The British Columbia Copper Co., Ltd., made a very good record during 1909, when the shut-down and other draw-backs are taken into consideration. And even at that it is not necessary to consider those things in order to see the favourable side of the thing. During its fiscal year, ended Nov. 30th, 1909, this concern treated 373,336 tons of ore at its Greenwood smelter, making 6,325,000 lb. blister copper, 18,244 oz. gold and 64,234 oz. silver. The cost of making copper was 9.829 cents per lb, including all charges. It is shown that the profits for the period reviewed were $236,338, being $142,378 more than for the preceding year. An average of 13.08 cents per lb. was received for copper sold. The work of enlarging the smelter capacity so that the ore from the mines of the New Dominion Copper Co. may be freely treated at that plant, will shortly begin, and it is expected that the Rawhide mine of the Dominion Co. will be making preliminary shipments within a couple of weeks.

The Conciliation Board failed to reconcile affairs between the B. C. Copper Co. and its men, so that the matter still remains smouldering. A strike has been threatened, but it is the desire of all that trouble will be averted in this section, so that considerable pressure is being brought to bear to smooth matters over.

The Snowshoe mine of the Consolidated Co. quietly but steadily makes its weekly output of 4,500 to 5,000 tons of ore to Trail smelter.

The Granby Mines are being examined at the present moment by Dr. Sussman, of New York, and Mr. Wm. Yolen Williams, of Spokane, who is consulting engineer for the company. Mr. A. B. W. Hodges, the local manager, has resigned his position with the Granby Co. to take up work with a company in Peru, which has offered him the enticing figure of $50,000 per year. As to whether there will be a change in the policy of the Granby when Mr. Hodges leaves, it is doubtful, although some minor changes may be made by his successor, of course. The weekly shipments from the property are running from 26,000 to 28,000 tons and have been steady since the first of the year.

Vancouver.—The Ikeda Bay mine, on Moresby Island, of the Queen Charlotte group, has been taken over by a syndicate of Vancouver capitalists, closely related to the Nical Valley Coal & Coke Company, and of which J S. Castleman is the leading figure. It is understood that the bond is for $250,000 on which a couple of early payments have been made. Pursuant to a recent examination and report on the property by A. G. Larson, Superintendent, Le Roi mine, a campaign of diamond drilling will be started about the middle of March, and a sum near $20,000 will be expended on this work. Of all the promising showings on Moresby Island the most work has been done on the Ikeda and the new bondholders are confident that future development will make a mine of the property. It is possible that a smelter will be erected at Ikeda Bay to treat the product of this mine, and of others now being opened up on the island.

Arrangements are being made by A. E. Rand, of West-

minster, to open up the Dundee mine at Ymir, in which he is interested . The Guggenheims have started work on a $400,000 plant at Concrete, which will furnish cheap power to a very rich district on Baker River. The Sullivan group of copper claims on Moresby Island has been sold to a Vancouver syndicate for $50,000.

The Canadian Mining Institute has recently made a couple of requests of the Government, of which there can be no doubt but they are economically reasonable. These are that the Provincial Government make an annual grant toward the movement and that the Dominion Government remove the duty from life-saving apparatus for mines. The benefits of an organization that fosters an important industry are too well known to repeat, while every inducement rather than impediment, should be made to the mining men of the country, that life-saving apparatus may be found in all the mining camps of the Dominion. Of course, this particularly applies to the coal-mining industry, but deaths from powder, gas etc., are not infrequent in the metal mines. To this end it is hoped by those interested here that these two resolutions of the Mining Institute will bear fruit.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—Lieut.-Gov. Fraser, in opening the House of Assembly, made the following references to mining and other cognate matters: The adjustment of difficulties between the coal and steel industries of the eastern section of the Province is a matter of profound satisfaction. The amalgamation of the conflicting interests will, I am assured, result in the continued and more extended development of these industries. The immediate realization of the full benefits to be derived therefrom has been much retarded by the continuance of an unfortunate and prolonged strike It is a matter of sincere hope that some means may shortly be found for the satisfactory settlement of this deplorable affair, which affects so large a section of our population and has so important a bearing on the industrial growth of our Province.

The output of our coal mines, owing chiefly to the results of strikes, was materially less than last year. Notwithstanding the temporary reduction in output, the work of developing our coal fields has been carried steadily on, and the same high efficiency as regards the safety to life of those engaged in mining maintained.

It is gratifying to note that there has been during the past season a vigorous development of our iron mines and gypsum quarries, and that the yield of gold shows an improvement over last year

During the past year, the Technical College was completed, and is now offering courses in Civil, Electrical, Mechanical and Mining Engineering I am pleased to observe that a satisfactory number of students is in attendance from this Province and the neighbouring province of New Brunswick. Free Scholarships have been established for every county in the Province, so that any ambitious boy may now secure the highest type of engineering training. The coal mining schools and engineering schools have retained their firmly-established position in the colliery district, and the local technical schools have enjoyed a largely increased attendance. In the public schools in coal mining districts practical courses designed to train boys for practical life in a colliery have been introduced as subjects for some of the general courses. It is a matter of gratification to learn that the Nova Scotia system of technical education has attracted wide attention and much favourable comment.

ONTARIO.

Ottawa, Ont., March 5.—Since the opening of the Royal Mint on January 1, 1908, according to a return produced yesterday, there has been a net profit to the Dominion of $63,857.86, after allowing $13,100 as interest on the cost of construction.

The profit on the coinage of silver was $172,244.79, on bronze $21.565.11 and miscellaneous, $1,148.80, giving a total gross profit of $194,958.71.

Deporting United States silver from Canada involves considerable expense. The experiment was first tried in 1906. In that year the value of coin returned to New York was $580,224.16, and the cost of removal $7,383.20. The policy then lapsed for three years.

It was started again August 30, 1908, and from then to January 19, 1910, it cost $5,197.95 to deport coin valued at $561,760.49.

Ottawa.—It is not the intention of the Government to renew iron and steel bounties which finally expire at the end of the coming fiscal year. The bounties have now been in force for fourteen years, and the Government believes that the iron and steel industries are now established on sufficiently firm basis to do without the annual subsidy from the Federal treasury. The dividends paid and the increasing outputs of the large industries that have been built up since 1896 are an evidence of this. The total amount paid in bounties last year was on pig iron, $693,423; on steel, $838,100, and on manufactures of steel, $333.091. Since 1906 the total bounties on iron and steel have amounted to over fourteen million dollars.

Cobalt.—Arrangements have been made with the Northern Customs Concentrators whereby forty tons of the dump ore from the City of Cobalt mine will be treated daily in their large mill. The City of Cobalt have some 12,000 tons running twenty-five ounces on their dumps, and it is hoped to put all this through the mill. The recovery is about 85 per cent., and the rate about twenty to one. The company has loaded the first high-grade car for the year, although three cars of screenings, running 300 ounces to the ton, have been shipped since January 1st. Manager Southworth employs four drills underground and a force of fifty men.

Cobalt.—The Little Nipissing Co. has just shipped 60 tons of medium grade ore to New York, bringing their total shipments in February up to 84 tons.

Port Arthur.—The Mining Recorder at Port Arthur is a very busy man. Many claims are being recorded, especially in the vicinity of Savant Lake. The Recorder complains that prospectors make the mistake of sending mere statements by letter as to the work done, whereas the law requires a regular report along with a sworn affidavit.

BRITISH COLUMBIA.

Fernie.—The output of the Crow's Nest Pass Coal Company for the month of January reached the total of 95,000 tons. Of this, 25,000 was mined at Coal Creek and 43,000 at Michel. This is an average of 4,100 tons daily, and is the record for these mines. The total tonnage of the Crow's Nest mines for 1909 was 899,045, of which 425,659 tons were mined at Coal Creek, and 437,317 at Michel. The Fernie coke ovens turned out during the year 131,339 tons and the Michel plant produced 118,914 tons, a total production of coke for the year of 250,254 tons. At the present rate of increase the company's mines will pass the million and a quarter mark this year. But fast as the product of its mines grows, it does not keep pace with the demand. The

Hillcrest mines began last week the delivery of 25,000 tons of Hillcrest coal to the Great Northern Railway at Michel, where it is being transferred to the tracks of the Great Northern for delivery to various points on the Hill system.

Rossland.—Shipments continue to be made each week from the Le Roi, of ore of good grade, and the proceeds derived from its sale materially aid in keeping the mine in operation. Diamond drills continue to explore the territory of the Le Roi for new bodies and the borings have reached the territory 1,000 feet below the 1650-foot level. While the results are encouraging, no very large bodies of pay ore have been encountered so far, still some medium-sized bodies of pay ore have been located.

Work on the Mayflower is making good progress and there has been found in the main ledge a foot and a half of steel galena that goes from $40 to $60 to the ton. This is being extracted, and within a few days a shipment will be made to the Trail smelter. The lessee is very much pleased with the manner in which the Mayflower is developing.

Following is the report of the Le Roi Two for the month of January, which was cabled to London by Ernest Levy, the mine manager: "Josie Mine Report for January: Shipped 2.440 tons. The receipts from smelter are $42,358 (£8.734), being payment for 2,200 tons shipped, and $1,515 (£312), being payment for 58 tons concentrates shipped. In all $43,873 (£9,040).

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

The legislative programme of the Miners' Federation for the present session is to be restricted to the introduction of the Checkweighers Bill, which proposed to improve the law as affecting checkweighers by compelling the provision of adequate shelter on the pit bank for the accommodation of the checkweigher and a protection against the weather. There are also clauses designed to give the checkweigher greater freedom of action in taking part in meetings of the men off the colliery premises and as an official of the trade union. The programme is the most modest which the miners have submitted to Parliament for many years.

The Miners' Conference, representative of the South Wales coalfield, sitting at Cardiff on February 19, decided to continue the negotiations with the coal-owners for the making of a new wage agreement. It was a contest between the cautious and statesmanlike policy of the Executive, who recommended the men to resume the negotiations with the employers, and the extreme policy of the more hot-headed who desired the calling of a national conference of the Miners' Federation to take national action—in other words, a national strike. The moderate counsel of the Executive was affirmed by a majority of five to one, and the negotiations with the employers will be resumed in Cardiff on Thursday next.

RHODESIA.

The working of the full plant of the Giant Mines is giving every satisfaction.

The sinking of the main shaft on the New Found Out mine is being proceeded with, and is expected shortly to reach the fourth level.

The Exploring Land and Minerals Company has arranged with Mr. F. P. Mennell to make a complete geological survey of their large mineral properties in the Matabeleland and Mashonaland, especially with reference to the rich properties situated midway between the Globe and Phoenix and Ivanhoe mines.

The Rhodesia Gold Explorers is negotiating an option on the Juanita property in the Bulawayo neighbourhood. The assays range from 6 to 24 dwts. There are five shafts, already down a considerable depth and numerous old workings.

SOUTH AFRICA.

Before the Powers Commission recently held at Johannesburg, Mr. Ryersbach made the following statement as to the savings which would be effected by individual mines by taking power from the supply company in preference to erecting generating plant for themselves: "The saving in capital cost can best be illustrated by one or two examples. It is estimated that the City Deep, Ltd., after having spent £223,000 on plant, will require to spend a further £436,000 if power is purchased. If the company erects its own power plant, the further expenditure to be incurred is estimated at £560,000, being a difference of £124,000 in favour of the electric scheme. The estimate is based on a capacity of 65,000 tons per month; that is, the saving per 1,000 tons monthly capacity in this instance is estimated at £1,900. Similarly, in the case of the Nourse Mines, Ltd., and the Jumpers Deep, Ltd., for both of which increases in plant to deal with an additional 23,000 tons monthly have been sanctioned, it is estimated that the capital expenditure will amount to £25,100 for the former and £23,800 for the latter. It will be seen that the saving per 1,000 tons per month is considerably greater in the case of a new plant than where additions only are being made."

MEXICO.

The El Oro Mine earned a net profit of £18,158 in January, which may be regarded as quite good. Both mills are still running, but one mill may shortly be put out of service now that the tube mill plant is completed. The ventilating plant has made connection with the 1,000-foot level, and within a month or so encouraging developments at the lower levels should be reported. The Mexico Mine earned £12,558 during the past month, which is rather under the average of previous months. This has had no effect on the shares, which are now standing at 8⅝.

UNITED STATES.

Los Angeles, Cal.,—The 1910 convention of the American Mining Congress will be held in Los Angeles, beginning September 26 and continuing through the week, ending October 1, The Sierra Madre Club has already guaranteed the sum of $10,000, half of which is to be applied to furtherance of the legislative programme in Washington, and will now endeavour to increase the entire fund to $25,000. The supervision of the convention will be in the hands of an advisory board, including representation from all public bodies in Los Angeles and every important mining and oil town in Southern California, Arizona and Nevada, while the details will be in charge of an executive committee of three, with Sidney Norman acting as managing director.

Washington, D. C. Feb. 25.—An interesting light was thrown upon the Alaskan mining land situation yesterday when Delegate Wickersham told the House committee on territories that the miners hold their claims by force of firearms.

"Every acre of mining land in Alaska is held by a rope of sand," declared Wickersham. "Every claim is open to litigation."

Houghton, Mich. March 4.—It is reported that, for the double purpose of defeating the designs of the Western Federation of Miners, whose organizers have been active in this district lately, and of reducing the copper output, all mines in the Lake district are preparing to close down at once for an indefinite length of time, or until the ends aimed at by the managers can be attained.

Whether the Calumet and Hecla is included in the plan has not as yet been definitely made public, but from reliable sources it is said that they are.

If the plans are carried to their fullest execution, many thousands of men will be out of employment and a reduction of copper production effected that cannot but have an immediate effect on the price of the metal.

Coupled with the entailment at Butte on account of labour troubles, and the general tendency to reduce output in the western mines, far-reaching and immediate results are looked for in connection with the latest move of the big Lake producers.

Company Notes

The annual meeting of the shareholders of the Intercolonial Coal Mining Company took place on March 2, in Montreal.

The output of coal and coke for the year ending 31st December, 1909, amounted to 296,999 tons. The following were elected directors: Messrs. James P. Cleghorn, W. M. Ramsay, R. Mac, D. Paterson, K. W. Blackwell, E. Goff Penny, D. Forbes Angus and Duncan Robertson. At a meeting of the Board, Mr. Jas P. Cleghorn was re-elected president; Mr. D. Forbes Angus, vice-president and managing director, and Mr. C. A. Down, secretary-treasurer.

The Granby directors met in New York on March 1st, and no action on the dividend was taken. The statement was made that nothing would be done in the matter until all the new stock has been issued. In December a dividend of 2 per cent. was declared.

The Dominion Iron and Steel directors declared a dividend of 31½ per cent. on the company's preferred stock. This dividend includes 28½ per cent. of deferred payments, and 3½ per cent. for the current quarter. The entire amount of deferred dividends will consequently be wiped out when the 31½ per cent payment is made on April 1.

Ninth Annual Report of the Nova Scotia Steel & Coal Co.,

Directors' Report.

Your Directors herewith submit their Ninth Annual Report with statement of assets and liabilities, and abstract of profit and loss account for the year ended December 31st, 1909.

The profits for the year amounted to $907,949.00, as compared with $734,701.53 for 1908. In view of the depressed condition of business during the greater part of the year, this result should be regarded with satisfaction by the share-holders.

The amount at the credit of profit and loss account on January 1, 1909, was $1,219,221.07, against which the stock dividend of $1,000,000,00, declared in December, 1909, was charged.

The various amounts transferred to the reserve fund and fire insurance fund, and written off for improvements and betterments, are shown by the accounts.

A sum of $184,453.54 for premium and commission on redemption of old and issue of new bonds has been paid out of the profits of the year.

The balance carried forward to the credit of profit and loss account is $336,807.38.

The sum of $362,653.17 has been expended during the year on capital account, in the development of the submarine iron ore areas at Wabana, and for improvements, plant, etc., elsewhere.

The volume of business transacted by the company during the year shows a substantial increase, and is in excess of any previous year, and it is expected that there will be a still further increase in 1910.

The development of our submarine iron ore areas at Wabana was continued, the main stope being extended through these areas a further distance of 1,470 feet The stope is now about 1,650 feet into our own areas from their southern boundary. The development work carried on has fully confirmed the estimates previously made as to the vast quantity of ore contained in, and the great value of these areas. The plant for the operation of these submarine mines is now being installed.

Considerable extensions and improvements have been made to the mills at New Glasgow, and further extensions and improvements will be made in 1910, with a view to increasing the output of finished steel.

The re-organization of the finances of the company, authorized by the shareholders, has been carried out. A new issue of $6,000,000.00 5% First Mortgage Bonds, and an issue of $1,000,000.00 6% Debenture Stock were made; $3,500,000.00 of the bonds and the $1,000,000.00 6% Debenture Stock were sold in Canada, and the two former issues of 6% bonds were paid off and cancelled. The balance of $2,500,000.00 of the bonds remains in the treasury. No portion of the premium on the retirement of the old bonds, nor of the commission on the new issue has been charged to Property Account.

The regular dividend of 2% quarterly has been paid on the preferred shares, and on January 15th a quarterly dividend of 1% was paid on the ordinary shares, and the directors have declared further dividends of 1% on the ordinary shares, and 2% on the preferred shares, payable on April 15th, to shareholders of record on March 31st, 1910.

All of which is respectfully submitted.

February 18th, 1910. ROBERT E. HARRIS, President.

The annual meeting of the shareholders of the Western Coal and Coke Company was held at the head office of the company, 501 Power Building, Montreal, on Monday, February 14th, when the following directors were re-appointed: E. B. Greenshields, Senator Mackay, J. B. Ferguson, Charles Fergie, H. A. Lovett, J. W. McConnell, G. B. Woods, J. N. Lake and J. E. Woods. The managing director, Mr. Charles Fergie, reported that development work was making rapid progress, and that the mine would be in a position to produce 800 to 1,000 tons a day by the end of the year, also that the coal was of excellent quality and had recently been tested by the Canadian Pacific Railway Company on their engines with satisfactory results.

At the subsequent meeting of the directors, Mr. J. B. Ferguson, who had held the office of president for the past two years, resigned the office owing to ill-health and the fact that he would be somewhat out of touch with the head office as he now resided at St. Catharines, Ont. Mr. Ferguson nominated Mr. E. B. Greenshields, who is largely interested in the company, as president. Mr. Greenshields was elected by unanimous vote; and Hon. Robert Mackay and J. B. Ferguson were elected vice-presidents. Mr. Chas. Fergie was re-appointed managing director.

STATISTICS AND RETURNS

TRAIL SMELTER.

The Consolidated Mining & Smelting Company of Canada, Limited, ore receipts at Trail Smelter for week ending February 26th, and year to date, in tons:—

Company's Mines.		
Centre Star	3,623	29,471
St. Eugene (concentrates)	194	3,209
Snowshoe	4,822	31,288

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending March 4, and those from Jan. 1, 1910, to date:—

	Week ending Mar. 4. Ore in lbs.	Since Jan. 1 Ore in lbs.
Buffalo	56,619	292,453
City of Cobalt	.....	193,970
Cobalt Central	40,900	165,286
Cobalt Lake	.....	132,000
Colonial	.....	63,660
Coniagas	51,600	295,757
Crown Reserve	146,034	951,359
Drummond	.....	664,200
Hudson Bay	.....	62,365
Kerr Lake	.....	1,074,489
King Edward	.....	93,129
La Rose	303,312	2,051,901
McKinley-Darragh	63,063	271,860
Nipissing	456,433	1,949,053
O'Brien	129,900	328,806
Peterson Lake	120,850	170,450
Right of Way	62,643	253,436
Silver Cliff	.....	66,010
Temiskaming	60,000	180,000
Trethewey	.....	127,000

Ore shipments for week ending March 4, were 1,491,354 pounds, or 745 tons.

Total shipments from Jan. 1. to March 4, were 9,387,184 pounds, or 4,693 tons.

Total shipments for 1909 were 30,098 tons.

GOWGANDA SHIPMENTS.

Following is a list of the shipments of ore from Gowganda for the present year:—

Jan. 1 Millerett	30
Jan. 14 Reeves-Dobie	30
Jan. 22 Reeves-Dobie	32
Jan. 29 Millerett	29
Feb. 12 Millerett	30
Feb. 12 Burke-Remey (test shipment)	2
Feb. 24 Millerett	26

The Buffalo Mines, Ltd. reports for January: Mill ran 558 hours and milled 2,770 tons of ore; silver recovered, 103,549 ounces; milling expenses, $6,572. The ounces of silves paid for during the month shipped previously, 97,721 ounces.

The February output of the Nova Scotia Steel & Coal Company was 61,000 tons of coal, 6,800 tons of steel and 5,000 tons of pig iron.

BRITISH COLUMBIA ORE SHIPMENTS.

Nelson, B. C., February 19.—The weekly output of the mines and the smelter ore receipts continue very satisfactory, but otherwise there has been no special mining news during the past seven days. Appended are the details:

NISSEN STAMPS

THE MODERN INDEPENDENT CIRCULAR MORTAR GRAVITY STAMP.

ADVANTAGES

MAXIMUM CRUSHING CAPACITY SECURED

BECAUSE—The feeding of ore into each individual mortar is under constant control.

Immediate free discharge of pulp as produced is secured.

Freedom from interruption of operation, is secured due to the independence of units, allowing any one or more units to be "hung up" without disturbing the operation of the rest.

QUALITY OF PULP—Owing to controlled feeding and screen discharge there are much less unmanagable slimes produced than with other mills.

POWER—Owing to the great crushing efficiency secured, the power to operate is about half that of other mills of the same capacity output.

WEARING QUALITIES—The shoes and dies wear evenly. The weight of the stamps can be maintained constant, counteracting wearing away of the metal.

The Canadian Fairbanks Co., Limited

Fairbanks Scales—Fairbanks-Morse Gas Engines

Montreal, Toronto, St. John, N.B. Winnipeg, Calgary, Vancouver.

Take Advantage of Several Specialists in One Organization.

¶ We analyse ores, minerals, metals and furnace products. Speed and accuracy are the features of our laboratories. We weigh, sample and assay lots for shippers. Let us represent you at Smelters and Refineries.

¶ Each department headed by a Specialist. We are fully organized to take entire charge of the technical work of mines or mining properties.

¶ Consult us about your mine equipment, your mill or your cyanide plant.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

GEOLOGICAL SURVEY

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

MARITIME PROVINCES

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

QUEBEC

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

ONTARIO

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta.

BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

THE NORTH WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.

THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

CANADA

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet.

1025. Waverley Sheet.

1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

ONTARIO

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1908. W. J. Wilson.

1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

YUKON

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

REPORTS

1072. Summary Report of the operations of the Geological Survey for year 1908.

1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.

1075. Gowganda Mining Division, 1908. W. H. Collins.

1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.

1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

General Passenger Department, Intercolonial Railway

MONCTON, N.B.

We illustrate the Hecla Mining Company's Hoisting Plant at Burke, Idaho, one of the largest of its kind and a good example of

The Westinghouse Equalizer Hoisting System

Some particulars of the installation follow:

The hoist motor is a Westinghouse 450 h. p., 600 Volt, 60 R. P. M. Direct-Current Motor, which obtains its power through a Westinghouse Fly-Wheel Motor—Generator Set, consisting of a 450 h.p., 2300 Volt. Type H. F. Induction Motor, a 30,000 lb. Fly Wheel and a 450 K. W., 600 Volt, Direct Current Generator. The normal duty of the hoist is 6,000 lbs. unbalanced load; maximum speed 2,000 R.P.M. ultimate depth of shaft 2400 feet.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

THIS TAN KHAKI DUCK SHIRT

$1.00

A great dollar's worth for Miners, Prospectors, Surveyors.

The kind of shirt that will turn a shower—you've seen them on sale time and again at $2.00, as these details will show you;—

Made from extra strong duck, double stitched throughout, with strong gussets, heavy yoke on shoulders, large long bodies, full sleeves with plenty of elbow-room, brass dome fasteners throughout, instead of buttons. Two pockets, with flaps and dome fasteners.

We've counted on a tremendous demand for this shirt and the quantities bought bring our price down to One Dollar.

N. B.—When ordering, be sure to ask for our "Dollar Invincible" shirt, and send 19 cents extra to cover postage. All sizes and half sizes from 14 to 18.

Amatite ROOFING

Saves Labor and Money

A roofing that has to be painted every year or two is a constant care. Suppose you should neglect to paint yours in time. The chances are that when you did remember, (which would probably be when you discovered it leaking) it would be too late to paint or patch. You would need a new roof.

Now you can avoid all this bother and expense by buying Amatite, which *needs no painting or coating of any kind.*

We will send you a sample free. Write for it to-day and settle the question for yourself. It will only cost you a postal card and will save you many dollars in the end.

Amatite comes in convenient rolls ready to be laid on the roof. Anyone can do the job. Liquid cement to seal the laps and large headed nails are supplied free in centre of each roll.

We wish you knew as much about Amatite as we do; you'd buy it every time. It's the kind of ready roofing that makes satisfied customers.

Send to-day for a free sample to nearest office. That tells the story

An Ideal Instrument
For Preliminary Surveying

THE STADIA HAND TRANSIT

The Stadia Hand Transit gives more accurate and quicker results than any similar portable instrument. It is thoroughly well made and will meet the requirements of those who are engaged on preliminary work, or on the subdivision of larger surveys made with a regular transit.

In measuring vertical angles, the sighted point and both scale readings (slopes and degrees) appear together in the field of view (see cut.)

Compass bearings can be taken by use of the telescope on level ground or by the folding sights on sloping ground.

THE C. M. I. COMMITTEE AT OTTAWA.

Recognizing that the Select Standing Committee of the House of Commons on Mines and Minerals was on the right track in its recommendations to the Federal Government, the Canadian Mining Institute appointed a committee to wait upon the Prime Minister and urge that these recommendations be carried into effect.

To refresh the memories of our readers, we shall recapitulate the three aforementioned recommendations: "Your committee is of the opinion (1) That there should be assigned to the Federal Department of Mines, the administration of mines, including the issuing of title thereto, and of all mining laws; (2) That an Act should be passed consolidating all the laws relating to mines under Federal control; (3) That consideration should be given to a policy which will have for its objects the re-acquisition by the Crown of mining rights heretofore granted in patents of land."

The first two recommendations will meet the approval of all mining men. They apply with especial force to the distressing conditions that obtain in Alberta and the Yukon. The last recommendation we are inclined to view with doubt. Its practicability is extremely debatable.

The Institute was represented by Messrs. G. G. S. Lindsey, T. B. Caldwell, A. M. Hay, Clifford E. Smith, and H. Mortimer-Lamb. Accompanying the committee were Mr. F. T. Congdon, M.P., and Mr. Ralph Smith, M.P., both of whom are members of the Select Standing Committee. The delegation was introduced to the Prime Minister by Mr. James Conmee, M.P.

As chairman of the delegation, Mr. G. G. S. Lindsey presented the views of the Institute. Other delegates spoke to the point. These utterances were strongly supported by the Minister of Mines, the Hon. Mr. Templeman. Their reception by Sir Wilfrid Laurier was distinctly favourable. He promised specifically that the first and second recommendations would be put into effect, and he suggested that the Canadian Mining Institute take on its own shoulders the task of consolidating and codifying the laws pertaining to mining lands under Federal control. This, he assured the delegation, the Government would introduce at the next session of Parliament.

After interviewing the Prime Minister, the delegation waited upon the Minister of Mines. Arrangements were then made for appointing a sub-committee of the Select Standing Committee to draft the Act consolidating the present mining laws. It was decided that a suitable appropriation be asked for, so that the sub-committee might be enabled to secure information from every desirable quarter. The Canadian Mining Insti-

tute delegates assured the minister of the entire sympathy and support of that body.

Previous delegations to Ottawa have not been uniformly successful. Lack of harmony and want of preparedness have usually marred their interviews. This last delegation, however, appears to have been excellently handled. Superfluous debate was avoided. The speakers confined themselves to the matter in hand. And the issue was in every way excellent.

To Mr. G. G. S. Lindsey, the chairman of the delegation, much praise is due. Mr. Lindsey's clear insight into the principles involved, and his grasp of business details are as valuable as they are unusual.

. . . . .

Before the Select Standing Committee, or its subcommittee, lies a large and urgent task. The support of the Canadian Mining Institute may be counted upon. Equally certain is the gratitude of all Canadian mining investors.

THE MINING SOCIETY OF NOVA SCOTIA.

The Eighteenth Annual Meeting of the Mining Society of Nova Scotia, held recently in Halifax, N.S., was remarkable in more than one respect. In the first place, several of the papers evoked an unusual amount of discussion and general interest. More than one of these will probably incite industrial development.

Particularly inspiring was the paper read by Dr. Heinrich Ries, of Cornell University. Dr. Ries outlined the possibilities of the clay industry in Nova Scotia, and gave specific information as to the extent and workability of the principal deposits. Quite as important was Dr. Ells' paper dealing with the commercial value of the oil shales of the Maritime Provinces, and Mr. Faribault's brief presentation of the geology and potentialities of the Moose River scheelite veins was most timely. Rarely have three such significant technical pronouncements been made at such a gathering.

Whilst the papers presented by local mining men were all meritorious, they do not demand especial notice here. We feel, however, that reference to the President's annual address is called for.

The key-note of Mr. Brown's address is contained in one sentence. "To my knowledge," he declared, "not one coal seam of commercial value has been discovered in Cape Breton, nor, indeed, with perhaps one exception, in the whole Province of Nova Scotia, since the year of Confederation." With this statement as a text, Mr. Brown dilated upon the earnest, careful, deliberate character that distinguished the labours and records of the colliery engineers of fifty years ago. Contrasting modern and past practice, he alluded to the intemperate haste, the incomplete records, and the consuming commercialism that are being developed. Briefly, but most pointedly, he indicated the wastefulness of present methods, and the surprisingly small advance that has been made in fuel economy, both as regards mining and power-generation.

While it is comparatively easy to pick flaws in Mr. Brown's statements, we believe that his logic is fundamentally sound. His address will be found on another page of the Canadian Mining Journal. It deserves careful perusal.

TOOL STEEL DIRECT FROM IRON ORE.

It should be a source of gratification to Canadians that a citizen of this country, Mr. J. W. Evans, of Belleville, has been the first investigator to succeed in producing high-class tool steel in an electric furnace direct from iron ore. Further, in his small furnace of 150 lb. capacity, Mr. Evans turned out his product at a cost of 9 6-10 cents per pound. The steel was tested at Hamilton and at McGill University, and was proved to be superior to standard brands. At Belleville, where the furnace is installed, electric energy costs $50 per horsepower per year. The cost per pound mentioned above is based upon this rate for power, and includes all charges, such as depreciation, briquetting, etc., etc.

So far as we can learn, Mr. Evans is the only metallurgist to solve the problem of making tool steel direct from titaniferous iron ores in the electric furnace. This he first accomplished in 1906. Since then he has been perfecting his process, until now it appears to be commercially feasible.

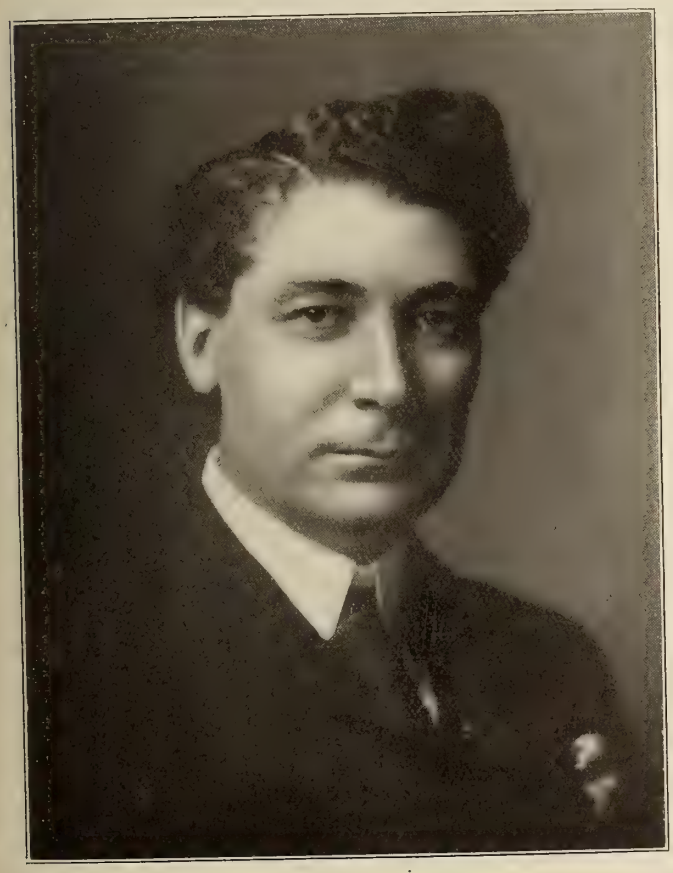
As a mark of its sense of the value of Mr. Evans' work, the Canadian Mining Institute, during its recent annual meeting, passed the following resolution: "Resolved, that the Institute desires to express its appreciation of the results achieved by J. W. Evans in his electric furnace, and regrets that illness prevents his attendance at this meeting."

We need only add that Mr. Evans has never sought to advertise himself or his work.

EDITORIAL NOTES.

Under the revised French tariff, it is proposed that certain asbestos goods are to be taxed as follows, per 100 kilos: Paper, 25 francs; cut up, other than rectangular, 50 francs; threads and cords, 60 francs; plaits and tissues (mixed or not), 75 francs. So far as Canada is concerned, the tariff on these articles will probably be modified by the application of the minimum tariff.

The fire that broke out in the Albion colliery, Stellarton, N.S., was fought and suppressed by ten men wearing Draeger breathing apparatus. These men had to be brought all the way from Glace Bay, Cape Breton. Without their aid, the loss would have been enormous. There could be no better illustration of the absolute necessity of establishing rescue stations at every Canadian coal mining centre.



The Western Branch of the Canadian Mining Institute, at a recent meeting, placed on record its high appreciation of the journalistic work done by Mr. E. Jacobs, of Victoria, B.C. The Canadian Mining Jour-

nal has more than once had occasion to commend the careful and conscientious articles written by Mr. Jacobs. It is pleasant to notice that his own associates are alive to the importance of his labours.

The prosecution in Toronto of the men accused of high-grading in Cobalt was conducted with lamentable looseness. The prosecuting attorney, as might naturally be expected, had no grip of mining or mineralogical technicalities. Hence he could not meet the arguments adduced in defence of the accused. Better machinery is certainly needed. In cases like these, specialists should be appointed by the Crown to conduct the prosecution.

The Eighteenth Annual Meeting of the Mining Society of Nova Scotia, Halifax, March 15 and 16, 1910.

The Mining Society of Nova Scotia has taken a new grip on life. Its eighteenth annual meeting was well attended. Vigorous discussions followed the reading of papers, and the general tone of the meetings was commendably enthusiastic. Particularly noticeable was the attendance of students from the new Technical College. Moreover, a most representative lot of visitors added much to the sessions.

T. J. BROWN, President.

Proceedings opened at 10.30 o'clock on Tuesday morning, March 15. After the secretary, Mr. A. A. Hayward, had read the minutes of the preceding annual meeting, the president, Mr. T. J. Brown, delivered his address.

PRESIDENTIAL ADDRESS.

The president, instead of the conventional review of progress, harked back to the past. He compared the work of the modern coal mining engineer to that of the men of half a century ago. His address was really a sermon against the haste and bustle of to-day as compared with the substantial accomplishment of fifty years ago. Whilst his criticisms of modern practice were severe, they were tempered by the fact that he himself is of this generation. Moreover, Mr. Brown's attitude was not didactic—he was merely indicating, with an occasional gleam of humour, the need of studying and respecting the pioneers of the profession. His address was, in part, as follows:—

"To my knowledge not one seam of commercial value has been discovered in Cape Breton, or indeed, with perhaps one exception, in the Province of Nova Scotia, since the year of Confederation. Mr. Richard Brown left us in book form the story of his work in prospecting the whole of Cape Breton.

"In this book, Mr. Brown has given geological information in connection with our coal seams in Cape Breton, and nothing of much importance has been added to this information, and nothing contained therein of any importance has been found in error.

"When we come to consider that the work this man did in Cape Breton was done through the wilderness on horseback, or around the shores in a small open boat, we get an idea of the thoroughness with which the engineers of the old school did their work, and the accuracy and the method with which they left us the benefit of their experience.

"Are we to believe that there is nothing more to discover in the way of coal seams? Or, are we to believe that no geologist of his experience and knowledge has devoted the time to it since? He was unaided at the time. He was the only mining engineer—or nearly so—on the Island. What have the host of modern, so-called, mining engineers now in Nova Scotia added in any way to the knowledge of our mineral possibilities, and where can their results be found?

"I believe that coal seams, as yet unknown, will be found in Cape Breton; and in Cumberland and Pictou counties, where the coal measures are not so regular as in Cape Breton, the possibilities are even greater. We have every facility offered in the way of Government boring machines. What do we lack? Is it men? Is it capital? Or is it knowledge? Let us think it over.

"Is it possible that the present miner is but a scavenger of coal, content to make the best of what he finds already staked out for him! Is it possible that the present generation are content to take the fruits of what previous giants of the province fought for and obtained for them—responsible government, confederation, discovery of all the coal seams of the province—all previous to 1867. Nothing doing since except enjoying or depleting our legacy.

"Perhaps the life the modern mining engineer is living to-day is too strenuous, and perhaps one of the lessons that we can learn from this comparison is that we are not giving enough attention to the literature of our mining doings of to-day.

"Such men as Brown, Routledge, Gilpin, Poole, Fletcher and perhaps some others, have left us the result of their work; but, strange to say, with the possible exception of Hon. Robert Drummond, who might be called the miners' statistician, very little has been done in preserving or giving us the literature of our mining and engineering progress during recent years.

The Province of Nova Scotia has been very fortunate—or, rather, unfortunate—in having had within its borders, at all times, but principally within the last twenty-five years, the greatest aggregation of visitors with scientific or mining titles, who were able to make coal seams grow where none existed, and able to make credulous investors put money where no possible returns could be expected. These men have come and gone in an endless procession. Each one the hero of the hour—duly honoured, dined and kowtowed to. The only visible record we have of them now is the country spotted here and there, in the most unlikely places, with mounds of fire-clay, and a once promising coal mine now surrounded by an old wire rope fence. We have been left the hole in the ground. The credulous investor has got the hole in his bank account. Still the never ending show goes on.

"The successful mining engineer to-day is the one who is near the capitalist, makes estimates of the cost of plant and dreams the assumed cost. The failure is the poor devil who is called upon to fulfil his dreams and to make the actual figures agree with those of the dream artist. One lives in a brown stone front in Tickerville, the other in a wooden row in Smokey Town.

"I know of a case where one of these high-class chaps offered the manager a sum of gold if he would undertake to have a certain piece of machinery working, and to keep it working while the president visited the plant. The manager succeeded and got the gold; but, needless to say, the machinery was scrapped and never made a revolution afterwards. Who was the success? And who was the failure?

"When we come to consider that God gave us 100 units of coal; that the modern mine engineer extracts about on an average of 50 per cent. of this coal, and wastes or leaves behind him 50 per cent.; that the modern engineer with his most modern boilers and engines extracts but 10 per cent. of the power, and loses in smoke and waste heat the remaining 90 per cent., we find that of God's gift we waste 95 units and utilize but 5 units. When we think this statement over we surely find no room, either as mining or mechanical engineers, to boast of our accomplishments.

"We have not made very much progress in the way of advance in the economical mining of coal during the last 50 years. I must admit that we have made considerable progress in methods of transporting, etc., but, as to the actual mining, we have not got far away from the old "bord" and "pillar" method of our forefathers.

"There are not enough bouquets to-day for the man with the safest colliery in the province, and there are too many halos for the fellow with the largest output.

"No progress has been made in the shipping of coal. We are still building wharves and expensive approaches to enable us to take coal up a height in order to let it fall down again.

"In connection with underground coal mining, we have still got the horse employed. We are still using blasting powder, making slack coal at one end and paying for expensive mechanical arrangement at the other for removing it.

"We are still boiling water at one end of an engine plant and allowing it to escape hot at the other.

"We are still using safety lamps only slightly better than that of Sir Humphrey Davies.

"We are generating enough power at the foot of a hollow brick stack to drive a small engine, and allowing sufficient to escape at the top to drive an Atlantic liner.

A. A HAYWARD, SECRETARY.

"Our Mining Act, with its amendments, would remind one of a brick building surrounded with small, cheap, wooden out-houses, some of them connected to the main building and some of them not, and most of them added to get over the exigencies of the moment, and few of them having the architectural soundness of the original structure.

"We appear to be in an age where we have ever increasing requisitions and ever increasing scrap piles. The modern engineer searching for a spare part in a scrap pile would look as much out of place as he would in overalls.

"The predecessors of the mining engineers of yesterday had for their motto: 1st, safety; 2nd, quality; 3rd, a reasonable dividend on the money invested. We are afraid that to-day our motto has deteriorated into: 1st, quantity; 2nd, quantity; 3rd, quantity.

"Some of the coal mines of Nova Scotia to-day are unable to make a success of coal mining from a monetary point of view, owing to the fact that a large percentage of their coal is made into slack coal in mining and in handling. I will not say that this was not a

serious drawback to the mining of coal in olden times, but I do say that the fact that this coal has got to be sacrificed or left on dumps to burn or become deteriorated, owing to the fact that the mechanical engineers have not yet progressed enough so that the boiler equipment plants of all kinds in the Province of Nova Scotia are not fitted to burn this refuse instead of the best quality of coal now generally consumed under boilers.

"It is unfortunate for the industry that our politicians are all coal mining engineers, and the coal mining men are all politicians.

"I have no doubt that some of you will think that most of the foregoing remarks are somewhat exaggerated. And I must admit that to reach the point I set to make I intentionally exalted the virtues of the older engineer, and depreciated the virtues of the modern engineer, both mining and mechanical. But I do so with the idea that if these things were forcibly brought to our notice it might result in our being charitable in our criticism of others, and less blinded and more alive to our present-day weaknesses.

"As I am supposed to have been connected with both the mining and mechanical engineering of collieries all my life time, and am so engaged at the present time, and as all these criticisms are aimed at men such as myself, I do not think it can be said of me that I had taken the opportunity here afforded me at hitting at any class of men with whom I was not closely identified.

"I have to thank you, gentlemen, for your attention and forbearance, and will take my seat, wishing our society, and every individual member of it, the greatest possible amount of success."

The afternoon of Tuesday was occupied in the presentation of the following papers:—"Tungsten Deposits at Moose River, N.S.," by Mr. E. R. Faribault; "Scheelite, the Ore of Tungsten, at Moose River, N. S.," by Mr. A. A. Hayward; "The Clays of Nova Scotia," by Dr. Heinrich Ries; "Treatment of Boiler Water," by Mr. A. L. McCallum.

On Tuesday evening the annual banquet was held at the Halifax Hotel. The only two speakers were Dr. Magill, of Dalhousie University, and Mr. Arthur Hawkes, of Toronto. Only one toast was drunk and that was, of course, to the King. This curtailment of the usual appalling succession of toasts and oratory is entirely worth while. It is almost superfluous to add that the menu and music were excellent.

The Wednesday morning session was devoted largely to the reading and discussing of Dr. R. W. Ells' paper, "The Commercial Value of the Oil Shales of Eastern Canada, Based on Their Contents by Analyses in Crude Oil and Sulphate of Ammonia."

The papers read during the afternoon were as follows:—"Blast Furnace Slack Handling and Charging Apparatus," by Mr. W. H. Graham; "Practical and Economic Mining," by Mr. Neil A. Nicholson; and "The Use of Coke Oven Gas as a Fuel," by Mr. T. J. Brown.

Other papers read by title were:—"Description of Haulage System Installed to Take the Place of Horses at Nos. 3 and 4 Collieries of the N. S. Steel and Coal Company," by Mr. John Johnston; "Notes on the Use of Explosives and the Methods of Shot Firing," by Mr. C. E. Coll; "Description of Electric Endless Haulage at Colliery No. 5 of the N. S. Steel and Coal Company," by Mr. Robert Robinson; and "Use of Low Grade Fuel Under Boilers," by Mr. John Preston.

CANADIAN MINING INSTITUTE—WESTERN BRANCH.

At the recent meeting at Vancouver, Mr. Thomas Kiddie, in his address as retiring chairman of the Western Branch of the Canadian Mining Institute, stated that the total value of the mineral production of the coast district during the last ten years was rather more than $50,000,000. While this represented only about one-fourth of the value of the mineral production of the province, it was a large amount, for it showed an average yearly value of slightly more than $5,000,000.

Although the production of placer gold in the province had not shown any substantial increase in recent years, there were features to-day that warranted the expectation of considerable improvement in the near future. He need only make passing reference to the fact that in the Cariboo district there were two or three hydraulic mining enterprises on a comparatively large scale, either already established or being prepared for. In the Atlin district there was also good reason to look for an increase as operations were enlarged. Lode gold mining gave promise of yielding larger total returns both from stamp milling operations in the Hedley camp in the Similkameen district and in the Sheep Creek camp in the Nelson district. The considerable increase in the smelting of copper ores containing gold would also add to the production of the yellow metal.

"The production of silver is greater now than it was a year or two ago," continued Mr. Kiddie. "Operations in the Slocan district, Ainsworth mining division, are being extended, and the quantity of silver extracted from the ores mined in that district being added up. In this connection it is noteworthy that the Consolidated Mining and Smelting Company of Canada is producing comparatively large quantities of refined silver as well as gold at its works at Trail, West Kootenay, and is selling part of its product to the Ottawa branch of the Royal Mint, for use in coining Canadian money. The beneficial effect of the lead bounty paid by the Dominion Government on silver-lead and lead mined in Canada is seen in the continued operations of numbers of silver-lead and lead mines in both East and West Kootenay districts. At Trail, where is situated the only operating lead smelting and refining works in Western Canada, many improvements and enlargements have recently been made, these providing for the smelting of a larger tonnage of lead ores. In the increase of size of the lead blast furnaces, installation of more Huntington-Heberlein roasters and converting pots, and in the considerable extention of the electrolytic lead refinery, are evidences of substantial progress.

"The mining of copper ores on a large scale is being continued, notably in the Boundary district, where about 6,000 tons of ore a day are being mined, and the greater part of this large tonnage smelted at district smelting works. The important improvements lately completed at the Granby smeltery, bringing its total treatment capacity up to about 4,500 tons of ore a day, and its copper converting capacity to about 36,000,000 pounds of copper per annum, are indicative of the advance being made in this branch of mining and smelting. The smelting works of the B. C. Copper Co., too, are quite modern and of large capacity, while at Trail the Consolidated Mining and Smelting Co. has built the largest copper blast furnaces in Canada, and is also enlarging its copper smelting operations. On the coast important improvements have been made at the Tyee Copper Co.'s works at Ladysmith, where there has been

installed a second blast furnace of larger capacity than previously in use at those works, and other additions to plant have been made to provide for the steady increase in copper smelting that this company is bringing about."

The chairman also dealt with the prospects of iron mining and smelting on the coast and the problem of a profitable method of testing low-grade zinc ores. There had been much expansion in coal mining and the production of coke. In addition to a large output having been made from the older collieries, several new ones were now producing, so that the total output for the province would be substantially increased. In conclusion it might be said, with confidence, that there was much promise of greater progress in the near future, and that mining would become more profitable than it had been in the past.

The Secretary's report showed that the Western Branch started the year 1909 with a membership of 189 and ended it with a roll of 201.

On ballot being taken for the chairmanship, Mr. W. Fleet Robertson, the provincial mineralogist, was elected, receiving 65 ballots. Mr. E. Jacobs was re-elected Secretary.

It was decided to hold the next meeting at Grand Forks.

On motion of Mr. A. G. Langley, it was resolved to ask the Dominion Government to connect the Portland Canal with the main line of telegraph communication in Northern British Columbia. The meeting also resolved to petition the Provincial Government to establish a survey line and marks in the Portland Canal district for the convenience of surveyors there.

Mr. Trewartha-James raised the question of remitting the duty on life-saving apparatus in mines. At present there was 33 1-3 per cent. duty levied on such apparatus in Canada; but in the United States it was admitted free. The apparatus cost from $100 to $200 per unit, and several were needed in each coal mine, especially where gaseous vapour was prevalent. The remission of the duty would encourage mines to obtain such equipment, which was only manufactured in Europe. It was decided to request the Dominion Government to remit the duty, and Mr. E. Buchanan promised to induce the Vancouver Board of Trade, and Mr. W. H. Trewartha-James the Victoria Board, to support this request.

Subsequently the meeting discussed Mr. Kiddie's paper on "Cause of Variation in Ore Sampling," and Mr. S. C. Castleman read a paper on the "Classification of Nicola Valley Coals," which stimulated a great deal of discussion, Mr. Robertson remarking that the figures given showed that the coal was a low carbon bituminous. Mr. Kiddie also read a paper on "Metal Losses in Copper Slags.

LEGAL COLUMN.

The only amendments to the Mining Act of Ontario passed by the Legislature at its recent sitting relate to the performance of working conditions.

Sub-section 3 of section 78, relating to the report of performance filed by the holder is amended by requiring that "the report shall show in detail the names and residences of the men that performed the work and dates upon which they worked in its performance."

The next sub-section, sub-section 4 of section 78, is the section brought under judicial notice in the case re Perkins and Dowling, referred to in the issue of February 1st. The section formerly read, "The Recorder, if satisfied that the prescribed work has been duly performed, may grant a certificate ..... but he may first, if he deems proper, inspect or order the inspection of the work or otherwise investigate the question of its sufficiency and his decision thereon shall be final unless appeal is made to the Commissioner, whose decision shall be final." The contention was raised that the decision of the Commissioner was not final unless he had made an inspection or investigation under the foregoing provisions. The Divisional Court held that the decision of the Commissioner was final whether or not any inspection of investigation had been made by him before giving his decision.

The amendment of this section reads as follows: "Such certificate in the absence of fraud or mistake, shall be final and conclusive evidence of the due performance of the work therein certified, but where it has been issued in mistake, or obtained by fraud the Commissioner shall have power to revoke and cancel it upon the application of the Crown or an officer of the Bureau of Mines or any person interested. The question of the due performance of work shall not be appealable beyond the Commissioner."

It will be noted that there is no word "sufficient" in the original section, but it seems to be obvious that "sufficiency" is the word intended.

But apart from this the effect of the slipshod amendment is doubtful. The first part of it appears to set out that the Recorder's certificate is final except where there has been fraud or mistake—thus cutting out the appeal formerly allowed to the Mining Commissioner. The last clause of the amendment appears to give it the opposite effect. Then there are the nice questions of what "mistake" means, and what is a "person interested."

Thus the benevolent intention of the legislature to allow the cancellation of certificates where fraud or mistake is shown (the principle that the general law allows without statutory authority)) is probably quite overshadowed with the new complications the amendment introduces.

ELECTRICITY IN MINES.

In addressing the Birmingham University Mining Society last month, Mr. R. Nelson, His Majesty's Inspector of Mines, referred to the rapid growth of the employment of electrical power in mines in recent years. He stated that electricity usually yielded 80 per cent. efficiency, as compared with only about 20 per cent. by compressed air. What was required where electricity was employed underground was a gas-tight fitting of strong glass in certain places as a protection against ignition of gas or coal dust.

The Sullivan Machinery Co. reports that it is installing four of its tandem Corliss compound steam and two-stage air compressors for the Mason & Hanger Company at Cornwall, New York, where the above company has a contract for one of the siphons or tunnels for the New York Board of Water Supply. Each of the above units has a capacity of approximately 2,500 cubic feet of free air per minute, so that the completed plant will furnish 10,000 cubic feet of free air per minute. These compressors operate on the same steam consumption as Corliss cross compound condensing engines of the same stroke, and owing to their tandem construction, the cost of freight, engine room and foundations is about half of a cross compound installation of the same capacity.

COBALT IN 1910.

Abstract of Report of Arthur A. Cole, Mining Engineer, T. & N. O. R. Commission, for Cobalt District, Year 1909

The following table will illustrate the steady progress of the Cobalt District since its discovery:

TABLE I.

Year.	Tonnage.	Value.
1904	158.55	$136,217.00
1904	2,336.01	1,485,570.00
1906	5,836.59	3,573,908.00
1907	14,851.34	6,155,391.00
1908	25,362.10	9,133,378.00
1909	29,942.99	12,000,000.00 (Estimated)
	78,487.58	$32,484,464 00

It will be seen from the above table that Cobalt has produced ore valued at $32,484,464, and it is noteworthy that of this amount almost 50 per cent. has been repaid to the operators in dividends.

Cobalt now supplies about 12 per cent. of the world's silver production, being 24,000,000 ounces (estimated) for 1909, and this alone with the production from British Columbia easily places Canada in the third position as a silver producer.

Table 2 shows the silver production of the leading silver mining countries in the world for 1907, 1908 and 1909. The figures for 1907 and 1908 are taken from the Mineral Industry, and those for 1909 are estimated.

TABLE II.

Country.	1907.	1908.	1909.
	ozs.	ozs.	ozs.

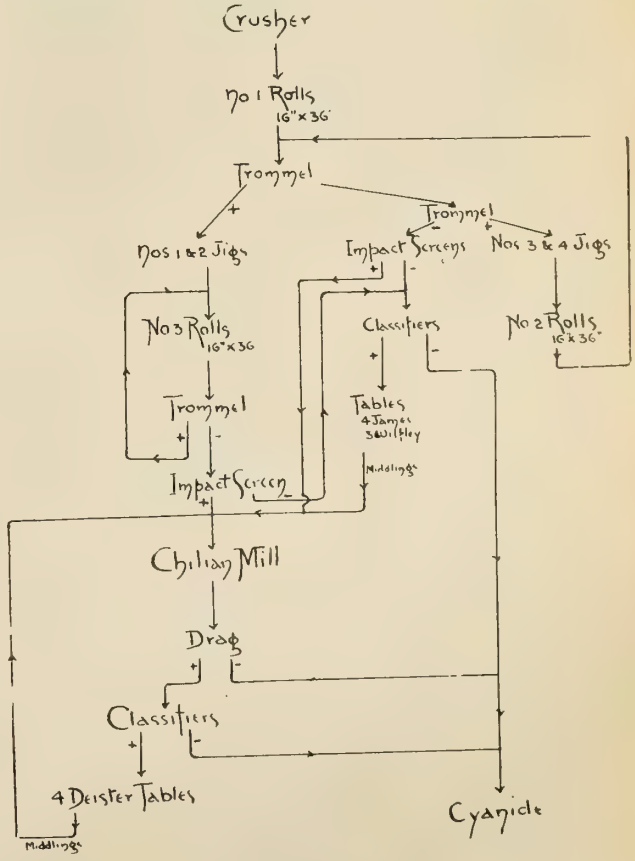
Of the 28 shippers for 1909, 14 paid dividends during the year amounting to about $6,150,000.

The ore produced during 1907, 1908 and 1909 was shipped to the following countries for treatment:

Country.	1907.		1908.		1909.	
	Tons.	%	Tons.	%	Tons.	%
Canada	2,585.05	17.40	7,401.14	29.18	10,230.64	34.47
Great Britain	167.13	1.13	222.08	.88	30.25	.10
United States	12,098.95	81.47	17,439.42	68.76	19,576.59	65.03
Germany	.....	.....	229.46	1.18	106 51	.35
Totals	14,851.34	100.00	25,362.10	100.00	29,942.99	100.00



Silver.

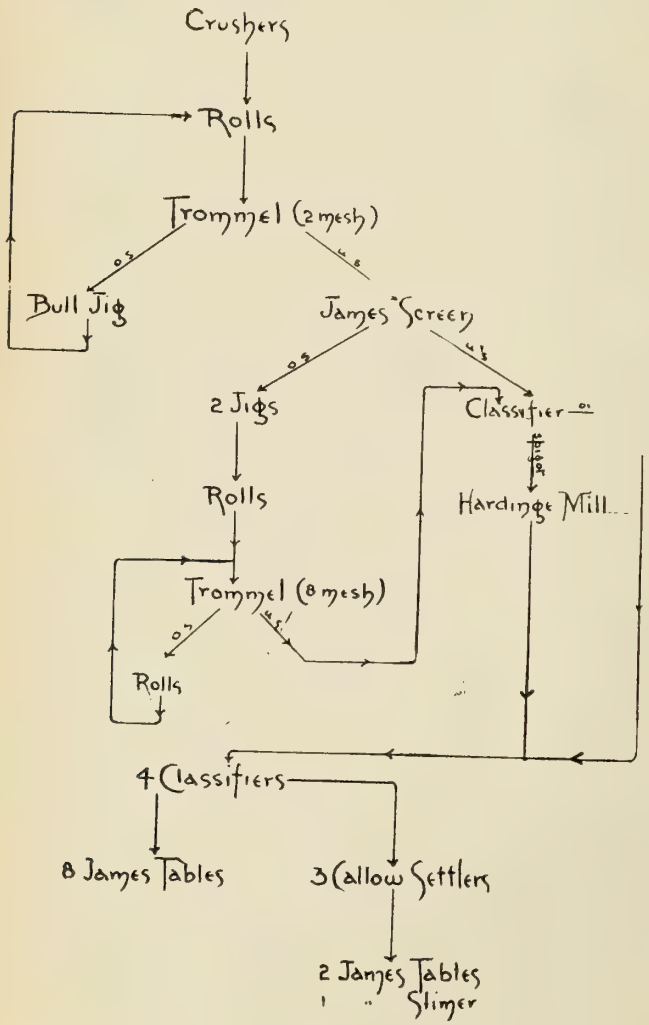
Though the price during the year was low the fluctuations were not great, and it was continuously better than the low level reached in December of 1908.

The average price of silver for 1909 was 51.503 cents per ounce. The highest monthly average was 52.905 cents in May, and the lowest was 50.703 cents in November.

Cobalt.

Cobalt oxide is now produced in such comparatively large quantities as a by-product from the Cobalt silver ores that there has been no demand during the year for Cobalt ores solely for their cobalt contents. The market has been revolutionized. In 1907 the oxide sold for $2.50 per pound. By the 1st of April, 1908, it had dropped to $1.45 per pound, and at the close of 1909 it is being offered at 80 to 85 cents per pound.

1. FLOW SHEET, BUFFALO CONCENTRATOR.



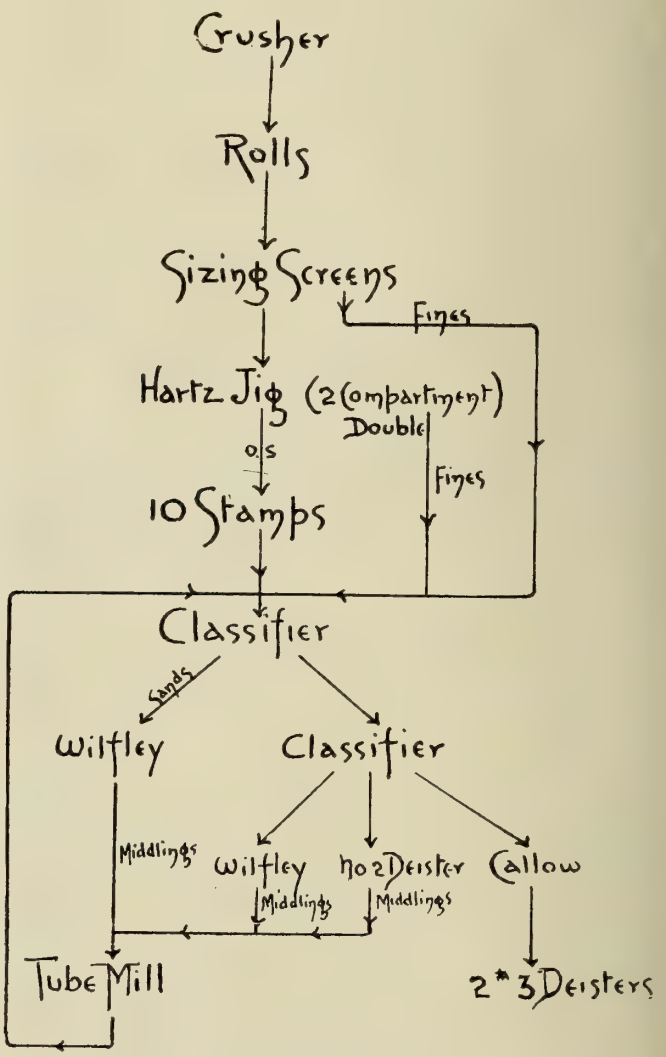
The three Canadian Smelting Companies treating high grade silver ores from cobalt pay a small amount for the cobalt contents in these ores under certain conditions, when they run over 6 per cent. metallic cobalt.

Nickel and Arsenic.

The other metals found in Cobalt ores besides the silver and cobalt, are nickel and arsenic. These are saved in part by some of the smelting companies, but are not paid for, but on the other hand they are both frequently penalized.

Sampling.

A customs sampling mill is now being erected in Cobalt by Messrs. Campbell and Deyell, of Cobalt. The mill is designed to sample both high and low grade ores, but only the high grade part is being installed at present.



2. FLOW SHEET, COBALT CENTRAL CONCENTRATOR.

Smelting.

The ores produced in the Cobalt District were shipped for treatment during 1909 to the following smelting companies:

1. American Smelting & Refining Company, New York, U. S. A.
2. Balbach Smelting & Refining Company, Newark, N.J., U.S.A.
3. Beer, Sondheimer & Company, Frankfort-on-Main, Germany.
4. Canadian Copper Company, Copper Cliff, Ontario, Canada.
5. Coniagas Reduction Company of Canada, St. Catharines, Ont., Canada.
6. Deloro Mining & Reduction Company, Deloro, Ont., Canada.
7. Pennsylvania Smelting Company, Pittsburg, Pa., U. S. A.
8. Quirk, Barton & Company, London, England.
9. United States Metals Refining Company, New York, U. S. A.

The Montreal Reduction and Smelting Company of Canada, with works at Trout Mills, Ontario, also received some low grade ore from Cobalt, but this was treated by water-concentration, as this company has not yet commenced smelting operations.

3. FLOW SHEET, COLONIAL CONCENTRATOR.

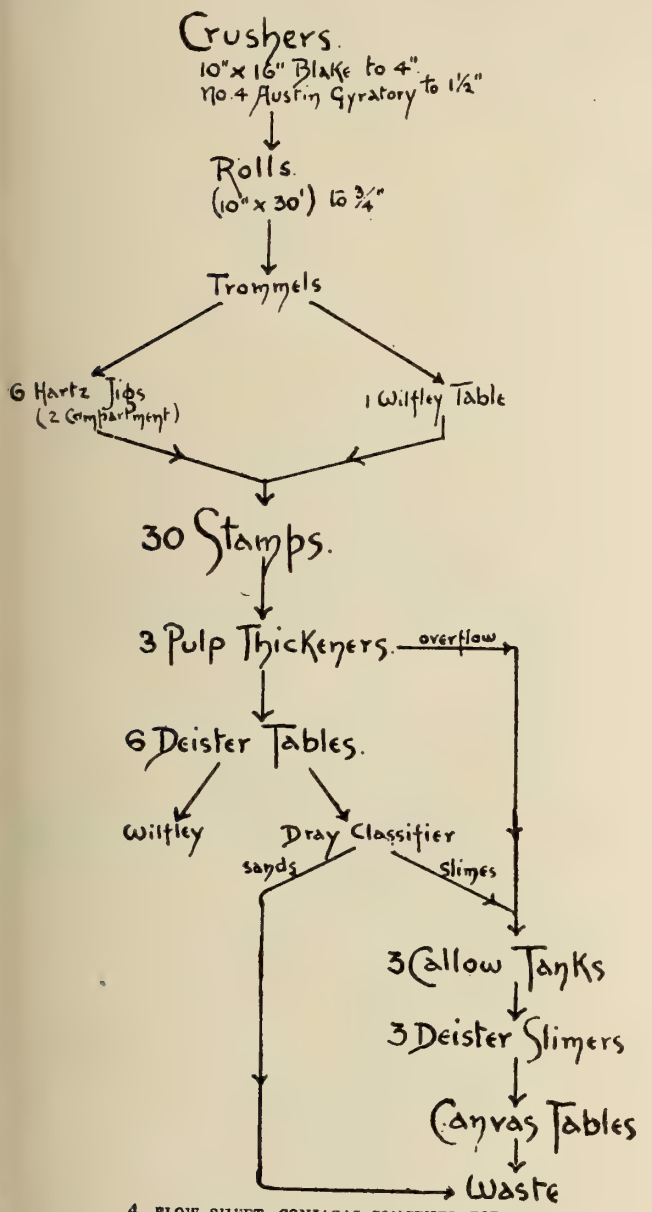
1. AMERICAN SMELTING & REFINING COMPANY, NEW YORK, U. S. A.

This company received both high and low grade ores from Cobalt, the former being treated at the Company's works at Perth Amboy, N.J., and most of the latter at Denver, Colorado.

The following is the schedule offered:

For ores assaying 1,000 ounces or over per ton.

Silver.—Pay for 94 per cent. of the silver contents at the New York quotations.



Treatment Charge.—$8 per ton of 2,000 pounds, dry weight, plus one-half cent on each ounce of silver contained.

Arsenic.—An addition to the working charge will be made at the rate of twenty-five cents per dry ton for each per cent. of arsenic in excess of five per cent. Sampling free.

Payment.—30 days after agreement of assays. For ore under 1,000 ounces and over 60 ounces per ton:

Silver.—Payment for 94 per cent. of the silver contents at the New York quotations.

Treatment Charge.—$8 per ton of 2,000 pounds, dry weight.

4. FLOW SHEET, CONIAGAS CONCENTRATOR.

Arsenic.—An addition to the working charge will be made at the rate of 25 cents per dry ton, for each per cent. of arsenic in excess of 5 per cent.

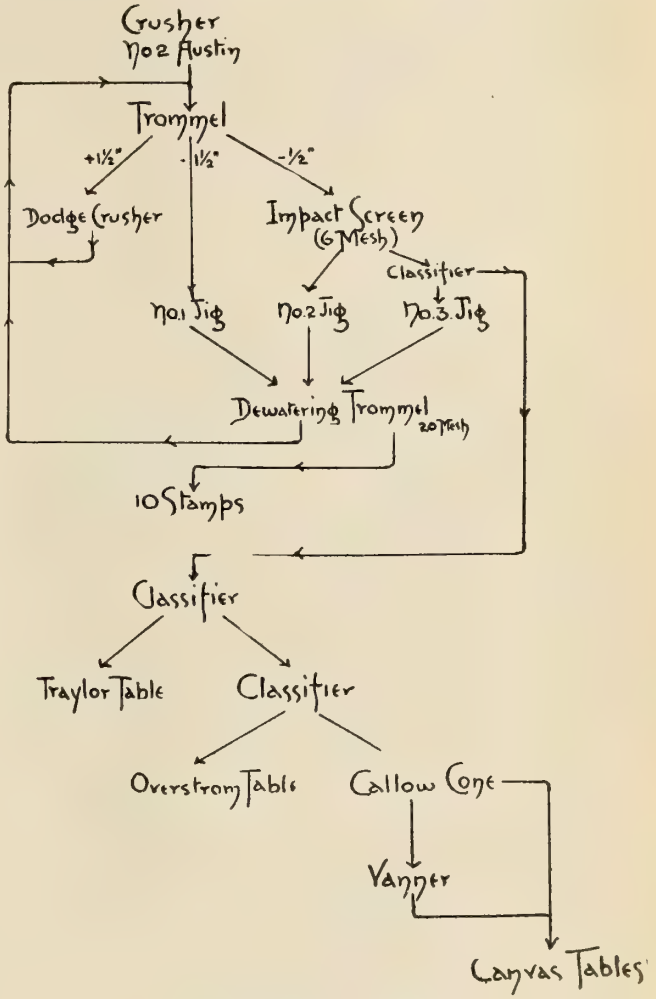
Payment.—Forty-five days after date of sampling.

If a mine is willing to contract for a total year's output, or 1,000 tons, the following schedule is offered:

For ores under 1,000 ounces and over 60 ounces:

Silver.—Pay for 95 per cent. of the silver contents, at the New York quotations.

Treatment Charge.—$7 per ton of 2,000 pounds, dry weight.



No payment for cobalt or nickel.

No penalties for insoluble.

Arsenic.—An addition to the working charge will be made at the rate of twenty-five cents per dry ton for each per cent. of arsenic in excess of 5 per cent.

Payment.—Payment forty-five days after agreement of assays.

The average freight from Cobalt to Perth Amboy is $9.20 per ton, and from Cobalt to Denver, $12 per ton.

5. FLOW SHEET, KING EDWARD CONCENTRATOR

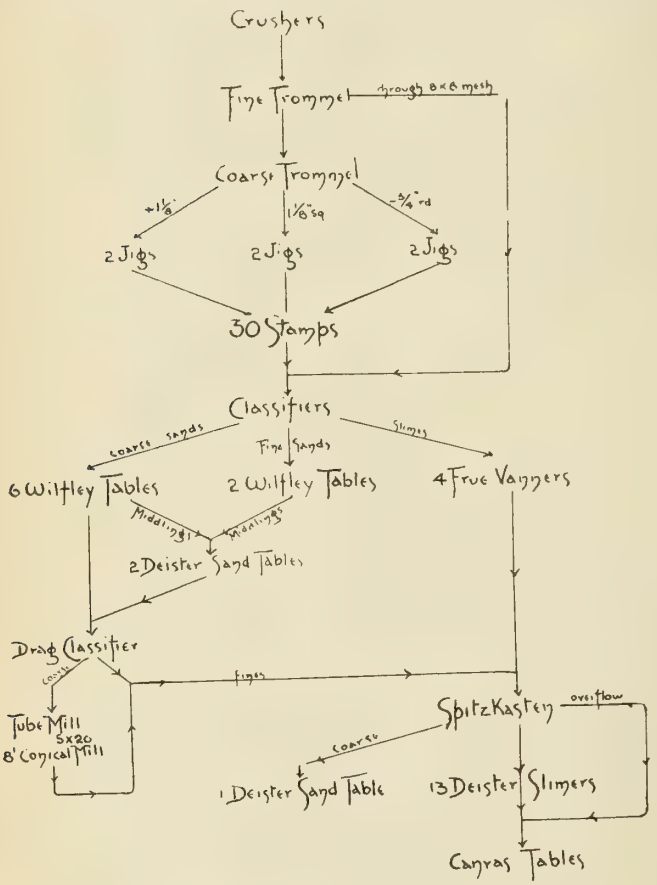
2. BALBACH SMELTING & REFINING COMPANY, NEWARK, N.J., U. S. A.

This company is buying high grade silver ore from Cobalt at the following rates:

Pay for the ores thirty days after agreement of assays and at the silver quotation on date of payment.

Penalties.—Forty-five cents for each per cent. of arsenic in excess of 6 per cent., and 6 cents for each per cent. of insoluble in excess of iron.

Ores over 1,000 ounces to 1,500 ounces pay for 93½ per cent. of the silver contents and a smelting charge of $4 per ton of ore, with penalties as above.



Ores above 1,500 ounces to 2,000 ounces pay for 93½ per cent. of the silver contents, and a smelting charge of $20.00 per ton of ore, with penalties as above.

Ores over 2,000 ounces silver per ton, pay for 93½ per cent. of the silver contents and a smelting charge of $19 per ton of ore, with penalties as above.

3. Beer, Sondheimer & Company, Frankfort-on-Main, Germany and New York.

High grade silver ore is bought for this company as follows:

Pay for 94 to 95 per cent. of the silver contents.
Smelting charge, $30 per ton.
No refining charge,
Ore to be delivered at New York.

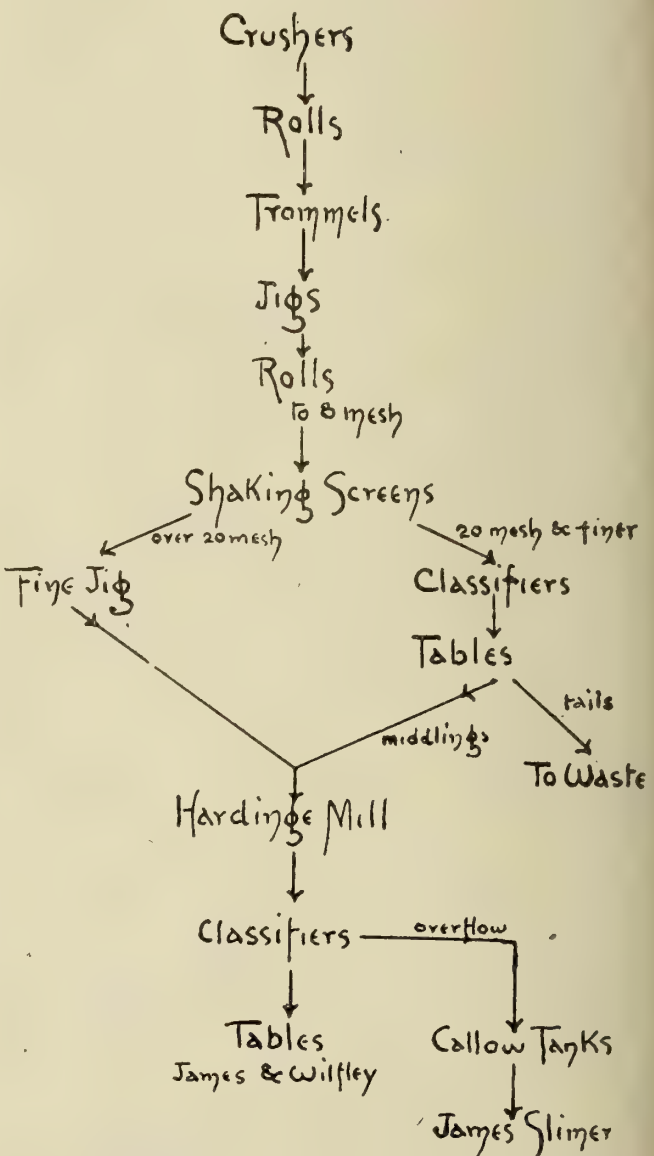
6. FLOW SHEET. M'KINLEY-DARRAGH CONCENTRATROR.

4. Canadian Copper Company, Copper Cliff, Ontario, Canada.

All purchases of Cobalt ore are made through the Orford Copper Company, of New York. The purchasing schedule is as follows:

Purchaser to make payment for

75%	silver	per	ton,	when	same	assays	100 oz. and over.
84%	"	"	(2,000 lbs.)	"	200	"	
86%	"	"	"	"	300	"	
87%	"	"	"	"	400	"	
89%	"	"	"	"	500	"	
90%	"	"	"	"	600	"	
92%	"	"	"	"	800	"	
93%	"	"	"	"	1,000	"	
93¼%	"	"	"	"	1,300	"	
93½%	"	"	"	"	1,600	"	
94½%	"	"	"	"	2,000	"	
94¾%	"	"	"	"	3,000	"	



Purchaser to make payment of

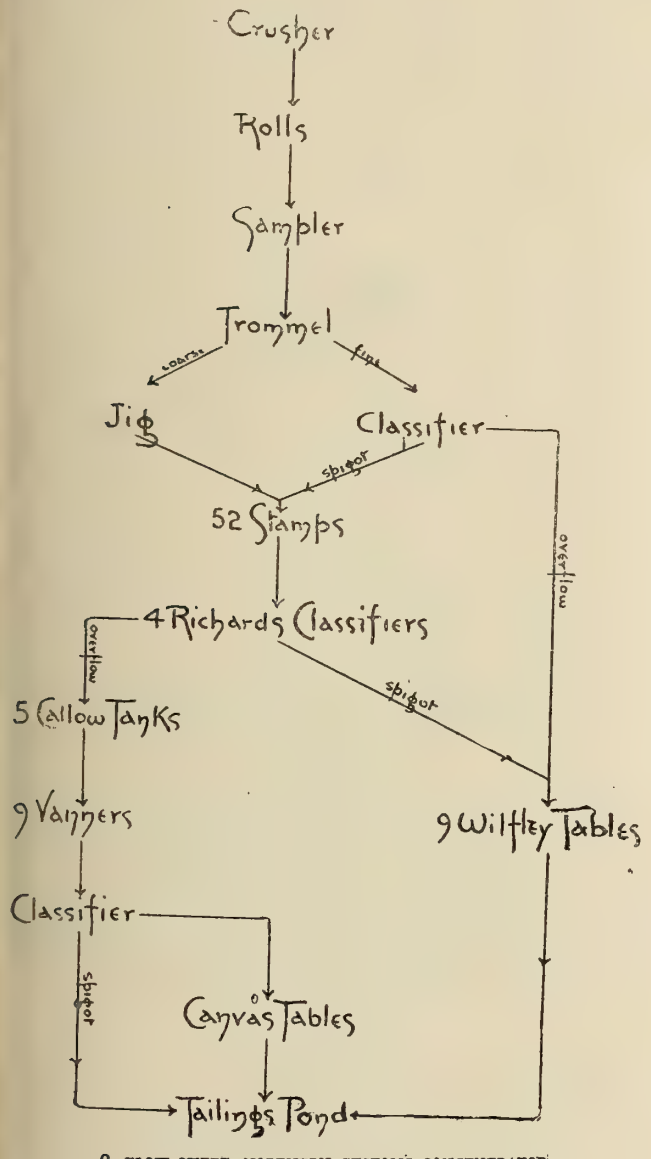
$10.00	per	ton	when	same	contains	6%	cobalt and over.
$20.00	"	"	"	"	8%	"	"
$30.00	"	"	"	"	12%	"	"

No payment will be made for cobalt in ores containing less than 6 per cent. cobalt, nor in which the nickel contents are higher than the cobalt contents. Further, purchaser reserves the right, to return at shipper's expense, any such ores (i.e., nickel contents higher than cobalt contents) received at Copper Cliff.

Ore to be delivered by seller to the Canadian Copper Company, f.o.b. cars, Copper Cliff, Ontario. Ore to be at shipper's risk until sampling is undertaken, as purchaser can assume no responsibility for the ore until same has been taken into its sampler.

Purchaser to sample at its expense, purchaser's and seller's representatives to be present. Assays to be made by Ledoux & Company, of New York, at seller's expense, which assays are to govern in settlement.

7. FLOW SHEET. NIPISSING REDUCTION CONCENTRATOR.



Payment for 70 per cent. of the silver returnable to the seller, as per the above scale to be made at the New York official price for silver on the first settlement date, which shall be thirty-five days after the date of which sampling of the ore is completed, and the balance 30 per cent. on the second settlement date at the New York official price of silver on that date, which shall be 90 days after sampling of the ore is completed. The purchaser, however, reserves the right to deliver upon either or both of the settlement dates above specified in lieu of cash, at its option, such silver bullion (commercial bar silver)

as is due the seller in settlement upon these dates, such delivery to be made in New York City.

Payment for cobalt will be made as per the above scale when the cobalt content of the ore comes within the specifications mentioned, settlement for same to be made on the first due date for silver, namely, in 35 days after completion of sampling of ore.

Purchaser has named a rate of 75 per cent. silver returnable to the shipper on ore running from 100 to 200 ounces per ton of 2,000 pounds. This is to be considered as a penalty clause and to apply only in such cases where ores under 200 ounces have been shipped by mistake.

Purchaser does not agree to accept regular shipments of ore which run less than 200 ounces of silver per ton of 2,000 pounds.

8. FLOW SHEET, NORTHERN CUSTOMS CONCENTRATOR.

5. The Coniagas Reduction Company, Limited, St. Catharines, Ont.

The above company will purchase cobalt and silver ores on the following schedule:

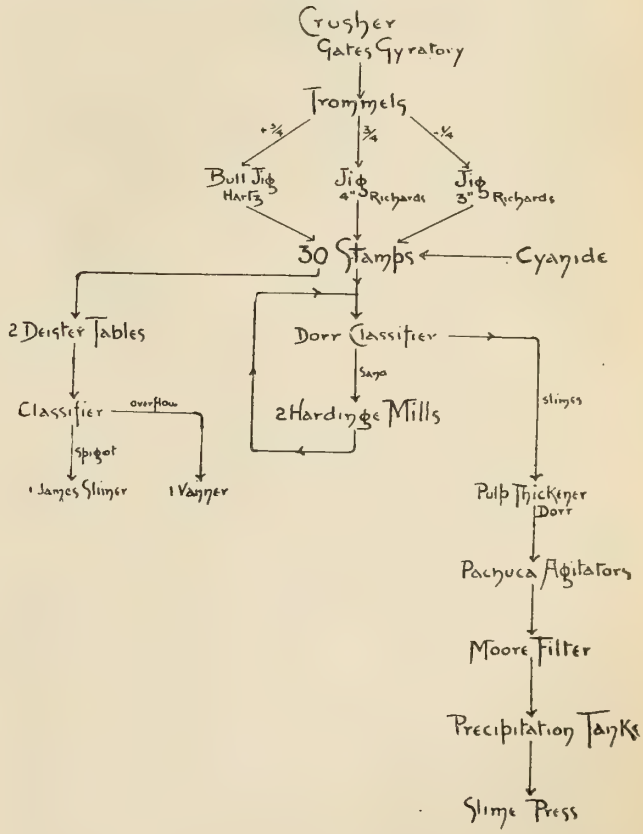
Will pay for:—

75%	of silver contents	assaying	over 20 ozs.	
84%	"	"	"	200 "
86%	"	"	"	300 "
89%	"	"	"	500 "
91%	"	"	"	750 "
93%	"	"	"	1,000 "
93½%	"	"	"	1,500 "
94½%	"	"	"	2,000 "
95%	"	"	"	3,000 "

Ores containing less than 100 ounces per ton are subject to a treatment charge of $10 per ton of 2,000 pounds, unless ore contains 12 per cent. or over of nickel and cobalt combined.

Terms of Payment for Silver.—75 per cent. of net proceeds at New York quotations 30 days after completion of sampling.

25 per cent. of net proceeds at New York quotations 90 days after completion of sampling.



For cobalt.

Pay	8c	per lb.	of	cobalt	when	ores assay	6%	or more.
"	10c	"	"	"	"	"	8%	"
"	12c	"	"	"	"	"	10%	"

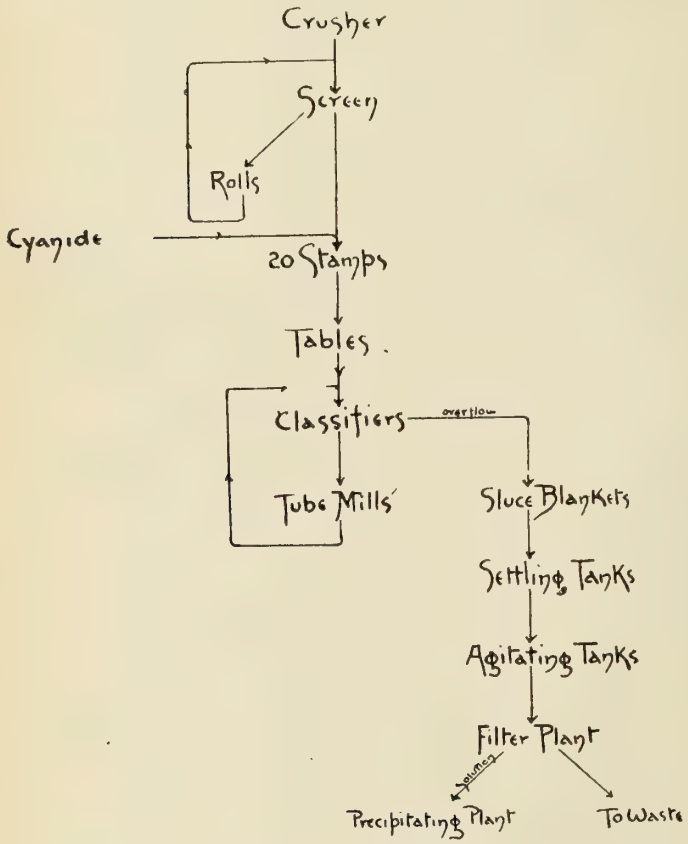
No pay for cobalt when ore assays less than 6 per cent.

Payment for cobalt to be made ninety days (90) after completion of sampling, which will be carried out without unnecessary delay on receipt of the ore. Ore to be delivered F.O.B. Thorold Smelter, via G.T.R., in carload lots. Ore to be at shipper's risk until sampling is undertaken. Sampling at Coniagas Reduction Company's works at buyer's expense. Sellers to have representatives present during sampling and weighing. Weights to be taken after milling.

Above terms subject to change without notice.

9 FLOW SHEET, O'BRIEN CONCENTRATOR.

6. Deloro Mining & Reduction Company, Deloro, Ont.



Tariff on Cobalt Silver Ores and Concentrates:

Silver.—Pay for 98 per cent. of silver contents.

Treatment Charge.—$20 per ton of ore and a refining charge of one cent per ounce of silver contained.

Terms of Payment.—75 per cent. of net proceeds at New York quotation 30 days after completion of sampling; 25 per cent. of net proceeds at New York quotation 90 days after completion of sampling.

Cobalt.—On ore containing 6 per cent. and over, 10 cents per pound for cobalt contained. No payment will be made for cobalt in ores containing more nickel than cobalt. Payment for cobalt to be made with the second payment for silver. Ledoux & Company's assays accepted with the usual provisions as to umpire assays in case of unusual differences. Above assays to be made at shipper's expense. No charge for sampling. Ore to be delivered in carload lots F.O.B., Marmora Station, C.O.R. This tariff is subject to change without notice.

10. FLOW SHEET, NOVA SCOTIA CONCENTRATOR.

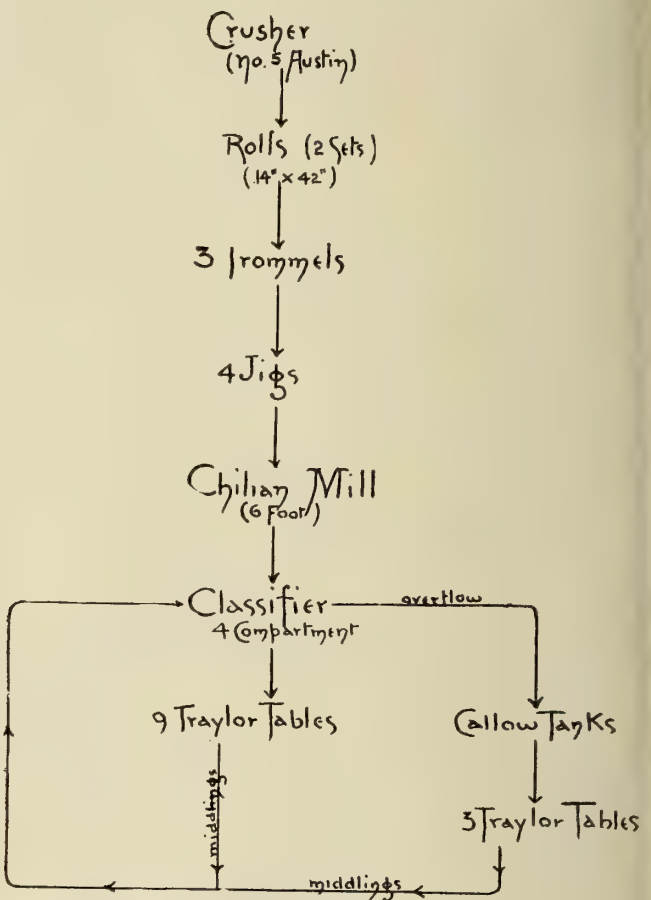
7. Pennsylvania Smelting Company, Pittsburg, Pa., Works at Carnegie, U.S.A.

The Pennsylvania Smelting Company buys ore from Cobalt ranging from 50 ounces to 500 ounces per ton, on the following schedule:

Silver.—Pay for 95 per cent., less one cent per ounce.

Treatment Charge.—Eight dollars per ton. Settling price, average for 20 days following date of arrival. No payment for cobalt or nickel. In some cases arsenic is penalized.

Special contract prices a little more advantageous to the shipper than the regular schedule are offered for the entire output of a mine, or for a definite tonnage.



This company is also coming into the market for high-grade ores.

8. Quirk, Barton & Company, London, England.

A contract was made for the buying of a limited amount of cobalt ores from one of the mines of Cobalt, but this was of a private nature, and no general schedule has been issued. At the present time they are not in the market, as the contract they have takes all their capacity.

9. United States Metals Refining Co., New York, Works at Chrome, N.J.

The silver ores from Cobalt that are being purchased by this company are comparatively low grade, the richest containing 400 ounces silver per ton. No regular schedule is published, but the prices vary with the character of the ore purchased .

11. FLOW SHEET, SILVER CLIFF CONCENTRATOR.

Concentration.

Milling and wet concentration have now become a well established feature of the Cobalt Camp. There are now nine mills operating in the district, with a maximum daily capacity of 850 tons, while four more are under construction, which will add another 400 tons when running full. The following is a list of these mills, with their respective daily capacities, under full load:

Mill.	Capacity in tons.
1. Buffalo	150-
2. Cobalt Central (Standard Cobalt Mines)	100-110
3. Colonial	50
4. Coniagas	90
5. King Edward	36
6. McKinley-Darragh	120-140
7. Nipissing Reduction	75
8. Northern Customs	140
9. O'Brien	90
Under Construction—	
10. Nova Scotia	100
11. Silver Cliff	125
12. Temiskaming	75-80
13. Trethewey	100

The following is a statement of the concentration tonnage for the camp during 1909:

CONCENTRATION IN COBALT FOR 1909.

Mill.	Mines.	Ore milled Tons.	Concentrates Tons.	Concentration ratio.
1. Buffalo	Buffalo	27,875.0	507.00	55–1
2. Cobalt Central	Bailey	2,482.0	36.24	68–1
	Cobalt Central	21,272.0	362.40	59–1
	Crown Reserve	45.0	1.02	44–1
	Foster	547.0	10.20	54–1

	Trethewey	1,180.8	17.02	66–1
9. O'Brien	O'Brien	3,749.5	57.00	†
		126,421.3	3,241.50	* 39–1

† No comparative ratio can be stated for O'Brien, as all low grade Concentrates were cyanided and yielded 12,656 ounces, which were shipped as bullion.
* The O'Brien is omitted from this ratio.

Comparing the above table with that of 1908, a marked advance is noted.

Year.	Ore Milled.	Concentrates.	Ratio
1908	49,424.0	1,093.85	45—1
1909	126,421.3	3,241.50	39—1
Totals	175.843.3	4,335.35	

The mines without mills do a certain amount of concentration by hand-picking, etc., and in the case of the Crown Reserve and Hudson Bay mines, coarse jigging is employed.

The Buffalo Mining Company is now operating the cyanide part of the mill, and at the O'Brien mill cyaniding is one of the principal features. As a result of this these companies ship out a certain amount of silver bullion as well as raw concentrates.

A certain amount of ore was treated by wet concentration by the Montreal Reduction & Smelting Company of Canada at Trout Mills.

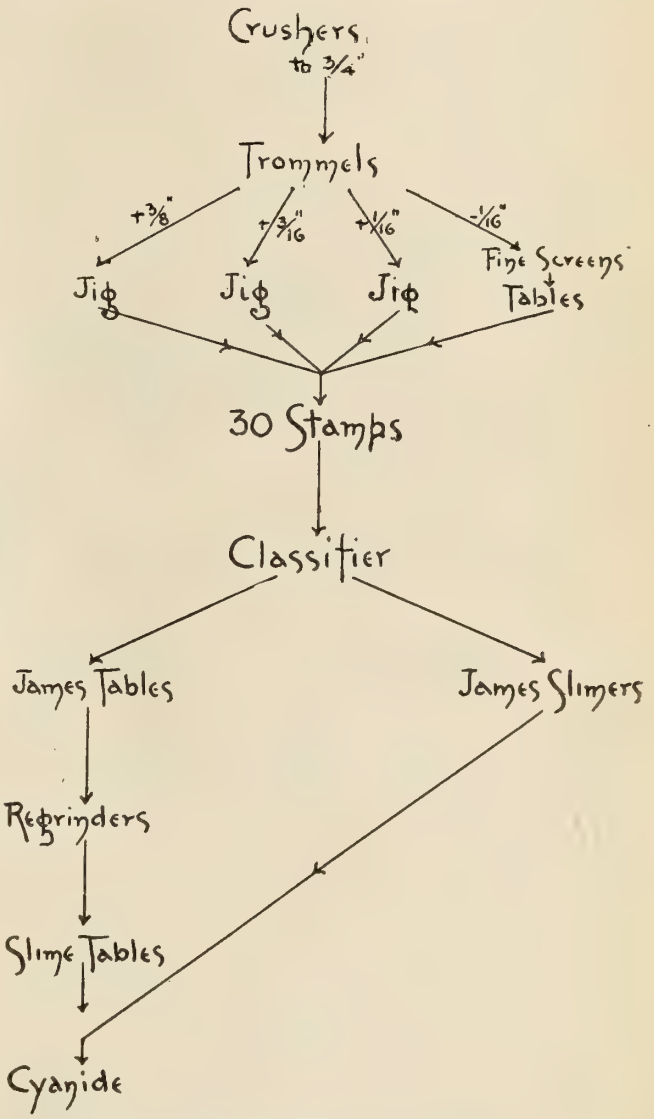
The following are the rates offered by the custom mills in the camp for treating ores:

NORTHERN CUSTOMS CONCENTRATOR, LIMITED.

Tariff.—On ore yielding less than 20 ounces silver per ton crushed, retain 10 ounces and return balance to the mining company with 50 per cent. of other metals that can be sold.

20 to 35	ounces	silver,	pay	50	per cent.
35 to 50	"	"	"	55	"
50 to 70	"	"	"	60	"
70 to 90	"	"	"	65	"
90 to 110	"	"	"	70	"
110 to 125	"	"	"	75	"

Ore will also be treated on the tonnage basis of $4 per ton, ore to be delivered at the mill and concentrates delivered to owners, in their sacks, dried and loaded on cars.



THE STANDARD COBALT MINES, LIMITED (Cobalt Central).

Makes the following schedule for milling ore:

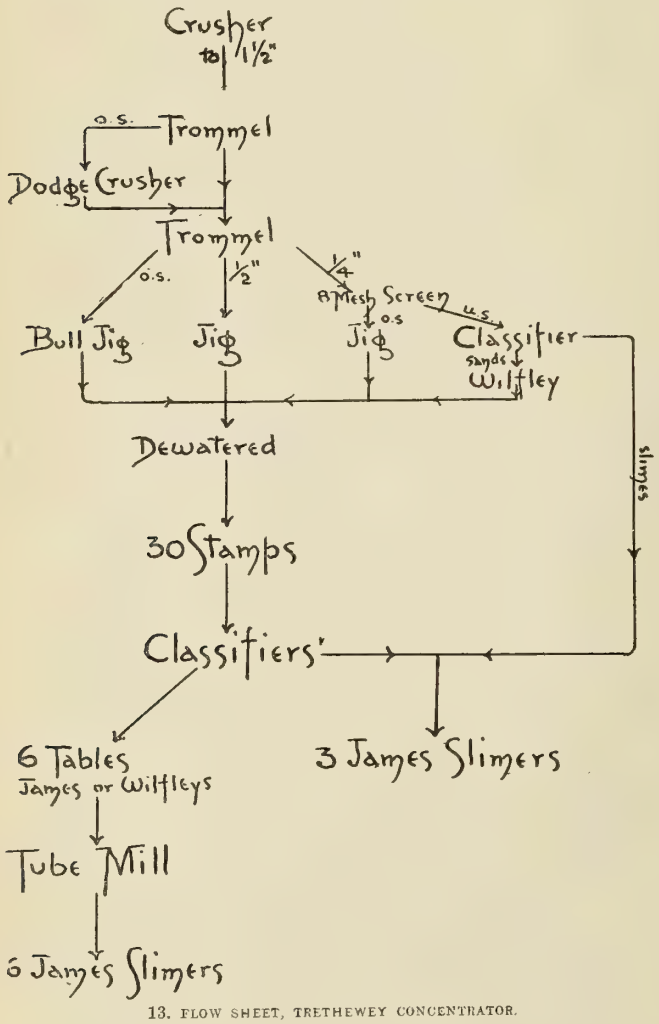
Ore on dump running 30 ounces or better, 50 per cent. of the product from concentration.

Ore	60	oz. and under	80	oz.,	55	per cent.	of product.
"	80	" "	100	"	63	"	"
"	100	" "	125	"	70	"	"
"	125	" "	150	"	77	"	"
"	150	" "	200	"	82	"	"
"	200	" "	250	"	85	"	"

The above company pays all charges of hauling and milling of ore, and will deliver at its mill the percentage of product due the mine furnishing the ore.

12. FLOW SHEET, TEMISKAMING CONCENTRATOR.

The Nipissing Reduction Company has not at present a fixed tariff for treating ore, but varies the rates to suit conditions and the nature of the ore.



The Montreal Reduction & Smelting Company of Canada at Trout Mills, Ontario, treated ores by wet concentration on the following schedule after the 1st June, 1909:

Settlement to be made on the thirtieth day after the agreement upon the assays, and at the New York quotation price of silver on the day of settlement.

Ores to be delivered f.o.b. at Trout Mills.

Charge for treatment, $5 per ton.

Grade.	Percentage of assay paid.
Over 30 ounces	75 per cent.
" 70 "	76 "
" 80 "	78 "
" 90 "	80 "
" 100 "	82 "
" 110 "	83 "
" 120 "	84 "
" 130 "	85 "
" 140 "	86 "
" 150 "	87 "
From 180 to 200 ounces	88 "

13. FLOW SHEET, TRETHEWEY CONCENTRATOR.

Power Development.

At the commencement of mining operations at Cobalt the exceptionally rich outcrops of silver ore made it a very easy matter for a mine manager to keep his returns from shipments above his cost of production, even if this cost might have been unreasonably high. With deeper mining and a handling of higher tonnages of lower grade material, this state of affairs has altered. The mine managers, who are men of proven mining ability, are looking closely after their working costs and in this connection the cost of power production takes a prime position.

The boiler horsepower of the district is now about 11,000 horsepower.

Practically all the boilers represented in the above amount are burning coal, so that the daily consumption is a large one. The following table shows the coal received in Cobalt for the years 1908 and 1909:

1908.	Tons.
January	5,067
February	1,429
March	8,670
April	3,568
May	1,401
June	2,827
July	4,318
August	3,561
September	2,713
October	5,740
November	7,407
December	9,058
Totals	55,759

1909.	Tons.
January	7,687
February	8,136
March	10,173
April	9,930
May	5,771
June	4,102
July	5,677
August	5,060
September	6,173
October	9,007
November	14,957
December	18,743
Totals	105,416

Totals 1908	55,759 tons.
Totals 1909	105,416 "
Total	161,175

As all this coal is brought in from the United States, the cost of freight is higher than the original cost of the coal at point of loading on cars. The average cost of coal to the mines is about $5.50 per ton f.o.b. Cobalt.

The cost of power generation from coal in the camp is necessarily high, even in the most economical plants, and is particularly high in the smaller plants. In some plants it will run over $175 per horsepower per annum, and the average price will likely be over $150.

With this high cost of power production it was only natural that the great water powers in the vicinity of Cobalt should not long be unharnessed, and now three companies are installing plants and expect to be delivering power in Cobalt early in 1910.

These companies are:

1. Cobalt Hydraulic Power Company, Ragged Chutes, Montreal River.

2. Cobalt Power Company, Hound Chute, Montreal River.

3. Mines Power Limited, Matabitchouan River.

Leases.

Of the mining companies leasing mining property from the T. & N. O. Ry., four made shipments during 1909. The following statement shows the amount paid by these four companies in royalties to the T. & N. O. Ry. Commission from the time the leases were granted to the 31st December, 1909:

City of Cobalt Mining Company	$87,251.24
Cobalt Townsite Mining Company	16,972.35
Nancy Helen Mines, Limited	1,640.27
Right of Way Mining Company	204,392.82
Total	$310,256.68

On the other T. & N. O. Ry. leases a certain amount of prospecting work has been done, but with rather indifferent success.

Outlying Districts.

Silver.—During 1909 a large amount of prospecting and development work has been done throughout the silver belt of which Cobalt is a part. Several shipments of high-grade ore have been made from the South Lorrain District, and small shipments have gone from Maple Mountain and Gowganda. At Elk Lake and Gowganda a certain amount of rich ore is now ready for shipment.

The following are the shipments to the end of 1909.

District.	Mine.	Date.	Tons.	Total.
South Lorrain	Keeley Mine	June, 1908	12.50	
		Dec., 1908	30.75	
		Feb. 1909	1.09	44.34
	Wettlaufer	Sept., 1909	25.00	
		Nov., 1909	29.90	
		Dec., 1909	26.50	
		Dec., 1909	30.10	111.50
Maple Mountain	Canadian Silver Ores	Sept., 1909	6.50	6.50
Gow Ganda	Bartlett Mines	June, 1909	2.00	2.00
		Total		164.34

Gold.—For more than a year back prospectors have frequently been bringing in specimens of gold-bearing quartz from the region around Lake Abitibi and from the Townships of Beatty, Munro and Guibord to the east of Matheson, but it was not until late in the year 1909 when the gold finds in the Porcupine Lake District became known, that the public really became aroused and interested. The district is situated west of Matheson in Tisdale and Whitney and the adjoining townships.

Although hardly any development work has yet been done in the district, there seems to be reason to regard it as one of great promise.

The change in the Mining Law of the Province of Quebec, which becomes effective on the 1st January, 1910, is already awakening keener interest in the mining industry in that province, and it is likely that many prospectors will go into the country that will be thrown open. The natural route to follow to get into a large area of this practically unprospected country will be by the T. & N. O. Ry.

The plants treating copper ores by the Elmore vacuum process are eleven in number. These are treating low-grade copper ores alone in Austria, Africa, France, England, Wales, Hungary, Norway, Sweden and the Malay States. In practically every instance they are operating on a grade of copper ore which by ordinary methods of concentration would fail to yield any profit. Some of these plants have been in continuous operation for about three years, a distinct encouragement to owners of other low-grade mines to install similar plants.

CANADIAN IRON AND STEEL.

Written for the Canadian Mining Journal by Watson Griffin.

I.

Many attempts to manufacture iron and steel in Canada were made in early times, but they all ended in failure largely on account of lack of tariff protection. No country ever established a great iron and steel industry without government encouragement in the form of high tariff protection or bounties, or both combined. The United Kingdom had the highest kind of protection until it lead the world in iron production. The iron industries of the United States, Germany, France, and Belgium were all developed by means of very high protection continued for a long period. For many years Canada gave practically no protection to its iron and steel industries. In recent years there has been moderate protection supplemented by large bounties, and as a result iron and steel industries of considerable magnitude have developed.

The great increase in the production of both pig iron and steel since 1896 is shown by the quantities on which bounties were paid. The figures are as follows:—

Years ended.	Pig Iron. Quantity. Tons.	Pig Iron. Bounty. $	Steel. Quantity. Tons.	Steel. Bounty. $
June 30—1896	52,052	104,105	29,749	59,499
" 1897	33,254	66,509	8,683	17,366
" 1898	72,523	165,654	24,673	67,454
" 1899	76,496	187,954	23,342	74,644
" 1900	101,838	238,296	21,453	64,360
" 1901	150,339	351,259	33,352	100,058
" 1902	341,654	693,108	36,375	77,431
" 1903	321,191	666,001	260,668	729,102
" 1904	273,434	533,982	128,884	347,990
" 1905	386,719	624,667	300,421	676,318
" 1906	581,858	687,632	569,237	941,000
Mar. 31—1907	416,265	385,231	454,932	575,259
" 1908	686,780	863,817	661,940	1,092,201
" 1909	609,431	693,423	570,588	838,100
Totals	4,103,834	3,261,638	3,124,297	5,660,782

During the calendar year 1909 the Canadian production of pig iron amounted to 724,016 tons. For the ten years 1851-60 the total production of pig iron in the United States was 6,600,000 tons, an average of 660,000 tons annually, so that the present annual production of pig iron in Canada is greater than the average annual production of the United States during that period. In 1850 the United States had a population of 23,191,876, and in 1860 it was 31,443,321. Canada has at the present time about seven and a half million people.

No country can be industrially independent until it has iron and steel industries of sufficient capacity to supply its own wants. The need of government assistance in the early stages is due to many causes. There is no other industry that requires such a large initial outlay for plant. What would be considered an immense investment in starting almost any other industry is sufficient to construct only a small iron and steel plant. The successful operation of a plant constructed

at such great cost is dependent upon the economical assembling of the raw materials, iron ore, limestone, and fuel. The materials must be of at least passably good quality; they must be found in sufficient quantities; they must not be too far apart; and the cost of transportation must be low. The present methods of making iron and steel require much larger and much more expensive plants than those used during the early history of the industry in the United States, and the supplies of materials must be greater. Thus iron ore deposits that would have been sufficiently large to have justified the establishment of a small plant in their vicinity fifty years ago would be considered too limited for local utilization now. Often after very great expense in development work an ore bed is found to be too limited in extent to be of value. Very costly experiments must be made in using the different materials together. It is seldom that any two deposits of iron ore or limestone are exactly the same. Coal also varies in quality. The materials assembled at a newly established smelting centre may be just as good taken together as the materials used at some older smelting centre from which workmen come, but they require a different method of handling. For instance, in one locality the iron ore may be low in sulphur and the coal high in sulphur. Iron ores from different localities must often be mixed. Sometimes the iron ore contains a high percentage of limestone, so that comparatively little limestone need be added for flux. Sometimes the limestone used for flux contains a percentage of iron, and this may make it possible to use with it iron ores having a rather low percentage of iron. All these and many other variations in materials must be taken into consideration.

The conversion of the materials into iron and steel requires many skilled workmen. The industry being new to Canada, the workmen had to be brought from abroad until Canadians could be trained for the work. To induce these workmen to leave remunerative employment in old-established smelting centres it was necessary to offer them higher wages than they were getting at a time when wages were at the maximum. This made the scale of wages higher than at any of the old centres, and added enormously to the cost of production.

Men gathered together at a new plant from a number of different plants in foreign countries had to learn how to work together and how to make use of materials to which they were not accustomed. Many mistakes were made at first, even by experienced men who had been very successful at old-established works. Men coming from different works where varied materials were used had each their own theories as to what was wrong. Of course, all these difficulties were most manifest at the largest plant established in Canada, that of the Dominion Iron & Steel Company, and it required very great organizing ability to get everything into good working order.

Fortunately, Canada has now passed the most critical stage in the development of an iron industry. The work has become systematized, the workmen from other countries understand the new conditions, and a number of Canadians have already become skilled workmen, but higher protective duties or a continuance of bounties will be necessary for the establishment of the industry in the different provinces of Canada on a permanent basis. The bounties have been steadily decreasing, and this is the last year for such government aid unless a new arrangement is made. The unexpected abolition of the German surtax, coming at a time when the bounties have reached the minimum, exposes our iron and steel works to severe German competition.

In his budget speech December 14, 1909, Hon. Mr. Fielding made a statement showing the customs revenue collected at the ports of Sault Ste. Marie, Ont., Sydney, N.S., North Sydney, N.S., Sydney Mines, N.S., Glace Bay, N.S. New Glasgow N.S., and Hamilton, Ont., during the ten years 1890 to 1899, both inclusive, and for the ten years from 1900 to 1909, both inclusive, showing that in the latter period the customs revenue from these ports was over nine million dollars greater than in the former period. At all these ports, excepting Hamilton, nearly the whole increase was due to the establishment of iron and steel works, and at Hamilton a considerable portion of the increase was due to the same cause. Mr. Fielding did not mention Midland, Ont., Port Arthur, Ont., Deseronto, Ont., Radnor Forges, Que., and Londonderry, N.S., at all of which are blast furnaces and communities dependent upon them that have contributed largely to the customs revenue of Canada. Besides the direct payment of customs duties at the points where blast furnaces are located Mr. Fielding pointed out that the iron and steel companies and the communities dependent upon them purchased supplies largely in Toronto, Montreal, Quebec, St. John, Halifax and a number of other cities and towns of Canada, thus considerably increasing the customs revenue of these towns and cities. It is thus certain that as a direct result of the establishment of iron and steel industries in Canada the Government has received more revenue than has been paid out in bounties. In addition to the imported supplies purchased by the iron and steel companies and the communities dependent upon them, they have purchased vast quantities of goods made in Canada, upon which no duties were paid, thus indirectly giving extra employment to work-people throughout the country, stimulating every branch of trade and creating a large home market for Canadian farm products.

The value of the iron and steel produced was enormously greater than the bounties paid, and but for the establishment of iron and steel industries in Canada, an immense amount of money would have been sent out of the country to purchase iron and steel. By keeping these vast amounts of money in circulation at home instead of in foreign countries these industries contribute to the prosperity of every section of the community.

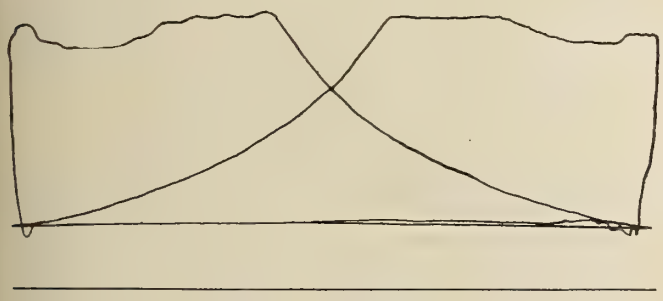
There are at present eight Canadian companies having blast furnaces, viz., the Dominion Iron & Steel Company, the Nova Scotia Steel & Coal Company, the Londonderry Iron & Mining Company, the Canadian Iron Corporation, the Algoma Steel Company, the Hamilton Steel & Iron Company, the Atikokan Iron Company, and the Deseronto Iron Company. There are four companies which have steel plants but no blast furnaces, viz., the Montreal Steel Works, Ltd., Montreal, the William Kennedy Sons, Ltd., Owen Sound, Ont., the Ottawa Steel Castings Company, Ltd., Ottawa, and the Ontario Iron & Steel Company, Ltd., Welland, Ont.

In future articles I shall describe the plants of the different Canadian iron and steel companies, the location of their raw materials, and their position as regards the home and foreign markets, discussing also the possibilities of future development of iron and steel industries in the various provinces of the Dominion.

STEAM-DRIVEN AIR COMPRESSORS IN COBALT.

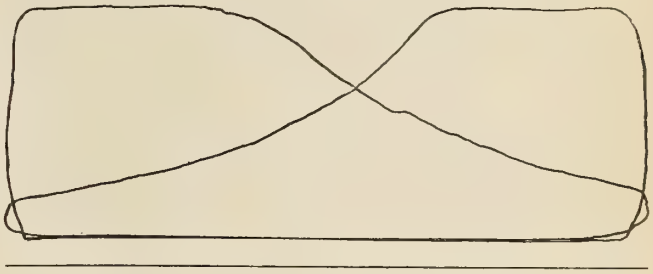
Written for the Canadian Mining Journal by H. V. Haight.*

The article in the Canadian Mining Journal for February on "Costs of Producing Compressed Air in a Canadian Mining Camp," by Richard L. Webb, is very interesting. Mr. Webb has certainly made extensive investigations of the cost of compressed air, from which we may, with care, draw valuable conclusions.



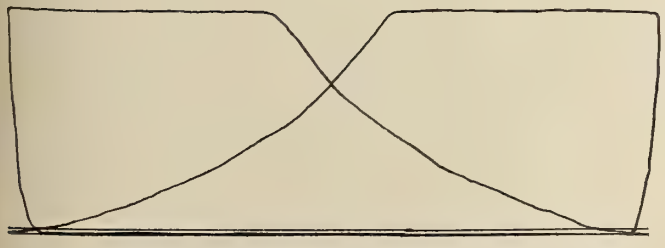
In justice to your readers, Mr. Webb should have explained that he was till lately in the employ of the Cobalt Hydraulic Company, which company is installing a hydraulic air compressing plant on the Taylor system to supply compressed air to sell at retail to the Cobalt mines, and that the information contained in his article was gathered while in their service. This would have enabled your readers to have appreciated Mr. Webb's point of view and the reason of gathering such information.

Mr. Webb has referred to many efficiencies, mechanical, volumetric, adiabatic, over-all and commercial. The point of greatest interest to the mine management is usually the commercial efficiency. This is hard to define exactly, but it is contained in the answers to the questions, Is the machine a profitable investment? Would some other machine be a more profitable investment? In regard to the first question there can be no doubt; compressed air for mining is cheap at any price, and any compressor is a profitable investment. This is indicated in Mr. Webb's paper where he says: "Many owners will not allow a plant to be shut down for repairs so long as it will turn over."

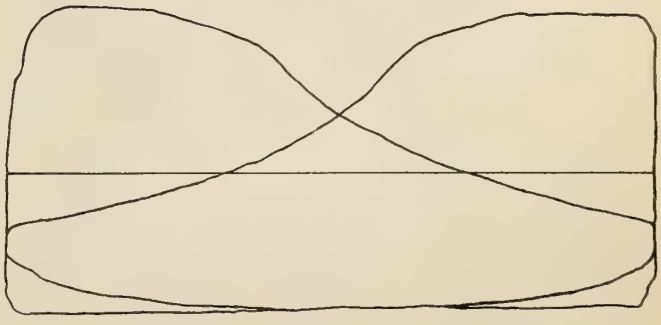


The second question opens up a large field. The cost of compressed air may be divided roughly into capital cost and operating costs. These will vary widely with the type of machine and equipment; when the capital cost is low, the operating cost is high, and vice-versa, and it is a nice problem for the mine manager to strike a proper balance between them. The usual stages of development of a compressed air mining plant are as follows:—

(1) A prospecting plant, usually a three to five drill straight-line compressor. It runs non-condensing with 80 pounds steam. This is low in first cost, easy to transport over the rough new roads, easy to erect, requires little foundation, and can be run by unskilled men, as it is nearly "fool-proof." The fact that its steam consumption is high is a minor consideration, for if the mine turns out well there will be lots of money later to buy a compressor which will take less fuel, while if the mine doesn't turn out well, no money will have been wasted on an expensive plant.



(2) The second stage in the mining plant is usually a duplex machine of ten to fifteen drill capacity, for thoroughly developing the mine. These machines usually have compound air cylinders and either simple or compound Meyer steam cylinders. The steam pressure is usually about 100 pounds, and some of them run condensing. The mine managers often exercise a false economy at this stage in buying a machine with simple steam cylinders instead of compound. With a duplex



H.P. Air 22x48 80 R.P.M. 60 Spring

H.P. Steam 22x48 75 R.P.M. 60 Spring

L.P. Air 36x48 80 R.P.M. 20 Spring.

L.P. Steam 40x48 80 R.P.M. 12 Spring

INDICATOR CARDS FROM RAND COMPRESSOR.

22 & 40 x 48 Steam. 100 lbs. Boiler Pressure—Condensing. 36 & 22 x 48 Air. 100 lbs. Air Pressure.

Crows Nest Pass Coal Co., Michel, B. C. Cards taken by T. Truran, Master Mechanic, Oct. 1909.

machine, which must have two steam cylinders anyway, the extra cost of compound steam cylinders is less than ten per cent. of the cost of the machine, while the fuel saving is very large. This is shown in Mr. Webb's paper where compressor No. 1, which had simple steam cylinders, took fifty per cent. more steam than compressor No. 2, which had compound steam cylinders.

The final stage or permanent mining plants are usually of 20 to 40 drill capacity, and driven either by electric power from a hydraulic plant, or by cross-compound Corliss steam cylinders, running condensing with 125 to 150 pounds steam pressure.

At each of these stages the air compressor will usually show the lowest fuel consumption of the power generators of the plant. Take hoisting and lighting, for instance. The prospecting plant, with the straight-line compressor, will have a small steam-driven hoist, with plain slide valves, and the steam consumption per average indicated horsepower will probably be fifty to one hundred per cent. greater than in the air compressor. The lighting will be by candles and kerosene, of which the fuel consumption is remarkably high for the small amount of light produced. If the air compressor is "one of the most wasteful machines ever employed," words fail to describe the wastefulness of steam hoists and candles.

In the development plant, the compressor will, or should, have cross-compound Meyer steam cylinders; the electric light engine will be a simple high-speed single-valve engine, and the hoist will be a geared hoist with simple steam cylinders, plain slide valves and perhaps link motion. The air compressor is still much the lowest in steam consumption.

Taking the highest type of steam plant, we find the compressor having cross-compound Corliss steam cylinders, running condensing. The electric generator will likely be a tandem compound single-valve engine, but in rare cases may be of the same high class as the compressor. The hoist will be of the first motion type, but still with simple non-condensing steam cylinders, although there will likely be link motion or even automatic cut-off on the steam valves. The steam consumption of the generator may in this case approach that of the compressor, but the hoist will still take many times as much steam per horsepower.

To illustrate this latter stage of development, note the indicator cards shown herewith, taken from a large Corliss compressor recently installed by the Crow's Nest Pass Coal Co. These were taken by the master mechanic at the mine, and while some small improvements might be made in the valve setting, they represent what may be expected of a good compressor in good hands. These cards speak for themselves.

The fact is that each type of plant, the prospecting plant, the development and the permanent plant, is suitable for its own conditions, and is not suitable for either of the other conditions. Cobalt was chiefly in the development stage. The mine managers who put in machines with simple steam cylinders, where the extra cost of compound steam cylinders would have been saved in a month's fuel, did not exercise the best judgment; neither did those who put in expensive Corliss steam-driven machines, which are already nearly obsolete. The third stage in Cobalt is hydraulic power, and it is nearly there, but it should not be overlooked that in the meantime Cobalt mines have paid thirteen million dollars in dividends by the aid of the "wasteful" steam-driven plants.

Referring for a moment to the tests themselves, they are open to criticism in several points, such as the absence of steam pressure readings, and the fact that in each test there is a mistake in the air cylinder sizes (14" for 22" in one case and 14" for 18" in the other case), but I wish to refer only to one point. The second machine was tested when the crank shaft was in such bad shape that over 38 per cent. of the power was lost in friction, and yet this is considered a sufficiently valuable test to publish. Would a test of a three-phase motor with one lead disconnected be considered typical of motors? An electric motor with the bearings in such bad shape would soon be disabled with either burnt coils or babbitt run out of the bearings. Must a compressor be blamed as an extremely wasteful machine because it will continue to do its work under adverse conditions, where another machine would quit? Which is the more profitable miner, a man who demands fifty cents a day more to work in a wet shaft, or a man who gets sick when he gets his feet wet?

But let us see what are some of the lessons to be learned from Mr. Webb's tests and from the experience of the Cobalt camp generally in the matter of air compressors. They might be summed up in a few sentences.

1. Any air compressor is a good investment, or "commercially efficient."

2. Each type of plant is suitable for certain conditions; for prospecting, the simple straight-line compressor; for development, the cross-compound Meyer compressor; for a permanent plant, the cross-compound Corliss or the power-driven if water-power is available.

3. A duplex machine should always have compound steam cylinders.

4. The steam consumption of a cross-compound Meyer machine is very satisfactory. An average steam consumption from two-thirds load to full load running non-condensing and probably with low steam pressure, of 28 pounds per I.H.P. per hour, must be considered very good.

5. The speeds of air compressors are too low, and machines built for much higher piston speeds will show lower costs per cubic foot of air delivered.

6. All steam-driven compressors should be of a type which may readily be converted to power-driven when electric power becomes available, as it surely will.

*Chief Engineer, Canadian Rand Company, Limited.

CLAIMS ASSESSMENT WORK IN THE PROVINCE OF ONTARIO.

By James Rennie.*

Subsequent to the staking and recording of mining claims in Ontario, the assessment work required by the Mines Act is as follows:—

"(a) During the three months immediately following the recording, to the extent of thirty days of not less than eight hours per day.

"(b) During each of the first and second years following the expiration of such three months to the extent of sixty days of not less than eight hours per day.

"(c) During the third year following the expiration of such three months to the extent of not less than ninety days of eight hours per day."

It will be observed that a very reasonable working day is called for, and no objection could be made by the prospector who has contracted to carry out the required number of days' assessment work for any

*Mining Engineer, New Liskeard, Ont.

owner, but there have been cases where objection could be taken to the amount of work executed in the time allowed.

It would be unfair to blame the prospector for the conditions under which these complaints have arisen. The objection usually occurs when the prospector has no retaining interest in the claim, but has simply contracted to do so many days' assessment work at either a lump sum or daily wage, the amount of work to be performed being left an open question between the owner and prospector.

— Statement of Assessment Work —

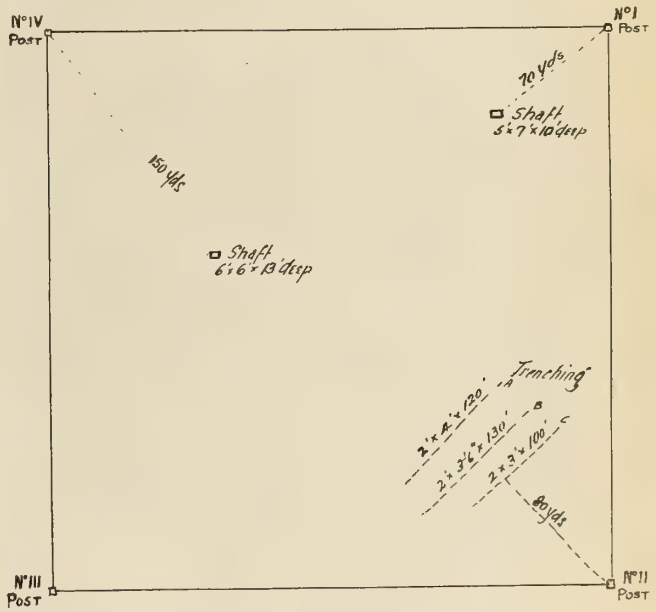
Date of Recording Work	Reference Letters on plan	Nature of Work done	Number of Days Work	Approximate amount of Work, by Average measurements Cubic Feet	Give name of Minerals found in place during the work as separately Stated
		Trenching			
		Stripping Overburden Soil etc			
		Rock opencutting			
		Shaft sinking			
		Adit Tunnels			
		Total			

-Note-

The amount of Work to be derived from approximate measurements, with the figures in average marked at the various parts of the work shown on plan and denoted by the reference letters.

When the owner of a claim is resident some distance from the district in which the claim is located, the prospector is usually called upon to record the assessment work on the owner's behalf at the recording office of the district. Here he states the nature of his work and the number of days in accordance with the Mines Act. These statements are sworn to under affidavit, but the amount or nature of the work executed is not called for. Nevertheless this is an important factor, and if some approximate idea of the actual work done, together with the location of such work, were shown upon a sketch plan and filed similarly to the sketch plan showing the position of the discovery post upon a mining claim, with the approximate measurements given, the additional data would no doubt be appreciated by all parties who are interested in prospecting work. The industrious prospector would at the same time appreciate the statement showing the amount and result, if only in approximation, of the number of days' assessment work he has done upon any claim.

This would also tend to eliminate the feckless prospector who sometimes spends a month or more of congenial camp life at the expense of the owner during a season of the year that prospecting can be carried out most expeditiously.



As suggested, some definition of the amount or quantity of work might be established under a common measure in conjunction with the number of days and nature of the work which would be advantageous to all interests.

The general sphere of prospecting work is known to those who take an active interest in mining and may be classified as follows: surface trenching, shipping over burden, soil, etc., rock open cutting, adit tunnels, and sinking of trial shafts.

One common measure could be taken for some of the above work namely the cubic contents, given by the average measurements of the work and stated in cubic feet. To arrive at this common measure of work done, the prospector would be called upon to take the average measurements in width, depth and length for the first three classes of work, for adit tunnels the average width, height and length, and for each shaft sunk the average breadth, length and depth. The figures representing the average linear measurement for each portion of the assessment work could be marked upon the sketch plan of claim with the approximate distance from the nearest corner post of the claim to the location of the respective portion of the assessment work.

Plan of Assessment Work on Claim N°.....

Referred to in Sheet N°.....

A suggested form of record is shown by the blank statement and plan appended, including the nature, time and quantity, and result of the prospector's work to a useful approximate degree of definition. The prospector or owner of a claim when recording his first portion of the assessment work might also state the rock formation and all the minerals found.

The information described, if placed on record, with reference given or abstract obtainable as desired, cannot but tend to promote the further development of claims by the record of the actual result from the prospector's pick.

The Broken Hill Proprietary Company, New South Wales, was incorporated twenty-five years ago. Its capital is £384,000, in 960,000 shares of 8s. each. Since incorporation £11,500,000 has been distributed in dividends.

THE EIGHT HOUR DAY IN NOVA SCOTIA.

A commission, appointed by the Government of Nova Scotia to enquire into hours of labour in that province, recently submitted a careful report. The section referring to the eight-hour day as applied to coal mines is particularly interesting. The commission, in a most unqualified manner, declared the eight-hour day to be an economic impossibility. Here is the formal opinion:—

"The investigation of the probable effects of a statutory limitation of the hours of labour in the industries of Nova Scotia is a difficult work, even when confined to the industries that are subject to the control of the Provincial Government. The commission undertook to work in sympathy with the effort to shorten the working day, believing that every humanitarian interest of the workers would be promoted by lessening the hours of manual toil. It is the first investigation of the kind attempted in Nova Scotia, and there were many difficulties in conducting it. They were difficulties arising from the lack of statistics, and the lack of detailed and accurate evidence on some of the most relevant subjects, from the fact that employers of labour had given little attention to the question, from the fact that labour organization is limited, and from the fact that there were controversies and strikes in the coal industry.

"The commission, however, believe that a general and compulsory provincial eight hour law would be at present a fatal blow to the industrial prospects of Nova Scotia. Such industries as fishing, farming and lumbering are not suitable for the legislation, and this applies also to dock and wharf labour and to shipping. The manufacturing industries would be put, by a merely provincial law, under great disadvantage in competing with those of the other provinces. An eight-hour law for any industry should be applicable to all the competing firms in that industry; but this condition could not be secured by a provincial law.

"So far as coal mining is concerned, the commission would gladly report in favour of the shorter day if the facts permitted them to do so. But the existing market for Nova Scotia coal presents features of a grave character. The coal industry is fundamental to the welfare of this province, and before enacting legislation which would undoubtedly add to the cost of operating the mines, or seriously reduce wages, further consideration should be given to the features referred to."

CORRESPONDENCE.

Fitzroy Harbor, Ont., Feb. 26th, 1910.

The Editor of the Canadian Mining Journal:

Sir,—In your issue of February 15th you attack, in a leading article, certain statements made by the Hon. Clifford Sifton before the Commission on the Conservation of Natural Resources.

As the recognized organ of the Canadian mining industry, it is of national importance that such leading articles as you may, from time to time, publish, shall be absolutely correct in fact, entirely impartial in tone, indeed like "Caesar's wife, above suspicion."

Certain of the statements made by Mr. Sifton and to which you object, had already been published in the report for 1909, issued by the Bureau of Mines of the Government of Ontario, Vol. xviii, Part 1, 18th Annual Report, which report should have been in your hands some weeks ago.

If these statements be wrong, and I cannot believe that they are, it is not against Mr. Sifton, nor against any Department of the Government of the Dominion of Canada, the vials of your wrath should have been poured forth, but against the Government of the Province of Ontario.

On page 10 of this report, it is stated "that so far as tonnage is concerned" "the bulk of the ore" "was exported to the United States" "as follows:"

	Tons	Per cent.
Canada,	7,401.14	29.18
Great Britain,	222.08	88
Germany,	229.46	1.18
United States,	17,439.42	68.67

On page 12, after naming the reduction plants then operating in Canada, the report states:—"Through these works there were passed an aggregate of 6,958 tons of ore, containing 11,658.008 ounces of silver, of which 8,972.958 fine ounces were recovered, the remainder, 2,685.050 ounces being contained in the speiss product reserved, **or exported for further treatment.**" Page 13, "The elements other than silver, in the ores of the Cobalt camp, **are at present of comparative little value, at any rate to the miners of the ore.**"

Such reports, if correct, justify any and every Canadian's desire to find processes by which the metals contained in Canadian ores may be recovered in Canada, and entirely justify the remarks made by the Honourable Clifford Sifton.

The unfortunate question of accidents you will find fully dealt with by Mr. Corkhill on pages 69-78 of this report. If you will refer also to page 14 of the same report where Mr. Gibson gives data as to the number of men employed underground in the Cobalt district, you will find that Mr. Sifton's statement as to the ratio per 1,000 employees of fatal accidents underground is in accord with the data given in this report.

I desire to think that with these explanations before you, there will be no hesitation on your part to make the "amende honorable" due under the circumstances from one honourable man to another. I am,

Yours truly,
LOUIS SIMPSON.

Editor the Canadian Mining Journal:

Sir,—A half-page advertisement of the Willow River Timber Company in the Toronto Globe of 2nd inst. includes the assertion that Fort George, in British Columbia, "is the centre of one of the largest and richest agricultural districts in the world, as well as being contiguous to one of the most extensive coal and mineral deposits in America."

May I point out that to date there has been little, if any, production on a commercial scale, from either the agricultural or the alleged mineral resources of the district surrounding Fort George, whatever may be its potentialities, which, though as yet unproved, may possibly be considerable. My particular purpose in writing to you now is to state that, so far as I am informed, there has not yet been done any large amount of development work such as would be necessary to determine whether or not there really does exist in the district above-mentioned "one of the most extensive coal and mineral deposits in America," neither has there been any production of coal or other mineral on a scale which would in even slight degree warrant such an assertion. I regard that assertion as a gross misstatement, and its being made in an advertisement designed to induce the public to buy shares in the company first

above named, to my mind constitutes an offence which should be punishable by law. I therefore suggest that the proper authorities in Ontario make the necessary inquiries and take such action as shall thereafter be deemed advisable.

Yours, etc.,

E. JACOBS.

Victoria, B.C., March 11, 1910.

PERSONAL AND GENERAL.

Mr. W. G. Miller has returned from a visit to Porcupine.

Mr. J. E. McAllister, general manager of the British Columbia Copper Company, is in New York.

Mr. R. W. Leonard is in England.

The Hon. C. R. Devlin, Minister of Mines for the Province of Quebec, has returned from Europe.

Mr. P. W. Lover, formerly superintendent of the Oro Denoro mine, at Summit camp, is now foreman at the Mother Lode mine, in the place of M. Edgren.

Mr. F. Hille, Port Arthur, was in Toronto on March 29th. Control of the Laurentian gold mine, which is soon to be put in operation, has been secured by Mr. Hille.

The Hardinge conical mill is invading the Orient. One mill was recently shipped to the Philippines, and another to New Zealand. The Mines Trials Committee has also ordered one for experimental purposes on the Rand.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

The Albion Mine Fire.—We understand that a Draeger apparatus was exhibited before the members of the Canadian Mining Institute at their Annual Meeting recently held in Toronto, but the members did not have the same opportunity of deciding on the utility of these devices as fell to the lot of several of the members of the Nova Scotia Mining Institute who attended the annual meeting at Halifax. One or two of these gentlemen who had evidently been looking forward to the annual relaxation for which the Nova Scotia Mining Society's annual dinner is justly renowned, were called to a fire in the Albion Mine at Stellarton, and although they missed hearing President T. J. Brown's jocular jeremiad—of which, more another time—they witnessed a very practical demonstration of the utility of oxygen breathing apparatus in fighting mine fires.

For some little time the Acadia Company has had trouble with a fire in the workings of the Albion Mine, which is supposed to have its origin in an abandoned upper seam that has been on fire for some years past. On the 12th of March the fire showed itself through a stopping at the foot of a "balance." The stopping was reinforced, but the fire made its way into the level and showed in the roof coal. Stoppings were commenced to isolate the district affected, but on the afternoon of the 15th the fire seemed to be making headway, and the work of building the stoppings became increasingly difficult through the heat and the fumes given off from the fire. Effective work upon the fire was out of the question, although two good streams of water were available, as it was impossible to get within working range of the fire with the hose. The assistance of the Draeger corps of the Dominion Coal Company and the Nova Scotia Steel & Coal Company was asked for about 3 p. m. In response the Dominion Coal Co. despatched seven experienced men with three apparatus and refills sufficient for eighteen hours' work. The Nova Scotia Steel Co. sent five men with four apparatus and refills, in charge of Mr. Robert Robson, a veteran of many mine fires. The combined corps arrived at Stellarton at midnight by special train, which thanks to the Intercolonial Railway officials, made very good time from Sydney. On arrival, the corps were met by Mr. John Johnson, of the Nova Scotia Steel Co., Mr. Blackwood, the Inspector of Mines for Pictou County, and Mr. Coll, the General Manager of the Acadia Company, and his assistants. The corps divided into two parties, and seven men immediately descended into the mine, getting to work about 2 a.m. They were able to get within close range of the fire and played the hose on the blaze until 7 a.m., when they were relieved by the party of five who had remained on the surface.

By noon of the 16th another stream of water was available with better pressure, and the fire was gradually got under control. At the time of writing—18th March—the work of confining the fire area within permanent dams is proceeding rapidly, and flooding will then be undertaken. While it cannot be said that the situation was beyond control when the Draeger corps were asked for, it is certain that their presence enabled the fire to be tackled effectively at short range, and rendered it possible to confine the flames within a much smaller area, as otherwise it would have been necessary to undertake much more extensive damming operations.

As only two streams could be used, the whole of the apparatus or the men was not necessary. The men relieved each other at intervals. There was good ventilation in the deep not more than 80 yards away, and the work was not by any means so strenuous as that done with the aid of the same apparatus at Sydney Mines in September 1908. In the case of this fire, as in many other mine fires, all that was needed was some means of enabling the fire-fighters to bring a stream of water to bear at a sufficiently short range to be effective.

A joint rescue station for the mainland mines of Nova Scotia has been under consideration for some time past. It is to be hoped that the scheme will now be proceeded with, as Cape Breton is rather a distant base of supply for the Nova Scotia mainland, and should a really serious fire or explosion occur in Pictou or Cumberland necessitating a prolonged fight, the Cape Breton collieries dare not denude themselves of their own apparatus and the necessary oxygen and potash refills beyond a certain limit. In the present instance, the Nova Scotia Steel Co. despatched their oxygen refill pump and a supply of oxygen, which they probably would not have been justified in doing had they not known that the Dominion Coal Co. also possessed a refill pump and oxygen stores. So far the Nova Scotian government has not granted any aid to the coal companies of the province in the matter of rescue stations, and it might be suggested that a little financial aid or recognition of the work that has been done by the coal companies, would be more appreciated by them than the present persistent persecution and baiting of our coal industry, which appears to be the favourite amusement of the Legislature, or certain members thereof.

Glace Bay.—During the first fortnight of March, the weather in Cape Breton was unusually mild and open, and there were none of the interruptions to production which the month of March generally brings with it. The outputs were large and shipping was carried along in Sydney Harbour as well as at less a task, and it is hardly likely that the proposal will com-

Louisburg. The mines of the Dominion Coal Company produced more coal than in any similar period since the strike. The output to the fifteenth was 125,000 tons, or at the rate of 250,000 for the month. The production for the six days ending the twelfth was 59,600, or very nearly a daily average of 10,000 tons. When it is remembered that the daily average of the Coal Company in July 1909, the first month of the strike, was only 4,600 tons, it should not be difficult to form a conclusion as to the effectiveness of the U. M. W. strike.

The troops which have been stationed at Glace Bay since the disorders in July last were withdrawn on the 3rd of March. The Coal Company have now a very efficient and numerous police force which will be quite adequate to guard the Company's property. The lessening of breaches of the peace must be attributed very largely to the salutary lesson administered at the last term of the Supreme Court in Sydney.

The attempt of the clergymen of the district to find acceptable terms of settlement, and to bring the strike to an end, came very nearly to success, but unfortunately it was not found possible actually to reach the desired conclusion. As a result of the efforts of the ministers a conference took place between Messrs. Butler and McDougall, the General Manager and the Assistant General Manager of the Dominion Coal Company., Mr. John C. Douglas, the Mayor of Glace Bay, the Rev. Dr. Thompson, Vicar-General of the Diocese of Antigonish, and two of the former employees of the Coal Company, who, it was understood, attended the conference in their individual capacities as men out of work and seeking employment. As a result of this conference the company reiterated their refusal to recognize the U. M. W. and offered to take back their former employees, without discrimination within thirty-five days, and as far as possible to reinstate them in their old positions. The company stated that any employee who had a just grievance had the right to present his complaint to his superior, with an ultimate right to appeal to the President of the Company if necessary. The statement further read that "for such purpose, the aggrieved employee may be accompanied by a committee of his fellow-workmen from the mine where the grievance is alleged to exist." The representatives of the U. M. W. wished to add conditions tantamount to complete recognition of their organization, whereupon the company withdrew their statement in its entirety, announcing that no further steps would be taken by them.

Since the new heads of the Dominion Coal Company took charge at the mines they have shown a spirit of reasonableness, and have evinced a desire to meet their former employees. The local President of the U. M. W. some time last summer wrote a long, open letter to the newspapers, the gist of which was the statement that the members of the U. M. W. on strike at Glace Bay did not insist on formal recognition, but would be content with an undertaking on the part of the company that the management would meet committees of its employees to consider and adjust grievances. Great publicity was given to this letter, and although the untruthfulness of its general tenor was pointed out at the time, a good deal of capital was made out of the fact that the Dominion Coal Company refused so reasonable a request as that to meet a committee of employees. Whoever counselled the men on strike to refuse the very liberal and honourable offer which was made by the management of the company in their desire to end a situation disastrous to all alike assumed a grave responsibility. The strike was always unnecessary, and those who called it were guilty of crime, but its continuance under present conditions is merely foolishness. The individual strikers are beginning to realize this, and the increasing outputs tell their own unmistakable tale.

Legislation.—As usual, the Nova Scotia Legislature is being asked to devote a large amount of its time to consideration of matters affecting the coal industry. These included the report of the Eight-Hour Commission, of which Dr. Magill was the chairman. This is said to be a valuable document, and from what we know of the painstaking nature of Dr. Magill's work on this Commission will repay careful reading and mature study. The report has not yet been distributed to the public, and we hope to refer to it in detail at a later date. It is sufficient to remark that the Commission were unable to recommend any statutory limitation of the present hours of work in Nova Scotian coal mines.

A government measure dealing with compensation to injured workmen, and the dependents of men fatally injured at work, was introduced, and if it should become law it will have a more important bearing on the mining industry than on any other. The proposed measure is practically a copy of the first enactment passed by the English Parliament, except that the maximum and minimum limits of compensation payable to relatives of those fatally injured are higher than provided by the British statute. The Nova Scotia statute provides for a period of two weeks' disability before compensation becomes payable, and for a minimum payment of $1,000 and a maximum of $2,000 to dependents. This matter also calls for comment in full, but space will not permit. There can be no valid objection to the principle of compensating those injured in their work, and it is but right that each industry should carry its own victims. The injustice of the measure proposed by the Nova Scotia Legislature and of the measure which is now the law in Britain, is that it places the entire onus on the employer, and relieves the employee of practically all responsibility for his own safety. The British Act has put a premium on malingering, and the general indefiniteness of the measure has given rise to endless litigation. It has killed the colliery relief societies, which once formed so large a part of the British workmen's interests. There is at present on the statute books of Nova Scotia, legislation, which may become effective upon proclamation, that is indefinitely preferable, both for the master and the man, so far as the coal industry is concerned, to the Compensation Act as known in Britain and Newfoundland. This legislation arose out of the work of the Commission appointed to enquire into the Relief Societies and an old age pension scheme for miners, and we know of no more provisions more likely to be of lasting benefit to coal mining and the workmen employed in this industry than is the legislation referred to.

The Compensation Act, and the legislation which provided for a consolidation of the colliery relief societies, the formation of a permanent fund for the relief of dependents, etc., cannot exist together. If the Compensation Act should become law the relief societies will die, and any old age pension scheme which might be formulated, will die also.

The report made by Mr. T. E. Forster of Newcastle-on-Tyne, on the submarine coal areas of Cape Breton and the proposed methods of extraction was laid on the table of the House, but so far no legislation has been proposed. There is no necessity for any further legislation on this matter, as it is within the power of the Commissioner of Mines to approve or otherwise of systems of coal extraction. It is quite impossible to frame legislation to cover matters which experience can only elucidate. What is the Commissioner of Mines appointed for if not to act as Commissioner?

Dr. Arthur Kendall again moved for a Commission to investigate the coal trade, root and branch, and delivered an exhaustive and forceful speech in the House in support of his contentions. Many of the evils pointed out by the member for South Cape Breton are only too apparent, but the remedies proposed seem in some cases worse than the disease. We gather from the newspaper reports of Dr. Kendall's speech that he is of the opinion that the Government should decide which of two warring labour unions should be favoured with recognition, and that the Government should be empowered to enforce their choice upon the employers of labour. Surely it would be a very disingenuous Government that would impose upon itself so obviously thank-

mend itself to such acknowledged "sidesteppers" as the politicians of Nova Scotia.

The word "recognition" seems to have achieved a great vogue of late in Nova Scotia. It has remained, however, for Mr. Paul, M. P. for Cumberland, to prepare a bill providing for compulsory recognition of labour unions by employers of labour on penalty of fines of from $100 to $200 per day, the fines to be collected by the union asking recognition. This is rather an ingenious way of raising strike funds. The bill is a very crude attempt to force the Nova Scotia Government to forcibly intervene in the present U. M. W. strikes at Glace Bay and Springhill, but nevertheless it is but a sorry compliment to the N. S. Legislature to present to them a bill so manifestly unconstitutional and at variance with common law. Mr. Paul's bill, if passed would not only legalize the "closed shop," but would force the acceptance of this condition upon the employers of labour. The position is unthinkable and absurd, but it shows how much of a shibboleth "recognition" has become in Nova Scotia, when it is possible for so ridiculous a proposal to be gravely submitted to Parliament. The bill is stated to be introduced at the request of the "Halifax Trades and Labour Council, the U. M. W., and organized labour generally." That is to say, the bill is the offspring of the U. M. W. alone, and the baby is very like its father.

QUEBEC.

Thetford.—Mining operations have been carried on extensively during the past winter and general business conditions have shown a marked improvement over preceding years. New mills are being erected on several properties that were exploited last season, and nearly all the old companies are increasing their plants very considerably. New mills that will be ready for early production are the Black Lake Consolidated, Black Lake; Jacob's Asbestos, Thetford Mines; Berlin Asbestos and B. & A. Asbestos, Robertsonville. The milling plants that are being largely increased are the several plants of the Amalgamated Asbestos Corporation at Thetford Mines and Black Lake, the Bell Asbestos, Thetford Mines, and the Robertson Asbestos at Thetford North. Although there is promise of a rapidly increasing production, shipments are improving steadily and large sales are being put through at high prices.

Interest is again being directed towards the development which is taking place in the placer deposits of the Chaudiere Valley. An engineer with large experience in the California placers has been engaged to supervise the operations and the installation of modern hydraulicking machinery. The syndicate handling the enterprise is composed of strong business men and the intention is to carry on the work on a large scale. Mr. J. R. Duckith exhibits magnificent samples of alluvial gold recovered from the test work done last fall and is sanguine in the belief that large profits will be realized from the operations in the near future.

The International Asbestos Association was recently formed in New York for the purpose of extending the knowledge and use of asbestos. The Amalgamated Asbestos and many of the private companies are associated with the movement, which promises to be an important factor in the growth of the industry.

A movement is on foot to organize a branch of the Canadian Mining Institute at Sherbrooke, having for its purpose the healthy growth and development of the existing mining industries and the further expansion of the natural resources of the province. The comments of the local press and public expression generally heartily endorse the formation of the local branch.

ONTARIO.

Kenora.—At a recent meeting of the Prospectors' and Mine Owners' Association of the Kenora Mining Division, it was decided, in view of the present movement in mining circles in the district and the present difficulty of giving inquirers some correct idea as to the rock formation and type of ore to be found in this district that the members of the Executive Committee should as far as lies in their power, make a collection of average samples of ores of this district and that such a collection should be on view in some public building in the town so that any bona fide prospector could obtain from it information that might be of inestimable service to him in deciding his course of action. A discussion then took place upon the possibility of moving the Government to act in a similar manner to the Governments of the Australian States. It is in these Australian States the habit of the Government to install small stamp mills at central points so that the prospector can obtain from the official in charge of such plant a certificate as to the value of his ore. The cost of fire outlay of such a plant is paid by the Government, the plant is then made to be self-supporting by making a charge for putting through sample shipments practically at cost. The first sample sent from any mineral claim is put through absolutely at cost, while any further samples from the same claim are put through at a slight advance over the cost so as to insure the Government plant being self-supporting. In Australia many poor prospectors have been enabled to sink a sufficient depth thoroughly to show up their properties by having their output milled in this manner, since the gold extracted by the Government mill is the property of the prospector putting through the ore, once the charges for milling and treating have been deducted. These plants are often in charge of only one man since the prospector for his own sake as well as the saving in cost usually supplies the man to feed the battery. When the gold has been recovered from the ore the Government official gives the prospector a certificate showing the value of the ore and deducts from the gold recovered a sufficient amount to pay the Government charges for the treatment, while the balance is handed back to the prospector. In many cases where a prospector has been too poor himself to purchase and erect a battery the fact of being able to procure the services of such a mill established by the Government has been a means of permitting him not only to know at once the value of his prospect, but also to do such work as to enable the capitalist to see what he is buying, and consequently lessen the possibility of fraudulent practices. In very few cases it has been known that the Government has been left with such a plant upon its hands when the day for its use has passed in as much as almost in every case where one of these plants has been erected some one or other of the claims at work in the vicinity has found it either expedient or necessary to purchase this plant for its own use. The amount of good which has been done by the Australian Government is incalculable, nor is there any reason why our Canadian Government should be backward in opening up the mineral wealth of the country.

It seems as if the West Hawk Lake District is at last getting that notice from capitalists that it has so long deserved but been without. A Winnipeg syndicate has, we have been informed on good authority, taken an option on some prospects in that vicinity for $50,000. This news, together with the now almost certain opening of the Mikado gold mine this spring, will mean such a revival of mining industry in this district as almost to amount to a rush.

Cobalt.—The condition of the lower level of the Crown Reserve, since it was known to have passed into the Keewatin formation, has been the subject of much speculation, and in view of this, it is interestng to note what is said regarding it by the manager. Mr. Cohen reports as follows:—

'However, it cannot be said that the vein at this level is as phenomenal as it was in the conglomerates above, although it is better than the average high-grade vein in the Cobalt distrct. The east winze at the present time is being sunk from the 200 to the 300-foot level, and shows the vein strong at the bottom

at a depth of 225 feet. In the development work on this vein about 8,000 ounces were obtained and stoping on this vein during the year produced 2,750,000 ounces.''

This mine produced 4,034,325 ounces of silver in 1909, having a gross value of $2,080,155, at a cost of 10.31 cents an ounce. This amounts to about one-sixth of the total production of silver from this camp for the year; but notwithstanding this the manager states that the mine is in a better physical condition and has more ore blocked out than it had a year ago. The average value of the ore was as follows:

	Ounces per ton.	Value per ton.
High-grade	4784.7	$2466.96
Low-grade, ...	184.4	75.81 ..

In addition to this, 76,152 ounces of bullion were produced that ran 869 thousands fine. The total cost of the silver produced is given at 10.31 cents per ounce, and the average price received for silver was 51.56 cents per ounce.

The Buffalo mine has declared the first dividend for this year, the same being 5 per cent. payable April first and a bonus of 3 per cent. payable May sixteenth. Up to date, the Buffalo has declared and paid dividends to the extent of 58 per cent, with additional bonuses of 15 per cent., making 73 per cent, in all. The President in speaking of the property, stated that although they had been greatly handicapped for lack of power, they had last year put in sight 3,000,000 ounces for the 1,000,000 ounces produced. The additional territory opened up to the west has added largely to the ore reserves.

The report of gold discoveries to the west of Matachewan is still arousing considerable interest among the prospectors in the vicinity of Elk Lake. The discoveries were made in quartz veins, in a country rock of schist, to the south west of the Township of Holmes. This formation is practically the same as that found in Porcupine. Some of the quartz veins or dykes are very wide. The territory is stated to be of large extent, and a number of parties have been sent in, within the last couple of weeks. These discoveries, coupled with the recent good finds made in several of the Elk Lake properties, have given a considerable impetus to operations in that district. The town of Elk Lake has unfortunately suffered another serious fire, which is stated to have done about $100,000 damage.

The City of Cobalt has again shipped high-grade ore, sending out 21 tons. All the low-grade is in the future to be treated in the Northern Customs Concentrator. A tramway has been built from the mine to the mill, a distance of 800 feet, which will greatly facilitate handling the material.

The Ophir Cobalt has cut what is believed to be the main vein, at the 200-foot level. On the upper levels this vein carried native silver, and where level this vein carried native silver, and where cut at 200 feet, the values are believed to be high.

An option has been given on the McAlpine property at Shanty Lake in the Gowganda district to New Liskeard men, most of whom are interested in the Hudson Bay Mine in Cobalt. Up to date, but little work has been done on the property although some good veins showing smaltite and native silver have been found. Should the option be taken up, the necessary machinery to open up the property will be sent in at once.

A new company, known as the London and Gowganda Exploration Co., with headquarters in London, England, has been formed for the purpose of developing properties in various parts of the country. In all, twenty-one claims have been acquired, and a gang of men will be sent in immediately to start work on the Gowganda properties.

About the first of April sinking will be started in the No. 2 shaft of the Provincial Mine. It will be put down to open up the vein located with the diamond drill before the present owners took charge. The shaft is now about 60 feet deep. The property is being systematically developed and has a good chance of making ore. To the east of the main shaft a long cross-cut is being run to explore the ground underneath the swamp. The two shafts are also to be connected up on the 125-foot level. During the coming summer the surface will be thoroughly trenched.

The main shaft on the Badger property is to be sunk an additional 200 feet from the present 200-foot level. This shaft was sunk on a vein that can be traced on the surface for about 1,700 feet. The silver contents of this vein are, however, low. There is another shaft down 200 feet on a vein from which about fifteen tons of high-grade ore has been produced, but the ore is pockety and not consistent. The property consists of about 82 acres on which a number of promising surface veins have been found.

The management of the Victoria Mine have decided to do a considerable amount of diamond drilling as underground work has been stopped until such time as the power companies are ready to turn on the air. The drill will be operated from the bottom of No. 1 and No. 2 shafts, and will test the veins that have been discovered on the surface.

At the Hargraves property there is at the present time nearly a carload of high-grade ore ready for shipment, besides a couple of cars of low-grade ore. Nearly all this ore came from the 375-foot level of the No. 3 shaft, from the extension of the Jacobs vein. Some time ago high-grade ore was found in the No. 1 shaft and considerable work has been done on the vein, which is showing up well. On the 175-foot level of the No. 3 shaft, a cross-cut is being run to cut the vein.

The recent discovery of high-grade ore on the 120-foot level of the Moosehorn Mine in the Elk Lake district has decided the management to install additional machinery. The equipment will consist of a six-drill compressor and two 75-horsepower boilers. When the plant is installed, development work can proceed much more rapidly. The main drift is only about 150 feet from the Pardon vein which shows high-grade ore on the surface. The Elk Lake district has been considerably excited lately over the discovery of free gold in the township of Bryce, near the trail between Elk Lake and Charlton. The finds were made within a short distance of the road. The country rock is schist and the gold is found in quartz veins. The formation is said to be very similar to that of Porcupine.

Last summer on the Rochester property, a vein was discovered on the surface that gave high assays in silver. In underground development from No. 2 shaft a vein that was believed to be the one on the surface, was cut, and a considerable amount of work was done on it, without any results. A short time ago a cross-cut was started to the north, which cut the original vein at a point about thirty feet from the other. Where opened up by the cross-cut it shows from four to five inches of ore that carries a good deal of native silver. In the No. 1 shaft a drift is being driven on a large calcite vein, which so far has proved unproductive. This is the first time in the history of the company that pay ore has been found in the underground workings.

In recent developments at the Princess mine of the La Rose consolidation the best ore shoot that has yet been discovered on that property was opened up on the 135-foot level. This is known as the No. 4 vein, on which a stope is being carried up. The ore in the back of the stope has been steadily improving until now it will carry in the neighbourhood of 2,000 ounces of silver to the ton. Conditions in other parts of the mine have been improving steadily, and it is probable that before long the shipments from this property will be an important factor in the La Rose production.

Although development work on the Little Nipissing has been greatly retarded for lack of power a very creditable showing has been made in the last few months. Last January rich ore was struck on the 160 foot level, and since that time a drift has been run on the vein for over sixty feet and a winze has also been sunk on the vein to a depth of 60 feet. The face of the drift and the bottom of the winze are both in good ore. The winze will be sunk 75 feet, and from that point a cross-cut will

be run to open up a parallel vein that lies about 20 feet distant. When power is available the management will carry out an extensive scheme of development.

The mining companies in South Lorraine are again agitating for the construction of a summer road and they wish the Government to do it. That part of the road that is most badly needed is from the Government docks back to the mines. The companies have already spent many thousands of dollars in road building but feel that as they are the ones who are opening up the country they should not be expected to shoulder all the expense. That the road is badly needed there is no question, but it is doubtful if the Government will give much aid, as that is not their way in this north country.

The Haileybury Silver Company has paid another dividend of 50 per cent., payable on April 5th. This makes a total of 100 per cent. paid to date. The money was raised by the sale of the south half of their property to the Haileybury Frontier Company, on which some good finds have lately been made.

In connection with the high grading cases now before the courts, true bills have been returned against several of those implicated. The information in all the charges has been changed so that the defendants are now charged with having in their possession ore which was the legal property of the Crown. This is in conformity with the statute, which declares that any ore for which an owner cannot be found lays in the name of the King. By this means it is hoped to circumvent the old clause, which throws the proof of ownership on the complainant.

The Airgoid Cobalt, which is situated to the east of the Nova Scotia, has been purchased by Seattle capitalists for $200,000, and the first payment of $25,000 has already been made. This year one-half of the total amount, or an additional $75,000, is to be paid. This property, which is advantageously situated, has never been developed. A small plant was at one time installed and a shaft sunk for a short distance, but later the company got into financial difficulties and work was stopped. Work will be started this spring and it is understood that a plant is to be installed.

Good ore is now being produced from the 185-foot level of the Meyer shaft of the Nipissing. The vein left the shaft at 75 feet, and from the bottom of the working a cross-cut was run to cut it. The vein has now been drifted on for about 30 feet and in places shows about 12 inches of high grade ore.

The famous suit of the Florence Mining Company against the Cobalt Lake Company has finally been settled. Before the Privy Council in England the appeal of the Florence was dismissed and the Cobalt Lake has now a clear title, although the outcome was never in doubt. The Florence Mining Company maintained that they had been sold the mining rights under twenty acres of the south end of the lake before the Ontario Government put the whole lake up at auction. The case has been carried from court to court and finally dismissed before the Privy Council.

Mr. H. L. Timmins, who owns the Hollinger properties in Porcupine, has taken an option on another group of claims in the same immediate vicinity. The option was only given in consideration of a large cash payment being made. Free gold has been found in more than one vein on these properties and they will be developed as rapidly as possible. The plant for the Timmins is on its way and will soon be installed. A trial shipment of ore has also been made and a mill test will be made to find out the best means of treating it. The McArthur properties are now being developed and shafts are being sunk. One of these is down about 30 feet and there are high values in gold at the bottom. Three carloads of machinery and supplies have been sent up by men closely identified with the Buffalo Mine. These people own several claims and will develop them as quickly as possible. Several deals are under way for well-known properties in the district, among them the Higginson claims, which are being negotiated for by New York men.

BRITISH COLUMBIA.

Phoenix.—The Granby Consolidated, pursuing its expansive and far-sighted policy, has just made another important deal in Phoenix district, whereby it acquired the Summit group of twenty claims comprising nearly 1,000 acres. The claims were acquired of G. W. Rumberger and associates, and are known to contain large deposits of low grade copper-gold ore similar to that now being mined at the Granby property. A contract has been awarded to Boyles Bros. for extensive diamond drilling on the Summit claim of the group and work will be started at once.

It is now definitely announced that the Canadian Pacific Ry. Co. will extend its line from Midway to Penticton and across Hope Mountains to the coast. As the Great Northern has already awarded contracts for its line from Princeton to the coast, with possibly the exception of a piece over Hope Mountains, this puts the two companies vying with each other in a race for Vancouver. No doubt inside of two years the Boundary and Similkameen districts will have two competing outlets to coast points and the benefits of such facilities cannot be over-estimated. The extension of the C. P. R. will particularly benefit the Crow's Nest district, and East and West Kootenay, as well as the sections named above, and the mining industry will not be one of the least important recipients of the benefits that will accrue.

The Columbia Coal & Coke Co., owning an extensive area of ground said to contain a good quality of steam coal, is now opening up its property with a view to active mining operations. Mr. Geo. L. Fraser, erstwhile of the International Coal & Coke Co., Coleman, is at the property in charge of the work. The mine is situated on Granite Creek, not far from Princeton, and the extension of the Great Northern line will soon afford it transportation facilities.

The new Rand compound condensing compressor and other heavy machinery recently bought by the Daly Reduction Co. are now at the Nickle Plate Mine, Hedley, and the main efforts of the mine force are being put forth toward erecting the addition to the plant.

Rossland.—The Le Roi 2, Ltd., during the week ending March 5th, shipped 800 tons of ore and concentrate, which constituted a record shipment for the year to date. Of 58 tons of concentrate shipped to Trail smelter by this concern in January the returns were $26.12 per ton, and of 2,382 tons of ore the returns were $17.14.

Nothing of an unusual character has developed during the past ten days in the work at the Le Roi, Centre Star, I. X. L., or Mayflower, at all of which work is proceeding along regular lines.

Nelson.—The men who are interested in the future of the zinc industry of this district are much gratified to learn that the Dominion Government is considering the matter of appropriating $50,000, to be spent in experimental work, toward a solution of the zinc smelting question here. There is no doubt about this being a problem of paramount importance to the province of British Columbia and to the Dominion, in more ways than one, while the success of lead-zinc mining here in the immediate future hinges upon its solution. This sum, along with that already expended by the interests here and the Provincial Government, should place the matter on a satisfactory plane and result in some definite action toward the smelting of zinc ore in this district.

The annual report of the Van-Roi Mining Co. shows that the company failed to earn a profit during the last year; in fact, have gone behind nearly $20,000. Owing to the lack of smelting facilities in British Columbia—or in Canada—for zinc ore, the plans of this company made at the beginning of the year were somewhat upset by the imposition of a higher tariff on zinc products entering the United States. This aided toward

the deficit. A profit on the year's operations, however, was not really striven for, as the main efforts of the operating force at the mine were concentrated upon the development, and particularly upon the driving of a straight 1,300-foot adit, 200 feet below previously existing openings, which has opened up the ore at depth and will be of economical importance in the future mining operations of the company. With the steady operations of the Van-Roi Mine and mill in the future it is estimated the property can be made to pay about $175,000 per annum on its capital stock.

The Yankee Girl mine, near Ymir, which has shipped nearly 1,500 tons of ore since the beginning of the year, has temporarily ceased shipments, owing to the bad conditions of the road from mine to railway siding.

The mines of the Crow's Nest Pass Coal Co. are probably shipping more coal than ever before. During the month of January the daily average was 4,100 tons per day, which was a record. The Hillcrest mines are busy just now on a contract for coal to the Great Northern Ry. Co. at Michel.

At Moyie, while no large finds of new ore are reported from the St. Eugene mine of the Consolidated Co., work is proceeding along regular lines and already this year the mill has made 3,195 tons of concentrate which was shipped to the company's smelter at Trail. During the past six weeks this company has also shipped 1,440 tons of lead ore to Trail smelter from the Sullivan mine.

At the Aurora mine it is said there is a tonnage blocked out of 35,000 tons and that shipments will shortly be begun to the smelter. The Society Girl mine, not far from the St. Eugene, is looking quite promising and ore shipments are to be started at no late date. The ore in the three-foot lead recently opened up carries 60 per cent. lead and approximately 30 ozs. silver per ton.

Vancouver.—While mining on the coast has been advancing gradually during the past several years the stimulus that has been and will be given to the situation this season will tend to a banner year. It is now seen that a lot of development work will be done on the copper deposits of Morseby Island; diamond drilling on the Ikeda property; work on the Sullivan group, the Swede group, in which that ubiquitous capitalist, J. P. Morgan, has bought an interest; drilling for coal on Graham Island, the development of the Portland Canal, Telkwa, Babine, Texada and Valdez Islands, and the probable working of the iron deposits on Vancouver Island. The plant at the Red Cliff Mine, Portland Canal, is rapidly being erected. An air compressor and electric lighting apparatus are being put in at the Perreault, in the same district.

On the Silver Cup group, near Hazelton, the work carried on during the winter has resulted in the opening up of ore valued at several hundred thousand dollars, and the property bears all the appearance of becoming a mine. Work on the Dibble group, in which Jas. Cronin is interested, has also been successful in opening up the ore shoot in the tunnel, and it begins to look as if this property would turn out a second St. Eugene or better.

At the Marble Bay mine, Texada Island, on the 1,000-ft. level, the company is working a 250-ft. shoot of bornite twenty feet wide, that carries approximately 9 per cent. copper, $7 gold and 25 ozs. silver. The Britannia Mining and Smelting Co. is going to have a good year. The Tyee Co. has added another and larger smelter to its plant and will no doubt enjoy a profitable and busy season. In fact, the outlook for coast mining is brighter than it ever was.

It is somewhat disappointing to British Columbians to learn that the Dominion Government does not intend to extend the bounty on iron and steel, for so far this province has had little or no benefit of this bounty, and at this time when several companies are about to open up our iron deposits it would undoubtedly prove of benefit.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax, March 9.—It is reported that the Dominion Iron and Steel Company intend to commence work sinking two stopes on the areas of the Cumberland Railway and Coal Company, often referred to as the Cowan and Drummond areas.

The Steel people took an option on these properties during their recent law-suit with the Dominion Coal Company, with the ultimate object of securing their own coal supply should the contract between the two companies be broken. Since that time, it is said that the Steel Company have completed the purchase of the areas from the Cumberland people. Stopes are to be located from the town of Port Morien. It is estimated that there are thirteen square miles of good, clean coal in areas which have been secured by the Steel Company, containing 150,000,000 tons of coal.

Stellarton, N.S., March 16.—The fire in the Albion slopes is now completely under control. Thirteen fire fighters with fire extinguishing apparatus arrived early on Wednesday morning from Cape Breton by special train, and they have succeeded in controlling the flames in the colliery. While these men have been working others have been busy building a substantial wall between the burning portion and other parts of the mine, and to-night it is thought that the loss will not be a very great one, although perhaps it will take a day or two more of steady work before the fire is completely extinguished.

Mr. John Johnson, assistant manager of the Nova Scotia Steel and Coal Company's mines at Sydney Mines, who has been here assisting at the fire, leaves on Thursday, but the fire fighters and the Draeger fire fighting equipment will probably be kept over for a few days. The mine workmen of this slope and the other collieries of the company have valiantly assisted in checking the progress of the flames, all working diligently towards this end, and some have been assisting with the fire fighters' equipment.

Sydney, N.S., March 18.—Judge Lawrence this morning granted an injunction restraining Harry Bousfield, D. McDougald, and other officers of district No. 26 United Mine Workers, and the officers and members of Mullins, Victory, Patterson, Bridgeport, Power, Caledonia, and McPherson locals from besetting and watching places where the Dominion Coal Co. carries on its business, or from interfering with its workmen.

Halifax, March 18.—The Government pronounced itself today as opposed to the appointment of a commission to enquire into the advisability of passing a law compelling recognition of labour unions or of investigating the price of coal in this Province. The vote showed three Government members—Kendall, Gillis and Paul—besides the Opposition, in favour of the resolution for the commission.

Premier Murray, in conducting the debate, said that New Zealand was the only part of the British Empire which made recognition of labour unions compulsory; that the United Mine Workers had not been recognized in any State of the Union and that it would be more becoming in them to obtain such recognition at home before coming to this Legislature asking for it. He was opposed, he said, to any enquiry into the price of coal, which he thought would be as unwise as an enquiry in the West into the price of wheat, or in Nova Scotia as to the price of fish. No one thought of asking for such enquiries; why,

then, should an enquiry be demanded regarding the price of coal? Under the amendment that carried, the matter was referred to the Government. An amendment moved by the leader of the Opposition, that the Government at once pass a compulsory recognition law, was voted down. Mr. Paul, a Government supporter, voting with the Opposition.

Amherst.—The Maritime Coal, Railway and Power Company is making rapid development. The output from their collieries recently exceeded 1,000 tons in one shift. This is about three times the output of this company a year ago.

The coal from the new slope at Joggins seems to be particularly popular. The sales in Amherst during January and February of this year were about four times greater than in these months of last year.

The electrical power department of the company is also advancing. For the installation of the new power unit which the company is adding at Chignecto, a new set of four 150 h.p. boilers have been lately placed, a new 750 h.p. generator, manufactured by Canadian General Electric Company, is now ready for wiring, and the Robb Engineering Company to-day shipped a 750 h.p. engine which is to be coupled to the above generator.

The company expects to add the additional power about the first of April. In the meantime the electric load is rapidly increasing. Among the large concerns which have lately taken power from the colliery are the McLean Milling Company and the Hewson Woollen Mills.

ONTARIO.

Toronto.—At Osgoode Hall, Toronto, judgment was given by Chief Justice Falconbridge last week in the case of John W. Casler against the Grace Mining Co., Ltd., and Messrs. G. J. Blake, Adam Witzel, Wm. J. Casler, and John F. Vogt for $12,000 and interest, secured by mortgage upon the company's mining claims in the Eagle Lake mining district.

The personal defendants disputed the mortgage and counterclaimed for $100,000 damages loss through the excessive price paid for the claims, $25,000 for sums wrongfully taken, $25,000 for carelessness in managing the property, $4,500 for amounts wrongfully paid directors, $10,000 for 20,000 shares wrongfully converted, besides $450 on subscriptions of stock.

The plaintiff was given judgment for the amount of his claim, but the defendants were held to have established their defence as bearing on their counterclaim and a reference was directed to the Master-in-Ordinary to ascertain the extent of the plaintiff's liability to them for large sums wrongfully converted while acting as their manager.

The plaintiff, his Lordship remarked, was an extremely plausible, presentable and intelligent witness, but (his only corroborators being his brother and his brother-in-law, and those only on minor points) he is contradicted by too many witnesses, too many circumstances, and too many writings. The plaintiff, while acting as manager of the company, and in the employ of the company, obtained large sums for the purpose of being applied in operation upon the company's property and he wrongfully and improperly converted to his own use large amounts of the money so entrusted to him.

Dealing with the mortgage, the judgment points out that by agreement of April 25, 1908, the time for repayment had been extended for three years from Feb. 25, 1908, four years after its execution. The plaintiff had been president of the company and resigned after a stormy meeting in 1907. After that, the company had practically ratified the mortgage and plaintiff was therefore entitled to judgment for the $12,000 and interest.

Cobalt, Ont., March 19.—Silver Bar lost its plant and blacksmith shop by fire yesterday afternoon. Superintendent Brown, who keeps steam up and water pumped out, now that no development is in progress, had just left the plant when the flames broke out, the fire being over within half an hour.

Elk Lake, Ont., March 15.—Disastrous fire at Elk Lake this morning destroyed the Woods hardware store, Chamandy Bros.' general store. King Edward Hotel, Smythe Hotel, and the Strong drug store. The total loss is about $155,000; insurance $80,000. Cause unknown.

Sudbury.—The Cheeney mine, north of Thessalon, is being pumped out, and it is probable that mining operations will be shortly resumed. The ore is very high grade, and the vein of good width and continuous for considerable length. The distance from railway is a drawback.

Fort William.—It is announced that the controlling interest in the Northern Pyrites Co., operating the well-known pyrites mine near Lake Superior Junction, has passed to the General Chemical Company of Chicago and Detroit, the company that had contracted for a large quantity of the output and took several cargoes of it last fall. This has somewhat changed the general policy of the shipment of ore and it is understood that the Grand Trunk Pacific Railway has arranged to take care of the product this year, and in the meantime the engineers of the General Chemical Co. will look over the ground at Fort William with a view to building a permanent dock.

BRITISH COLUMBIA.

Fernie.—Several important cases came before Stipendiary Magistrate J.S.A. Alexander in connection with breaches of the Coal Mines Regulation Act. The regulations strictly forbid any one working in them with matches, pipes, or tobacco, but, notwithstanding this fact the law has often been broken in this respect and the lives of many endangered by the practice. To-day six delinquents appeared before the court for having disobeyed this law with the following results:

Edward Ellis, charged with taking matches into the mine, found guilty and fined $10 or 21 days in jail.

N. Dosepan, $10 or 21 days in jail.

Luigi Ventura, $10 or 21 days in jail.

A. C. Stephenson, $10 or 21 days in jail.

The magistrate in passing the sentence pointed out the seriousness of the offence, explaining that this sort of carelessness placed in jeopardy the lives of those working in the mines and intimated his intention in future cases of this nature to send those charged and proven guilty to jail without the option of a fine.

Phoenix.—The Granby Consolidated Mining, Smelting and Power Company has secured a working bond on the Summit group and a number of adjoining claims, covering about 1,000 acres. It is one of the most important mining deals in the history of Phoenix camp.

The acreage of the bonded claims is about equal to the acreage of the Granby's present holdings in Phoenix camp. Very little development has been done on the Summit claims, but from indications it is expected that exploratory work will reveal large bodies of ore similar to those of the Granby mines. The Granby company will spend a large sum of money prospecting the properties under option with the diamond drill. The contract has already been let to Boyle Bros., of Spokane, and drilling will commence immediately.

YUKON.

Dawson, Yukon Territory, February 28th.—The Klondike has been roused to a storm of protest over interviews given the press of Canada and the United States recently by Albert J. Beaudette, formerly in the Mining Department of the Government of the Yukon, in which he is quoted as saying that prospecting is a thing of the past in the Yukon, and that the prospector is a rare bird in the Yukon, and that the Yukon Gold Company is the only outfit washing gold. The citizens have voluntarily subscribed to a fund to contradict this assertion as widely as possible.

Acting Governor Arthur Wilson, on receiving copies of interviews, immediately volunteered the following statement:—

"There is more systematic prospecting being done in this territory now than at any time since the advent of the white man. The faith of our people in the permanency of this country as a great mining district is more firm to-day than at any time since Robert Henderson made his discovery. More money is being spent by our citizens generally now in legitimate and systematic prospecting than in any other period of our history."

Mr. Wilson also names many other large dredging concerns besides the Yukon Gold now operating in the Yukon and washing and marketing gold.

The Klondike is just opening some of the richest quartz ever found in Canada, and it is believed by many here to be on the eve of a boom that will rival Tonopah, Cobalt, and Cripple Creek.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

The reports of some of the leading South Wales collieries for the past year show in nearly all cases a substantial reduction in profits as compared with the previous year or two. This is largely attributable to the unsatisfactory conditions prevailing in the second half of the year. Nearly all collieries suffered from stoppages of a more or less prolonged character; working costs have increased considerably, and there has been a heavy reduction in outputs consequent upon the lessened hours of labour. Prices ruling for coal on the open market have been satisfactory, but this has been more than counteracted by the low-priced contracts almost generally held by colliery owners. In fact, in the autumn contract season of 1908 orders were booked for delivery over the whole of 1909 at prices ranging from 3s. to 5s. per ton below those obtained for 1908 contracts. This fact in itself has been sufficient to interfere with the earning powers of all undertakings, and, in a large measure, has been responsible for the decline in profits. Had the conditions governing business in the second half of the year, however, been more favourable, there is no doubt that a much better showing would have been made by all companies. The prospects for the current year are much more favourable. The coal sold under contract for shipment in 1910 has been at advances of from 2s. 6d. to 4s. per ton, which alone should mean a marked increase in profits, whilst, in addition, there is every indication of comparatively high prices ruling on the open market for all classes of coal.

RUSSIA.

Oil producers in the Baku fields have hitherto been considerably hampered by the high rates of export to the port of Batoum, and it is satisfactory to learn that representations to the Russian Government have had the desired effect, and in future the rate will be reduced to 12 copecks per pood, instead of 19 copecks as hitherto.

During 1909 the total losses of oil through leakage while being exported from Baku by rail amounted to 117,320 poods of fuel oil, 92,500 poods of crude oil, 78,900 poods of kerosene, 168,200 poods of lubricating oil and 4,500 poods of benzine.

RHODESIA.

Bulawayo.—The development of the Surprise is proving highly satisfactory, the reef showing a width of 30 ins. and yielding over an ounce to the ton.

Further reports of a satisfactory nature are to hand from the Umkondo copper mine of the Consolidated (Africa) Copper Trust, the development data being consistently good.

News is just to hand of an important discovery on the Bunthorne (Bulawayo) property. It is stated to consist of a lode of auriferous schist 6 ft. wide, carrying visible gold.

The Aladdin block of claims has just been acquired by the Rhodesia Exploration Company. The rock at 100 ft. is stated to be giving 5 ozs. to the ton. The Arcturus, the Slate and the Grand Blocks belonging to the Rhodesia Exploration Company are looking very promising. Energetic development is being carried out on this line for a distance of nearly six miles.

The new mill of the Bucks Reef Company will start crushing in April. The development work continues to be quite satisfactory.

SOUTH AFRICA

Johannesburg.—There is promise of tremendous activity in the near future in that cluster of three Far East farms Modderfontein, Benoni and Brakpan. The whole of the Modderfontein of which only the new Modderfontein portion is at present producing gold, will then be either developing or producing. Modderfontein is a triangle with its base or northern side corresponding with the line of outcrop on the new Modderfontein and Modder B properties. To the dip of Modderfontein are the 326 claims of the Modder deep levels and the triangular block marked Kitzinger of 51 claims. Below this, in the apex of the triangle, are the two areas of some 1,250 claims each leased by the Government to Messrs. Barnato Brothers in terms of the State Mines scheme. Areas aggregating over 5,500 claims will thus be either developing or producing in quite a short space of time.

Johannesburg.—The repatriation of the Chinese has been completed; the last batch of labourers have left for home.

AUSTRALIA.

Queensland Mining in 1909.—Although the gold yield of Queensland, like that of all the other Australian States, showed a shrinkage during the past year—the return being 450,937 ozs., against 461,359 ozs. in 1908—the outlook is considered distinctly brighter for 1910. On the Charters Towers field important developments are reported to be taking place. In this district the total output for the past year increased, the value of the yield being £756,977, as against £722,557 in 1908. Official statistics show that the dividends for the twelve months amounted to £156,819, as compared with £100,980 in 1908, and the calls to £57,475, as against £60,522. At the close of the year came the long-looked-for news of a find in the new Brilliant Freeholds, and if this development opens up in a satisfactory manner it should much improve the prospect of the mines to the eastward, particularly Brilliant, Brilliant Block, Victory, Clark's Brilliant, Day Dawn Fine, Day Dawn and Brilliant St. George. At the Mount Morgan Company's mine at Rockhampton, the difficulties which for a time checked production have been surmounted, and the normal output has again been reached. The change in the system of mining has now been completely carried out, with the result that there is a larger output of average grade ore. In the annual report submitted to the directors by the general manager it was stated that as a result of exploration work carried on in the last half-year the reserves of the auriferous ore in the mine showed a very substantial increase, amounting to 530,000 tons blocked out. The completion of the Mount Chalmers, the Boyne Valley, the Mount Elliot and the Etheridge railways will undoubtedly be attended by increased activity in the various districts served by these lines.

UNITED STATES

Richmond, Va.—By dismissing the appeal of the United Mineworkers of America, the U. S. Circuit Court of Appeals has made permanent a temporary injunction of sweeping

character. The case is that of president of the Mineworkers, as an individual, and as vice-president of the Union against the Hitchman Coal and Coke Company of West Virginia.

It is an appeal from the decision of the Circuit Court for the northern district of West Virginia.

The injunction restrains the Union from interfering with employees of the company for the purpose of unionizing the mine; from interfering and conspiring to interfere with employees of plaintiff; so as knowingly to bring about in any manner the breaking by the plaintiffs' employees of contracts for service, existing at the time or thereafter entered into; from trespassing on the company's property; from compelling by threats of violence any employee to leave; from establishing pickets around the property of the company for the purpose of using violence or threatening or persuasive language to induce the company's employees to leave.

Wilkesbarre, Pa., March 12.—Seven miners lost their lives in the No. 5 shaft of the Lehigh and Wilkesbarre Coal Company near here to-night in an explosion of gas. There were eight men in the party, but one of them was away from the scene of the explosion getting some tools and was not injured.

The officials have the theory as to the cause of the explosion. General Manager Huber said it did not cause much damage.

De Lamar, Nev.—Mining engineers representing both the Newhouse and the Guggenheim interests have been in De Lamar for some time examining the old De Lamar mine and properties adjacent to it, especially the Magnolia.

The Magnolia, to the depth of 300 feet, carried large values in free-milling gold. Below that depth silver and copper values came in to such an extent that the company's mill was unable to handle it. A reduction plant had been planned by the company's engineers when came the order to close down.

This property, near the surface, produced several fortunes from its gold ores, the product being of such grade as to make its marketing profitable even after it has been hauled across the desert to Milford, Utah, and from there placed on the local market via the railroad.

The ground was eventually taken over by the Delamar company, the management of which started the sinking of a deep shaft. As depth was attained, however, the gold values apparently gave out and were replaced by silver and copper ores, for the treatment of which there was no nearby plant.

Goldfield, Nev.—A petition has been filed in the supreme court at Carson in the case of the state of Neveda on relation of O. C. Moore against the Manhattan Verde Mining Company and R. P. Dunlap, its president, for a writ of mandamus compelling the company to stamp certain certificates of its stock treasury or promotion as required by the act passed by the last legislature, commonly known as the wildcat law.

The act went into effect on March 5, 1909.

Juneau, Alaska, March 3.—Twenty three miners were killed last night by an explosion of a powder mazagine in the 1100-foot level of the Mexican mine, one of the group of Treadwell gold properties on Douglas Island. Eight men were seriously injured and four of these may die.

The last shots had been fired by the night shift 20 minutes before the men were assembled at the elevator to go on top. The mazagine, which contained 275 pounds of powder, was 30 feet from the place where the men were standing, but every man was killed or injured.

Most of the miners were foreigners. The man in charge of the magazine had locked the door where the explosives were stored, and was standing with the other men. He was also killed.

Company Notes

YUKON GOLD.

The Annual Report of the Yukon Gold Company, in which a large number af Canadians are interested, for the year ended December 31, 1909, is issued. President Guggenheim says in part:

"It is to be noted that the company finds itself practically one season behind in its hydraulic operations, which will necessitate some modification of the estimates, heretofore made of probable earnings for 1910. This, however, does not affect the estimates which are of paramount importance, such as the value per cubic yard of the property owned by the company, operating costs, etc., which have been verified by actual results.

"During the year the company was placed upon a dividend-paying basis at the rate of eight per cent. per annum, and this rate should be maintained until the earnings justify an increase.

"Mr. Yeatman, consulting engineer of the Guggenheim Co., made a very favourable report during the year, summarized as follows: 'To sum up, I may say after carefully looking into conditions, that your undertaking in the Yukon Territory is a wonderful piece of work; from an engineering point of view, one of great promise, whose success is now being satisfactorily proved.'"

The balance sheet as of Dec. 31, 1909, follows:

ASSETS.

Property and investment	$11,857,000
Equipment	6,073,045
Deferred charges	491,244
Supplies and material	434,579
Accounts collectable	300,931
Cash	9,863
Total	$19,166,662

LIABILITIES.

Capital stock	$17,500,000
Guggenheim Exploration Co.	1,050,266
Accounts payable	120,849
Depreciation	142,731
Surplus	352,816
Total	$19,166,662

BRITISH COLUMBIA COPPER COMPANY.

The report of Mr. J. E. McAllister, general manager of the company, is as follows:

"Production was interrupted for a period of three months from May 4th to August 8th; a strike of the coal miners of the Crow's Nest Pass District (from which our fuel supply is obtained) causing a cessation of coke shipments, and the cost of fuel from more distant points being prohibitive when taken with the price of copper.

"The material handled at mines and reduction works during nine months' operation was:

	Tons. Shipped	Tons. Shipped
Mother Lode Mine	338,639	337,089
Oro Denoro Mine	11,771	13,384
Napoleon Mine	16,614	11,950
	367,024	362,423
Custom Ore		6,964
Converter Slag		3,939
Total		373,336

"**Mother Lode Mine.**—Operations are under the direction of Mr. Paul S. Couldrey, superintendent, and the greater portion of ore shipped has been from above the 200 foot level. During the year the open cut workings have been extended in two directions, and stoping in the underground workings has further increased the ore reserves beyond the estimates, this being particularly the case on the 400-foot level, where the largest amount of development work has been performed. This property has furnished the bulk of the supply, and the workings, as well as the surface plant, have been maintained in excellent condition. Additional receiver capacity has been added for the purpose of equalizing the pressure of the compressed air supply with very satisfactory results. The diamond drill exploration has consisted of 3,680 feet.

"**Oro Denoro Mine.**—The ore from this mine being more basic than that of the Mother Lode, it has only been drawn upon as required. Mr. P. W. Lover is in charge at the property, and during the year 1,181 feet of diamond drilling has been done.

"**Napoleon Mine.**—This property has been worked intermittently, its production being drawn upon as required to make up for the deficiency of sulphides in the other ores. Of the 16,614 tons shipped from the mine, 2,120 tons were sold, the balance coming to this company's own reduction works.

"**Jack Pot Group.**—Comprises the Jack Pot, Athelston Fraction, Molly Pritchard, Coronet Fraction, Iron Clad Fraction, Florence and Prince, located in Wellington Camp, operations being in charge of Mr. H. Johns. The claims were secured under a working bond in September of 1908, since which time prospecting and development have been carried on continuously. In all 2,532 feet of drifts, tunnels, and raises have been driven and a large tonnage of ore opened up, the grade of which will be somewhat better than the average of the other properties, the values being chiefly gold.

"Developments having justified completing the purchase, surface buildings are in course of construction, and the Canadian Pacific Railway is now building a line to the property which will be completed early in March, 1910, after which shipments will be regularly maintained. The company undoubtedly has here a valuable asset, all of which has been established during the past year.

"**Lone Star Mine.**—Work has been suspended throughout the year awaiting transportation facilities, although a railway line has been surveyed to the mine by the Canadian Pacific Railway Company.

"Operations at the reduction works are under the superintendence of Mr. E. G. Warren, and various improvements have been added to the plant, chief among which is the additional storage bin capacity for 1,000 tons of coke. The three blast furnaces (48 in. x 240 in. at the tuyeres) were in operation for 623 furnace days, the failure of the coke supply previously mentioned causing a loss of approximately 290 furnace days.

"The average tonnage handled exclusive of coke during the period of operation was 599.2 tons per furnace each twenty-four hours, making a total of:

	Tons
B. C. Copper Co.'s Ores	362,423
Custom Ores	6,964
Converter Slag	3,949
	373,336

"Included in the item of converter slag is an amount of 1,588 tons of custom ore and clay used in converter linings. From the above material handled, blister copper to the amount of 6,366,318 lbs. has been recovered, containing:

"A comparison of figures with those of the year 1909 is as follows:

Fine Copper	lbs...	6,325,000
Gold	ozs...	18,244
Silver	ozs...	64,234

"Appended will be found Balance Sheet as at November 30th, 1909, and Profit and Loss Account as rendered by the auditors.

Yield of Copper per ton of B. C. Copper Co.'s Ores	17.7 lbs.	17.8 lbs.
Yield of Gold and Silver per ton, B. C. C. Co.'s ores	$1.06	$0.985
Average price realized for copper	13.03c	13.504c
Cost of Producing, Refining and Marketing per pound of Fine Copper, after crediting expenditure with Gold and Silver Values	9.829c	9.996c
Cost per ton of Ore handled including all charges from Ore in place to sale of the contained metals	$2.683	$2,632

"In general the standard of operations has been higher than the previous year, as the expense of closing and re-opening, including the period of three months' cessation on account of coke shortage, has all been borne by the balance of the year when operations were in progress. All expenditure at the mines and reduction works for additions, improvements and maintenance has been taken up in the operating cost for the year, and the various plants have been maintained in as high a state of efficiency as possible."

PACIFIC PASS COAL FIELDS CO.

A report was presented to the shareholders of the Pacific Pass Coal Fields, Ltd., at their first annual meeting held on March 1.

The directors stated that the company had had an engineering and prospecting party on the property all last summer, and that the coal had been tested in numerous places. It was proved beyond doubt that an immense quantity of coal existed in the property, running into the hundreds of millions of tons, and from Government analysis the quality was found to be equal to the best grades of the well known bituminous coals of Cape Breton and the United States.

The directors were also pleased to be able to report to the meeting that they had signed on behalf of the company a contract with the Grand Trunk Pacific Railway Company, by which the railway company undertakes to build a branch line from their main road through the Yellowhead Pass to the property of the Coal Company, the Grand Trunk Pacific Company guaranteeing to have the branch line completed by December 1st of this year.

Further development work will be done this summer and there seems to be no doubt that the mines will be shipping coal almost immediately after the branch railway is completed.

The following directors were elected for the year: E. B. Greenshields, Hon. Robt. Mackay, W. Molson MacPherson, J. Theo. Ross, H. A. Lovett, K.C., A. H. Cook, K.C., F. L. Wanklyn, J. W. McConnell, R. Brutinel, A. De Bernis.

At the subsequent meeting of the directors Mr. E. B. Greenshields was elected president of the company, Hon. Robert Mackay vice-president, and George C. Cousins secretary-treasurer. An executive committee was also appointed consisting of the president and Messrs. H. A. Lovett, K.C., and J. W. McConnell.

BUFFALO.

The Buffalo mine has declartd a quarterly dividend of 5 per cent. payable on April 1st and a 3 per cent. extra dividend on May 16. This is the same as the last dividend declared.

Including the dividend just declared the Buffalo mine has paid to the shareholders 73 per cent. of the total capitalization. Up to last year a rate of three per cent. quarterly was maintained and eleven dividends at this rate totaling $297.000 dollars was paid. In 1909 the dividend was raised to the present rate.

According to a statement recently made by the president of the company, three million ounces of silver were put in sight in addition to the million ounces mined during last year.

The Buffalo Mines Co. has declared the regular quarterly dividend of 5 per cent., payable April 1, and an extra quarterly dividend of 3 per cent., payable May 16.

Directors of Crown Reserve have declared the regular dividend of 6 per cent. and a bonus of 9 per cent. on their company's capital stock, making a total of 15 per cent., payable April 13, to shareholders of record April 1st. The books close from 1st to 15 th of April.

The International Nickel Company directors have declared the regular quarterly dividend of 1 per cent. on the common stock, and one half of one per cent. extra was declared.

The Canada Cement Company has been awarded an order by the Dominion Steel Company for 40,000 barrels of cement, delivery during 1910.

This order was procured in competition with the English cement companies, it is said.

The shipments of the Canada Cement Co. up to March 1st are 40 per cent. greater than they were for the corresponding period in 1909.

STATISTICS AND RETURNS

The official report of the Temiskaming and Northern Ontario Railway is a most satisfactory one. The freight earnings for 1909 amount to $944,000, as against $471,000 in the previous year, while the passenger receipts were $592,000, as compared with $366,000 in 1908. The total net earnings for the year, including ore royalties, were $739,451, as against $419,488 in 1908. The ore royalties were $113,301, as compared with $134,820 the previous year.

The output of gold at the Transvaal mines in February, as reported by the Johannesburg Chambers of Mines, was 575,622 ounces, fine, valued at $12,232,000. London estimates at the close of February had, as reported by cable, been 555,000 ounces. The month's total was, nevertheless, the smallest in a year.

The Consolidated Mining and Smelting Co. of Canada report ore receipts at Trail Smelter for the week ending March 5 and year to date (in tons), as follows:

Company's Mines—	Week.	Year.
Centre Star	4.168	33,639
St. Eugene, (con.)	602	3,311
Snowshoe	4,471	35,719
Richmond-Eureka	33	894
Sullivan	261	1,444
Other mines	1,721	17,715
Total	11,256	93,222

ROSSLAND ORE SHIPMENTS.

Following is the tonnage of ore crushed at and shipped from the mines of Rossland for the week ending March 5th, and for the year to date:—

Mine.—	Week.	Year.
Centre Star	3,580	36,533
Le Roi Two	455	4,467
Le Roi	105	1,548
I. X. L.	....	26
Velvet	....	220
Totals	4,140	42,794

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending Mar. 11, and those from Jan. 1, 1910, to date:—

	Mar. 11. Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo	.....	292,453
City of Cobalt	42,000	235,970
Cobalt Central	.....	165,286
Cobalt Lake	.....	132,000
Colonial	.....	63,660
Coniagas	.....	295,757
Crown Reserve	.....	951,350
Drummond	.....	664,200
Hudson Bay	.....	62,365
Kerr Lake	119,360	1,193,849
King Edward	.....	93,129
La Rose	375,615	2,427,516
McKinley-Dar.	166,000	437,860
Nipissing	311,892	2,260,946
O'Brien	.....	328,806
Peterson Lake	.....	170,450
Right of Way	67,000	320,436
Silver Cliff	.....	66,010
Temiskaming	.....	180,000
Trethewey	.....	127,000

Ore shipments for week ending March 11, were 1,081,868 pounds, or 540 tons.

Total shipments from Jan. 1 to March 11 were 10,469,052 pounds, or 5,234 tons.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending Mar. 18, and those from Jan. 1, 1910, to date:—

	Mar. 18. Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo	124,500	416,953
City of Cobalt	.....	235,970
Cobalt Central	....	165,286
Cobalt Lake	.....	132,000
Colonial	.....	63,660
Coniagas	.....	295,757
Crown Reserve	61,110	1,012,460
Drummond	.....	664,200
Hudson Bay	61,330	123,695
Kerr Lake	.....	1,193,849
King Edward	.....	93,129
La Rose	238,974	2,666,490
McKinley-Dar.	150,561	588,421
Nipissing	65,381	2,326,327
O'Brien	.....	328,806
Peterson Lake	.....	170,450
Right of Way	.....	320,436
Silver Cliff	.....	66,010
Temiskaming	.....	180,000
Trethewey	.....	127,000

Ore shipments for week ending March 18 were 701,856 pounds, or 350 tons.

Total shipments from Jan. 1 to Mar. 18, were 11,170,908 pounds, or 5585 tons.

The output of gold at the Transvaal mines in February, as reported by the Johannesburg Chambers of Mines, was 575,622 ounces, fine, valued at $12,232,000. London estimates at the close of February had, as reported by cable, been 565,000 ounces. The month's total was, nevertheless, the smallest in a year.

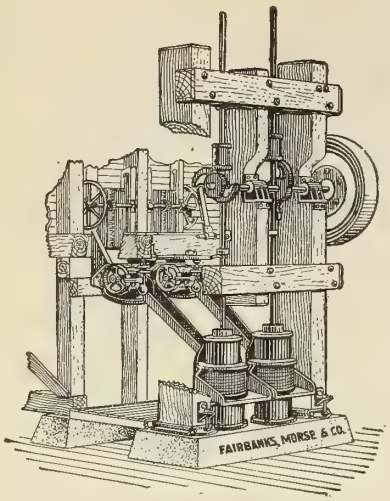
NOTICE

STUDENTS EMPLOYMENT REGISTER,

The CANADIAN MINING JOURNAL has opened an employment register for students taking mining or metallurgical courses at Canadian Universities or Technical Colleges. Mine operators who wish to employ students during the summer months are requested to communicate with the Business Manager.



Students are requested to send in their names, along with brief records of experience. These will be filed and no effort will be spared on our part to place applicants in immediate communication with possible employers.

NISSEN STAMPS

THE MODERN INDEPENDENT CIRCULAR MORTAR GRAVITY STAMP.

ADVANTAGES

MAXIMUM CRUSHING CAPACITY SECURED

BECAUSE—The feeding of ore into each individual mortar is under constant control.

Immediate free discharge of pulp as produced is secured.

Freedom from interruption of operation, is secured due to the independence of units, allowing any one or more units to be "hung up" without disturbing the operation of the rest.

QUALITY OF PULP—Owing to controlled feeding and screen discharge there are much less unmanagable slimes produced than with other mills.

POWER—Owing to the great crushing efficiency secured, the power to operate is about half that of other mills of the same capacity output.

WEARING QUALITIES—The shoes and dies wear evenly. The weight of the stamps can be maintained constant, counteracting wearing away of the metal.

The Canadian Fairbanks Co., Limited

Fairbanks Scales—Fairbanks-Morse Gas Engines

Montreal, Toronto, St. John, N.B. Winnipeg, Calgary, Vancouver.

Take Advantage of Several Specialists in One Organization.

¶ We analyse ores, minerals, metals and furnace products. Speed and accuracy are the features of our laboratories. We weigh, sample and assay lots for shippers. Let us represent you at Smelters and Refineries.

¶ Each department headed by a Specialist. We are fully organized to take entire charge of the technical work of mines or mining properties.

¶ Consult us about your mine equipment, your mill or your cyanide plant.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

GEOLOGICAL SURVEY

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, and with many local areas and special subjects.

MARITIME PROVINCES

The whole of Cape Breton, and a large portion of the coal and gold fields of Nova Scotia, have been reported upon, and mapped on a scale of 1 mile to 1 inch. The remaining portions of the Province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter Provinces, mapped on a scale of 4 miles to 1 inch.

QUEBEC

Quebec, south of the St. Lawrence, has been reported upon, and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the Province north of the St. Lawrence are also available.

ONTARIO

A large part of the Province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the Provinces of Manitoba, Saskatchewan, and Alberta

BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the Province, have been reported upon and mapped.

YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

THE NORTH WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost, and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.

THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

CANADA

1084. General Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet.
1025. Waverley Sheet.
1037. Windsor Sheet.

The above sheets belong to the regular series of Nova Scotia map sheets on a scale of 1 mile to 1 inch. The first includes Halifax City and Harbour, the second the Waverley Gold District, and the third Gypsum Quarries.

ONTARIO

1023. Geological Map showing position of Corundum-bearing rocks in Central Ontario.
1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

980. Portion of Algoma and Thunder Bay districts, Ontario, 1906. W. J. Wilson.
1081. Region lying north of Lake Superior between the Pic and Nepigon Rivers, Ontario, 1906. W. H. Collins.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shows the geology and location of veins.

1004. Geological Sheet, Rossland Mining Camp. Scale 1200 feet to 1 inch.
1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch.

YUKON

1041. Geological and Topographical Map of Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of same belt.

NOTE.—Maps recently published may be had on linen cloth, for use in the field, at 10c. per copy.

REPORTS

1072. Summary Report of the operations of the Geological Survey for year 1908.
1085. Descriptive Sketch of the Geology, and Economic Minerals of Canada. G. A. Young. Introduction, R. W. Brock.
1075. Gowganda Mining Division, 1908. W. H. Collins.
1035. Coal Fields of Manitoba, Saskatchewan, Alberta, and Eastern British Columbia, 1908. D. B. Dowling.
1050. Whitehorse Copper Belt, Yukon. R. G. McConnell.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

An Important Trio

Economics

Principles

Methods

Within a few months three highly important mining books have appeared, covering the practical, the fundamental and the economic phases. They are valuable books by thoroughly sound men of established reputations.

The Cost of Mining

By JAMES R. FINLAY

415 pages, 6x9, illustrated

$5.00 (21s.), net, postpaid

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover costs of mining **coal, iron, lead, zinc, copper, gold** and **silver.**

Contents: Value of Mining Property, Factors Governing Variations, Partial and Complete Costs. Statistics of Coal Production. Costs of Mining Coal. Cost of Mining Lake Superior Iron. Occurrence and Production of Copper. Lake Superior Amygdaloid Copper Mines. Conglomerate Copper Mines of Lake Superior. Copper Mines on Fissure Veins in Montana, Australia and Arizona. Various Copper Mines of Arizona and Mexico. Copper Mines in various other Districts. The Copper Mining Business in General. Lead. Silver-Lead Mining. The Cost of Silver-Lead Smelting. Zinc Mining. Occurrence and Production of Gold. Quartz-Pyrite Gold Mines. Cripple Creek. Kalgoorlie and Goldfield. Silver Mining at Cobalt and Guanajuato.

Principles of Mining

By H. C. HOOVER

200 pages, 6x9, illustrated

$2.50 (10/6), net, postpaid

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Part I deals fully with the determination of value, prospective and in sight—the sizing up of the mine—and in this Mr. Hoover's work has been extensive and highly successful.

Part II discusses the development of tunnels, shafts, crosscuts, etc., with chapters on mechanical equipment and efficiency.

Part III. Administration of mines with all the problems of labor efficiency, labor unions, wages, working costs, accounts, division of expenditure, etc.

The main chapter headings are: Valuation of Copper, Gold, Lead, Silver, Tin and Zinz Lode Mines. Mine Valuation. Development of Mines. Stoping. Methods of Supporting Excavation. Mechanical Equipment. Ratio of Output to the Mine. Administration. The Amount of Risk in Mining Investments.

Timbering and Mining

By W. H. STORMS

300 pages, 6x9, fully illustrated

$2.00 (8/6), net, postpaid

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Contents: Introduction. Timber Used in Mining. Preservation of Timbers. Drifting and Drift Sets. Driving Lagging in Drifting. Driving in Running Ground. Breast Boards. Structural Steel in Mine Workings. Timbering Drift Gravel Mines in California. Shafts. Location, Kind and Size of Shafts. Prospecting Shafts in Good Ground, and Those Requiring Close Timbering. Cribs and Single Compartment Shafts. Size and Division of Working Shafts. Drainage. Position of Temporary Hoisting Plant and Permanent Plant. Size of Shaft Compartments. The Collar. Hanging Belts. Cross Head in Sinking Shafts with a Bucket. Stull Methods in Many Small Mines of the Cobalt District, Ontario. Bucket Dumping at Vertical Shafts. Bucket Dumping at Inclined Shafts. Framing Shaft Timbers. Butt Corner and Dove-Tail Corner Methods. Framing for Vertical Shafts. Divider and Spliced Wall Plate. The Template. Placing Timbers of Shaft Sets in Position. Placing Timbers in Inclined Shafts. Lining the Sets. Difficulties in Sinking Through Running Ground. Sinking Through Running or Loose Ground. Combination Vertical and Inclined Shafts. Bearers in Shafts. Fenders for Protection of Shaft Timbers When Blasting. The Cable Mat. Extension Tracks for Sinking. Inverted Rails. Sinking Ladders.

We can supply any engineering book in print.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

"FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

General Passenger Department, Intercolonial Railway

MONCTON, N.B.

We illustrate the Hecla Mining Company's Hoisting Plant at Burke, Idaho, one of the largest of its kind and a good example of

The Westinghouse Equalizer Hoisting System

Some particulars of the installation follow:

The hoist motor is a Westinghouse 450 h. p., 600 Volt, 60 R.P.M. Direct-Current Motor, which obtains its power through a Westinghouse Fly-Wheel Motor—Generator Set, consisting of a 450 h.p., 2300 Volt. Type H. F. Induction Motor, a 30,000 lb. Fly Wheel and a 450 K. W., 600 Volt, Direct Current Generator. The normal duty of the hoist is 6,000 lbs unbalanced load; maximum speed 2,000 R.P.M. ultimate depth of shaft 2400 feet.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

THIS TAN KHAKI DUCK SHIRT

$1.00

A great dollar's worth for Miners, Prospectors, Surveyors.

The kind of shirt that will turn a shower—you've seen them on sale time and again at $2.00, as these details will show you;—

Made from extra strong duck, double stitched throughout, with strong gussets, heavy yoke on shoulders, large long bodies, full sleeves with plenty of elbow-room, brass dome fasteners throughout, instead of buttons. Two pockets, with flaps and dome fasteners.

We've counted on a tremendous demand for this shirt and the quantities bought bring our price down to One Dollar.

N. B.—When ordering, be sure to ask for our "Dollar Invincible" shirt, and send 19 cents extra to cover postage. All sizes and half sizes from 14 to 18.

FORSIGHT

is better than hindsight when applied to mine development, and less expensive.

This means testing your property with a Sullivan Diamond Core Drill, before you buy machinery or begin your shaft or tunnel.

A set of diamond drill cores will tell you where your values are, what they are and how you may reach them most quickly and economically.

Sullivan Diamond Drills are in stock for any capacity and any working conditions.

Amatite ROOFING

WILL END YOUR ROOFING TROUBLES

IF you will write to-day for a free sample of "Amatite" the end of your roofing troubles is in sight. After you have submitted it to every test that you can think of, you will be prepared to order it not only for your *new* buildings, but for your *old* roofs as well. You will find that it is cheaper to cover them with Amatite than to continue painting and repairing them.

We make a strong point of our "Free Sample" offer because the smallest sample of Amatite speaks for itself. It is more convincing than yards of talk.

There are all kinds of ready roofings on the market—so-called "rubber roofings," so-called "guarantee roofings," so-called "sand surface roofings."

The "rubber" roofings are no more made of rubber than a cow is made of saw-dust. The "guarantees" that are promiscuously handed out with many brands are hedged around with so many provisos that it will take three lawyers to dissect them and find out what they are all about. The "sand surface" has little or no protective value.

The point to remember is that all of these roofings have to be *painted* every year or two to keep them tight. In other words, it is the *paint* that protects and not the roofing.

You can lay Amatite on a roof and then forget all about your roofing troubles. *No painting, no coating, no worry.* The man who puts Amatitite on his buildings is insured against leaks and trouble for many years.

FREE SAMPLE

Send for sample and booklet to-day. The sample tells its own story: the booklet is written for practical men.

Address our nearest office.

The Davis Handbook

OF THE

Cobalt Silver District

By H. P DAVIS.

ILLUSTRATED WITH PHOTOGRAPHS

¶ The first section of this volume is an outline on the Geology, Mining Treatment and Marketing of the Ores of the Cobalt District, the object being to give all the data and general information necessary to guide investors, brokers and professional men generally.

¶ Included in this volume is a complete and accurate directory of all mining companies operating or organized to operate in the Cobalt Silver District of Ontario.

¶ Full information as to capitalization, directorates, locations and conditions of properties is given. Tabulated statements of production and dividends revised up to January, 1910, are included.

THE

MINING MANUAL

1910

BY WALTER R. SKINNER.

The Standard Reference Work on Mines.

Price 17/- net Post Free (Abroad).

1,600 pages. In demy 8vo, handsomely bound in RED cloth.

A record of information concerning

MINING COMPANIES

(Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, Exploration and Mining Investment Concerns, &c.)

Arranged in three sections—

Australasian, African, Miscellaneous,

Preceded by Tables of Crushings and followed by lists of Mining

DIRECTORS, SECRETARIES, MINING and CONSULTING ENGINEERS and MINE MANAGERS.

Their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected, and a

DICTIONARY OF MINING AND OTHER TERMS.

THE MINING MANUAL for 1910 contains particulars of over 3,600 Companies arranged in three sections, 430 Companies being AUSTRALASIAN (including Western Australia, Queensland, Broken Hill, Deep Leads, New Zealand and Tasmania); 1,030 AFRICAN (including Transvaal, Rhodesia ,West Africa, Cape Colony, Natal, Egypt); and 2,140 MISCELLANEOUS (including Siberia, Mexico, India, British Columbia, America, &c., and the Coal, Iron, Tin and other Mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; plant erected or in course of erection; present working results; ore reverses; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts. Highest and lowest prices of the shares for the last four years, also latest price. The three sections extend over 1,100 pages,

Crushing tables and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

The Lists of Directors (8,000), Secretaries (1,900, Mining and Consulting Engineers and Mine Managers (1,400) include their addresses and descriptions and names of the Companies with which they are connected.

A complete Alphabetical Index, containing the names of 5,300 Companies and including many useful items of reference, occupies 42 pages.

Full particulars of all Re-constructions, Re-organisations and Amalgamations during 1909 are given in a simple and concise form.

THE ONTARIO PUBLIC SCHOOL TEXT BOOKS.

A small storm is raging in Ontario educational circles. Our readers will remember that eight months ago we alluded editorially to the fact that "the new Ontario Readers, excellent though they be in many regards, still conform to the outworn and artificial standards of thirty years ago. While they are probably the best school books that we have yet seen, still they fall very far short of what they should and could be." In general our editorial dwelt upon the evident paucity of descriptive and informational matter pertaining to Canada. We emphasized particularly the absence of any allusion to the industrial life of this country, and pointed out that the books contained not one reading concerning such an important industry as mining.

These animadversions the compilers answered by claiming that the school books were intended to be "inspirational" and not "informational." In this argument we can see little sense. Children derive inspiration of the proper kind from information interestingly presented. Canadian children should know something about Canada, about our forests, mines, farms, and industries. And knowledge of these things need not be acquired through pages of statistics, nor through dry didactic dissertation. In the discovery and exploitation of our mining regions, for instance, there has been developed much true romance. What could be more "inspirational" than the story of Silver Islet, or of the early labours of Canadian geologists, or the thousand and one incidents of pioneer life connected with the history of mining all over Canada! Surely it is well for the Canadian child to learn something of what Canadian citizenship means. The one crying need that faces our nation to-day is the evolution of a new brand of Canadianism. It strikes us as being rather piffling to prescribe large doses of conventional and hackneyed literature to "inspire" the rising generation.

We notice that the teachers of Ontario have given expression to their disapproval of the new books. They, and other critics, have not been answered by the Department of Education. The sole (and quite inadequate) response has come in the shape of a characteristic explosion from the impetuous Sir James Whitney. In the absence, through illness, of the Hon. Dr. Pyne, Sir James occupied the position of Minister of Education. When asked for his opinion concerning the aspersions cast upon the new books, Sir James erected himself into a volcano. This, while interesting, is not instructive. Neither is it inspiring. Vesuvius and other established centres of volcanic activity can do the trick far better.

Meanwhile we shall reiterate our former opinion to the effect that there will always be something lacking in

school books that teach the child nothing about the country in which all of us live and move and have our being.

THE SPRINGHILL SITUATION.

If we remember correctly, the number of strikes that have occurred at the Springhill collieries of the Cumberland Coal and Railway Company approximate roughly twenty-three in the last score of years. During this period the collieries have been under the management of one person.

The present strike, declared some eight months ago, had for its ostensible cause the refusal on the part of the management to recognize the U. M. W. A. In this instance the management has our entire sympathy. We believe that official recognition of the U. M. W. A. would be inimical to the interests of mining in Nova Scotia. Nevertheless we cannot but be impressed by the fact that the miners of Springhill, good and responsible citizens, have readily accepted this as a bone of contention.

Strikes are costly luxuries. They are the most wasteful means devised by man for settling industrial disputes quite irrespective of the merits of the questions involved. Moreover, strikes are distinctly bad business. Their occurrence generally argues a sad lack of tact and foresight on the part of the management. Generally also it may be safely said that the employees make unreasonable demands. But it is hard to imagine that the men are uniformly to blame. In the case of Springhill we are inclined to believe that the management is at least equally to blame. Under Manager Cowans' administration strikes have been the order of the day. Nowhere else in Canadian mining districts have industrial disturbances occurred with such regularity. We must therefore conclude that the present management is not free from blame. In fact, we can go further and state our conviction that in other hands the Springhill collieries would have been producing peacefully to-day.

We are unqualifiedly opposed to the pretensions of the U. M. W. A. This attitude, however, cannot prevent us from recognizing the failings of employers. In short, we can see nothing that can sufficiently justify the unenviable record of the Springhill collieries during the regime of the present management.

A PROTEST FROM COBALT.

The Canadian Mining Journal voiced the first protest against the inaccurate statements issued by the Conservation Commission regarding the fatality rate in Cobalt mines. Later the Canadian Mining Institute passed a resolution correcting these inaccuracies. One more protest, this time from the Temiskaming Mine Managers' Association, appears on another page of this issue of the Journal.

In an editorial published on February 15th, we referred thus to Mr. Sifton's speech:—

"In his exceptionally forceful address, delivered at Ottawa on January 18th, Mr. Sifton covered a great deal of ground. . . . Mr. Sifton made certain specific references to mining and minerals. Several of these are absolutely incorrect, one or two are absurdly wrong, and others are tinctured with error. Before discussing these in detail, it is well to state that we are perfectly in accord with the spirit that pervades Mr. Sifton's address. It is obvious, however, that in facts and figures relating to mining some one has been leading him very much astray. For various good reasons, including strong internal evidence, we believe that Dr. Haanel is responsible."

The protest of the Temiskaming Mine Managers' Association deals with an article written by Dr. Haanel, and published in the February number of "Industrial Canada." In the course of the article Dr. Haanel uses precisely the same figures that were used by Mr. Sifton, and makes the same disparaging remarks concerning Canadian metallurgical practice. And, as pointed out in the Association's protest, he has made no formal correction of these inexcusable misstatements, although their erroneousness has been brought to his notice, not once, but many times.

It is appropriate here to remark that ample and prompt apology should be demanded of Dr. Haanel as Director of the Mines Branch. Gratuitous criticisms from a public official are offensive enough; but when those criticisms are based upon inaccurate information and are spread broadcast over the country, they constitute a grave breach of decorum. In the words of the Temiskaming Mine Managers' Association, the episode "has done much to undermine the faith of mining men in its statistics and suggestions." This is literally true. How can the public be expected to place confidence in a department whose official head is permitted, without rebuke from his Minister, to discredit Canadian mining and metallurgical practice!

We are sincerely glad to have the entirely unsolicited support of the Cobalt mine managers. Our own earlier remarks concerning Dr. Haanel were written only after mature deliberation. That these remarks were not uncalled-for is now sufficiently evident.

Before leaving this painful subject we must take exception to one paragraph in the "Statement of the Temiskaming Mine Managers' Association." While we have every reason to believe that good results are now being obtained at Copper Cliff, Thorold, and Deloro, yet we cannot accept this as proving that present processes for treating cobalt-silver ores are not susceptible of material improvement. There is nothing final in metallurgy. Improvements are being made weekly and daily. Radical changes may be introduced at any time. But these changes and improvements can only be arrived at by experienced specialists. The Mines Branch will meet with nothing but encouragement and support in any sane efforts that it makes in furthering this branch of metallurgy. On the other hand, the Mines Branch will irrevocably lose its usefulness if its official head is per

mitted to disparage the work of men who are infinitely his superiors in technical attainments.

Incidentally, it may be well to refer to a letter, signed by Mr. Louis Simpson, that appeared without comment in our issue of April 1st. This letter illustrates admirably the evil effects that have followed Dr. Haanel's unwise strictures. Otherwise the letter calls for no special comment.

In closing we wish to state that we regret profoundly that it ever became necessary for us to attack the Mines Branch. That department is capable of good work, if it followed the footsteps of the corresponding branch of the United States Geological Survey. But as long as its energies are in any degree devoted to anything but furthering the interests of mining, just so long will the Mines Branch be a menace to the mining industry of Canada.

THE DAVIS HANDBOOK OF THE COBALT SILVER DISTRICT.

After many delays, occasioned largely by difficulty in obtaining the latest data as to each incorporated company, "The Davis Handbook of the Cobalt Silver District" has made its appearance.

Heretofore it has been a singularly arduous matter to secure without unreasonable loss of time full facts bearing upon the capitalization, directorate, management, equipment, and financial standing of any given Cobalt company. In the "Davis Handbook" all these data are set forth. Complete statistics of dividends paid, ore outputs, etc., are given in tabular form. Also, a list, corrected up to date, of all Cobalt incorporations is presented.

We know that for our own use Mr. Davis' book will prove a blessing. We believe that to Canadian and foreign investors and professional men it will be a time-saver. More especially will the overworked editor, to whom everyone looks for information, rise up and call the book blessed.

It is worthy of remark that this is the first attempt to gather into one volume all necessary facts concerning Cobalt. The Davis Handbook is the crystallized result of several years of hard work. As such it deserves the support of all interested in Canadian mining.

EDITORIAL NOTES.

The Willett Cobalt Silver Mines, Limited, is a recent incorporation. In the literature published by that company statements are made to the effect that native silver discoveries of some importance have been made on their claims. We are informed, from reliable sources, that no silver discoveries have been made on these claims. This kind of superfluous bad faith is too common. It is high time that the laws bearing on such misdemeanours were made automatic.

Many guesses have been made as to the actual motives that incited the Forget-Osler group to put up such a costly fight for control of the Nova Scotia Steel & Coal Company. In the fullness of time, no doubt, the inside history will leak out. Meanwhile the old directorate has been stirred into a state of unnatural activity.

In Great Britain the violent craze for shares in rubber companies continues unabated. The ordinarily phlegmatic Britisher is capable of wild indiscretion when once he has made up his mind to speculate. An English contemporary, after gathering statistics concerning the leading rubber properties, calculates that on nominal capital the average value of each rubber tree is only £0.31, whilst at the present market valuation the value is inflated to £2.09.

"Dr." Hugo Von Hagen, to whom we paid some attention last year, has placed his mining enterprises in the hands of a receiver. Von Hagen's action against the Colliery Guardian, of London, England, has been dismissed. The worthy Von Hagen failed to deposit security for costs. It is high time for this fakir to be placed under lock and key.

According to the annual report the Dominion Coal Company's net earnings during 1909 were $1,113,091.09. Total dividends paid amounted to $810,000. The carry-forward was $394,419.42. It may be noted that the net earnings during 1908 were $2,686,202.

Granby directors announced on April 5th that, in view of unfavourable reports being circulated regarding the condition of the Granby Mines, they have decided to engage competent mining engineers to examine and report exhaustively upon the properties. The examination will cover several months.

Available silver reserves in Bombay are reported to be much reduced. General trade is so flourishing in India that it is believed that the Indian Government will shortly make large purchases of silver for coinage.

The perennial rumour of the discovery of coal in Northern Ontario is now going the rounds. We notice that the finds are always announced when the snow is still on the ground. Yet, in the present case there appears to be more than ordinary hope. The seam of lignite that has been discovered shows an excellent analysis and a very respectable thickness. Therefore, in the absence of full facts, it is only just to say that the new discovery may mean much to the Province of Ontario.

NOTES ON PORTLAND CANAL MINING DISTRICT, B.C.

Written for the Canadian Mining Journal by William W. Rush.

The Bear River Mining district, situated at the head of Portland Canal, B. C. occupies a strip of land about 25 miles long by 5 wide, drained by Bear River. The country is rugged and but for its proximity to tidewater would be difficult of access. The Bear River bars afford a natural highway into the heart of the district, and the Provincial Government has been generous in the matter of roads and trails. A 50 foot roadway has been cleared and partially graded for twelve miles up Bear River with tributary horse trails into the hills. Bear River has been spanned by a 1400 foot bridge and a dock has been built at Stewart, the port and distributing point for the district. A railroad and extensive additions to the systems of roads and trails are assured for the coming season.

George E, Tunnel—Glacier Creek Mining Co

The recurrent psychological phenomenon known and vituperated as the "mining boom" was responsible for the beginnings of the camp as it is for the latest phase in its development. It was the Klondike excitement of .98 which attracted gold seekers to the Canal to look for placer diggings at the head of Bear River and Naas. Their search was unsuccessful, but the presence of base metals was noted, and as a result of their explorations the first lode claims of the district were staked—the "Roosevelt" in 1899, and the "Stewart" property on American Creek in 1902. The fame of these discoveries and the explorations carried on by M. K. Rodgers and associates, attracted numerous other prospectors to the district and in 1905 important discoveries were made on Glacier Creek.

The district lies on the eastern flank of the Coast Range granites and the mineral deposits occur for the most part in slates, quartzites and silicous limestones (or argillites). These rocks are often schistose but the schistosity is not so general or so marked as on the western flank of the granite. Diabase and other ig-

neous rocks occur but their relation to the ore bodies has not been determined. As the proximity of the Coast Range intrusives would suggest, the metamorphism of the sedimentaries is universal. No fossils have been found.

Discoveries made thus far indicate that the predominate products of the district will be silver and lead, but deposits of gold and copper are also found. The

Miner's Cabin.

most notable exception to the ordinary type of deposit is the "Red-Cliff" on American Creek, a large irregular deposit of iron and copper-iron sulphides with primary gold values. The Red Creek Mining Company after proving the existence of a large ore body is at present engaged in driving a long crosscut at a low level to work as a working adit. A compressor and machine drills are being installed. A very promising cop-

Bridge on Bear River.

per prospect is found on M. K. Rodgers' Northern Belle claims situated on the Middle Fork of Glacier Creek. Other copper locations have been made near the head of Bear River but little developement work has been done.

Five miles above the "Red Cliff" on American Creek lies the Stewart property to which previous reference has been made. The mineral deposits on these claims have been described as a succession of sheer zones. At the tunnel the stains of copper carbonate and the absence of pyrite and limonite are conspicuous features . The mineralization consists of galena and other argentiferous sulphides in a quartz gangue. High silver values are reported. This property has attracted much attention among mining men for a number of years. A company financed by D. D. Mann and associates, of Toronto, will begin its exploitation next summer.

But by far the greatest amount of prospecting and developement work has been done on Glacier Creek. In this section the Portland Canal Mining Co. has opened up a strong vein following the formation along the contact between a sill of porphyry and the slate. The dip is southwest from 20° to 40°. Development has been progressing for several years on this property and there is a large quantity of ore blocked out and

Tunnel on Sunbeam Claim—Stewart Mining and Development Co.

ready for stoping. A mill and aerial tramway are in course of construction. The same vein or vein zone has been traced from the "Jumbo" and "Eurus" on the southeast to the works of the Stewart Mining and Development Co. on the northwest, a distance of 3 miles. On the latter property three parallel veins outcrop at an altitude of about 1100 feet. A tunnel is being driven on the "George E" to crosscut these veins at a depth of 180 feet. Two of the veins have been encountered thus far. The mineralization along this vein zone consists of galena, pyrite, zinc blende, argentite and native silver in a gangue of quartz and brecciated slate. Parallel blanket veins in similar geologic conditions and with similar minerals and gangue occur over a considerable area.

On the Middle Fork of Glacier Creek a series of veins occur that cut the formation at varying angles and dip vertically or nearly so. The usual vein minerals are galena, blende, pyrite, arsenopyrite, stibnite, and grey copper in a gangue of barite, quartz and sericitized rock. The Columbia-Evening Sun vein is a conspicuous example of this class. The Excelsior-Eagle

vein has a similar strike and identical vein minerals. The galena and grey copper of these veins carry uniformly high silver values. Most of the property in this section has been acquired by a syndicate organized by

winter and of these the Portland Canal Mining Co. will be the first to emerge into the producing stage. With the energetic development that this season will bring several others will follow in close succession. Natural conditions are on the whole by no means unfavourable to mining operations. Timber and water power are abundant. Owing to the influence of the sea, winters are less severe than in many districts of the States. On the other hand in certain localities there are dangerous slides that must be reckoned with.

Several steamship companies will each provide regular passenger service between Vancouver and

Head of Portland Canal.

Stewart this summer and local boats will leave Prince Rupert almost daily. Some of the usual discomforts incident to new mining camps may be expected, but

American Creek, flowing into Bear R v

food ,fuel and water are abundant and there will be no hardships comparable to those encountered by stampeders in the desert camps or in the frozen Yukon.

Many years ago, when the Woodstock mine in New Zealand was worked as an independent proposition, many pounds of cyanide of potassium were used to treat a ton of ore. It was found that in roasting the ore a considerable quantity of wood ash got mixed in the ore. As the cyanide had a greater affinity for the wood ash than for the gold, it was neutralized, and resulted in a large cyanide consumption. Lime burnt in open kilns often contains partially burned coal or wood ash, which has an adverse effect on the cyanide. Where lime burned in retorts cannot be obtained, that fed into the cyanide plant should be in the form of a solution or as a thin emulsion. In cases where the pulp is excessively acid wood ash may become useful for neutralizing acidity. The ash should, however, be leached rather than fed into the pulp, on account of the precipitations caused by the unburned charcoal.

CANADIAN IRON AND STEEL.

By Watson Griffin.

II.

The Dominion Iron and Steel Company.

The largest iron and steel plant in Canada is that of the Dominion Iron and Steel Company, whose works are located on a site 440 acres in extent in the city of Sidney, Cape Breton, in the province of Nova Scotia. The company's deep-water frontage on Sydney harbour available for docks accommodating large vessels is 2,400 feet. The works at present include four blast furnaces, having a capacity of over one thousand tons daily, when all are in operation, ten 50-ton open hearth furnaces, two Bessemer converters in connection with the open hearth department for the purpose of shortening the process of steel making in the open hearth furnaces by the elimination of silica and some of the other impurities in the pig iron previous to treatment in the open hearth furnaces, a 36-in. blooming mill and pit furnaces, a 28-in. rail mill of 1,000 tons daily capacity, a rod mill of over 7,000 tons capacity monthly, a continuous billet mill of 600 tons daily capacity, 500 Otto Hoffman coke ovens, coal-washing, sulphuric acid and by-product plants, and a large machine shop and foundry.

The output of the whole plant has been restricted in the past owing to the fact that the capacity of the coke ovens is not sufficient to supply enough fuel for the blast furnaces. The capacity of the steel plant, taking into consideration its present equipment of coke ovens and blast furnaces, is about 300,000 tons of steel ingots per annum, but extensive enlargements and improvements are under way which will increase the capacity of the plant from one-third to one-half. The chief additions are two large batteries of Otto Hoffman coke ovens, a 300-ton blast furnace, two 50-ton open hearth furnaces, and a plant for briquetting waste metal and reducing it to a form more adaptable for use as a boiler fuel.

The capacity of the rail mill and rod mill have never been fully tested because the company has never been able to make sufficient steel owing to the cause already explained. However, about 152,500 tons of rails and 73,000 tons of rods have been produced in one year, besides about 22,000 tons of other rolled material. When the present additions to the steel-making plant are completed these figures will, no doubt, be largely increased.

In October, 1903, this company entered into a contract with the Dominion Coal Company whereby the coal company undertook to furnish the steel company with all the coal required for the operation of four blast furnaces and the conversion of this product into various forms of steel manufacture at the price of $1.24 per ton, with four cents additional for the use of the cars, or $1.28 per ton laid down at the works. This contract is to be in force as long as the coal company's leases from the Government, which have still over eighty-two years to run, but once in five years there is to be an arbitration to determine whether there has been any increase in the actual cost of mining coal, and the price may be increased to the extent of any increase in the cost of mining. There was a legal dispute as to the meaning of this contract, but it was decided in favour of the steel company. The relations between the steel and coal companies are now of a very friendly nature, the steel company and its friends having become the owners of a very considerable part of the common stock of the coal company. At present the two companies are maintaining their independent existence, although they have a president, general manager and superintendent of mines in common and ultimately a closer merger of interests is likely to be brought about.

The Dominion Iron and Steel Company has immense deposits of iron ore of good quality in Bell Island, Conception Bay, Newfoundland, about 400 miles from Sydney. English mining engineers have estimated that there is enough ore in the areas already opened up by the company to supply a plant larger than that now in existence at Sydney for over a hundred years to come, and there are outer areas belonging to the company which, if the seams are continuous, as is supposed, would probably yield a much larger quantity of ore than the areas now being worked.

The ore has a good percentage of iron. It is low in sulphur, but rather high in phosphorus. It can be mined very cheaply and as the mines are close to deep water docks, while the blast furnaces of the Dominion Iron and Steel Company are close to Sydney Harbour, the ore can be transported at very low cost.

The company owns a very large limestone property in Marble Mountain, on Bras d'Or Lake, about 70 miles from Sydney, where there is a practically unlimited supply of high grade limestone available for shipment by water. There are also limestone and dolomite quarries at George's River, near Sydney.

The capital of the Dominion Iron and Steel Company is $20,000,000 common stock and $5,000,000 seven per cent. cumulative preferred stock. The bonded indebtedness of the company is $13,332,000.

The directors of the Dominion Iron and Steel Company are:—Mr. J. H. Plummer, President, Sir H. Montague Allan, Geo. Caverhill, Hon. Geo. A. Cox, H. F. Dimock, Hon. L. J. Forget, Hon. Robt. Mackay, Hon. David Mackeen, Wm. McMaster, Frederick Nicholls, Elias Rogers, W. G. Ross, and Sir Wm. C. Van Horne.

The Dominion Coal Company Board is as follows:—J. H. Plummer, President, F. L. Wancklyn, Lord Strathcona, Sir Henry Pellatt, Hon. Geo. A. Cox, Hon. L. F. Forget, H. F. Dimock, James Crathern, W. D. Matthews, and Jas. Reid Wilson, with two vacancies to fill.

The Nova Scotia Steel and Coal Company.

The Nova Scotia Steel and Coal Company has works in Cape Breton Island and Pictou County, Nova Scotia. The Cape Breton Island plant, which is located at Sydney Mines, about two miles from the port of North Sydney, operates under much the same conditions as the Dominion Iron and Steel Company as regards raw materials. It has now its own coal mines close at hand and like the Dominion Iron and Steel Company it gets iron ore from Bell Island. H. Kilburn Scott, an eminent English engineer, estimated last summer that in the Wabana iron areas at Bell Island owned by the Nova Scotia Steel and Coal Company there were 206,000,000 tons of iron ore practically proved and of iron ore reasonably supposed to exist more than twice as much. Nearly all this ore is under the sea, but the company reports that it has been driving tunnels and slopes in it without any inconvenience on that account. The ore is about the same quality as that of the Dominion Iron

and Steel Company. When the ore reaches the company's docks at the port of North Sydney it is transported to the blast furnace at Sydney Mines, about two miles distant, on the company's own railway, which is also used for carrying coal to the shipping pier.

Besides the Newfoundland mine the Nova Scotia Steel and Coal Company has iron areas in Cape Breton, Pictou and Guysborough Counties in Nova Scotia, but at present none of them are being worked and the value is uncertain. This company formerly had a blast furnace at Ferrona in Pictou County, which ran successfully for some years on Pictou County ores. Wabana ore from Bell Island was also used in this furnace, but as this ore, which was practically unlimited in quantity and very cheaply mined, could be laid down at Sydney Mines much more economically than at Ferrona the Pictou County furnace was finally shut down. The company had five collieries at Sydney Mines besides the Marsh Mine near New Glasgow in Pictou County.

H. Kilburn Scott, the same English engineer who estimated the value of the iron areas of the company, estimated that its coal areas contained of coal practically proved 270,000,000 tons and of coal reasonably supposed to exist 1,068,000,000 tons. These coal areas are largely submarine. The present output is 900,000 tons per annum and can easily be increased to 1,000,000.

The limestone properties of the company at present operated are situated at Point Edward about ten miles from the blast furnace. They contain about 2,000,000 tons of limestone of very high grade, which is transported by rail to the works. This company has other extensive limestone deposits somewhat farther away but situated at a point where the limestone can be easily transported by water. These deposits are of exceptionally fine quality and are said to contain over 98 per cent of carbonate of limestone and magnesia.

The blast furnace at Sydney Mines has a capacity of 200 tons per day. There are three batteries of coke ovens of forty ovens each of the Bernard Retort type, and one battery of thirty ovens of the Bauer Retort type. The coal washing plant has a capacity of fifty tons per hour. The company has three 40-ton steel furnaces, the basic Siemens-Marten process being used. The capacity is 400 tons of ingots per day.

The works at Trenton, near New Glasgow, in Pictou county, consist of rolling mills, forges and various finishing machines for the production of spikes, bolts and nuts, polished shafting and other finished material, having a capacity of 50,000 tons of finished material per year, in addition to 50,000 car axles weighing about 15,000 tons. The fuel is nearly all obtained from the surrounding collieries at Westville and Stellarton.

The company has issued $1,030,000 preferred stock, $6,000,000 common stock, $1,000,000 six per cent. debenture stock, and $3,500,000 of five per cent. first mortgage bonds, while $2,500,000 five per cent. mortgage bonds remain in the treasury.

The directors of the Nova Scotia Company for the past year were: Robt. E. Harris, K.C., President; Hon. James D. McGregor, Vice-President; Thomas Cantley, General Manager; J. Walter Allison, Robert E. Chambers, James C. McGregor, Hon. Robert Jaffray, George F. McKay, John McNab, Hon. J. S. Pitts and Robert Reford. A dispute has arisen regarding the recent election of the same Board of Directors, Mr. Rodolphe Forget, of Montreal, who favours a change, claiming that he and his friends control a majority of the shares.

The Canada Iron Corporation.

The Canada Iron Corporation is a merger of the interests of the following companies:

The Canadian Iron and Foundry Company, Limited.

The Canada Iron Furnace Company, Limited.

John McDougall & Company (Drummondville Works).

The Annapolis Iron Company, Limited.

The corporation has blast furnaces at Midland, Ont., Radnor Forges, Que., and Drummondville, Que., with a total capacity of over 125,000 tons of coke pig iron and 14,000 tons of charcoal pig iron per annum, while it has large foundries and well equipped machine shops at Midland, Fort William, Hamilton and St. Thomas in the Province of Ontario, Three Rivers in the Province of Quebec and Londonderry in the Province of Nova Scotia. These six factories have a total daily capacity of 70 tons ingot moulds, 115 tons castings, 150 tons car wheels, and 205 tons of cast iron water and gas pipes.

The Midland works are located on the north side of the harbour of Midland, the corporation having a large acreage along the water front, with ample room for the construction of a large iron and steel plant. The docks have a length of 2,400 feet, with about twenty feet of water.

Midland was selected partly because of its central position in Ontario, which is the chief iron consuming province of the Dominion, having a large number of manufacturing towns which can be conveniently reached from Midland, and partly because, having one of the finest harbours, on Georgian Bay, it is a convenient point for the assembling of raw materials by water from Northern Ontario and Michigan, while the rail haul from the iron mines of Eastern Ontario is short. At present there is one blast furnace in operation at Midland with a capacity of 150 tons per day, but when the new furnace now nearing completion, is in operation, the plant will have a capacity of over 125,000 tons per annum.

Coke from Connellsville, Pa., is used, and the limestone is obtained from quarries belonging to the corporation on the eastern shore of Midland Bay about five miles from the furnace.

The furnaces at Radnor Forges and Drummondville make an exceptionally fine quality of charcoal iron especially adapted for the manufacture of car wheels and high grade special castings. Local bog iron ores, which are remarkably free from phosphorus and sulphur are chiefly used although some high grade iron ore is brought from Eastern Ontario. The furnace at Radnor Forges has a capacity of 9,000 tons and that at Drummondville 5,000 tons.

The mineral areas owned by the corporation are:—The Drummond Iron Range located at Bathurst in the County of Gloucester in the Province of New Brunswick, comprising five square miles of non-Bessemer hematite and magnetic ores of good quality.

The Annapolis Iron Areas in Annapolis County in the Province of Nova Scotia, covering an area of seven square miles containing a non-Bessemer ore, low in sulphur and moderately high in phosphorus.

The Eganville Iron Mine in Renfrew County, Ontario, containing high grade magnetic ore of non-Bessemer quality.

Development work is being proceeded with at the Drummond Iron Range in connection with which the corporation is now constructing the Northern New Brunswick and Seaboard Railway from the mines to Bathurst, a distance of about 26 miles. This line will

be completed to connect with the Intercolonial Railway within the next few months and shipments of ore will then be made to Newcastle, where extensive ore docks, with facilities for handling upwards of 3,000 tons of ore per hour are under construction and will probably be completed soon after the opening of the shipping season this year.

Extensive development work has been done at the Annapolis mine and in connection with this the corporation and Messrs. Mackenzie, Mann and Company are jointly converting the dock at Port Wade, N.S. into an up to date ore handling and shipping dock. This dock will have a capacity of 3,000 tons per hour and is expected to be ready to make shipments on the opening of the coming shipping season.

The directors of the Canada Iron Corporation are:—Thos. J. Drummond, President, Edgar McDougall, Vice-President and General Manager, Geo. E. Drummond, Vice-President, Geo. Gudewill, H. Cockshutt, A. E. Dyment; London Committee of Directors,—Sir James Heath, I. Hamilton Benn, R. W. Cooper, J. R. Tennant; Secy-Treas., F. G. O'Grady; Controller A. K. Fisk.

The Londonderry Iron and Mining Company.

The Londonderry Iron and Mining Company has at Londonderry, Colchester County, Nova Scotia, a blast furnace of 100 tons capacity, an ore crushing and mixing plant, coal washing plant, and ninety-seven coking ovens with a capacity of 150 tons per day. It owns in Colchester County 30,000 acres of freehold on which are iron ranges containing large quantities of ore very low in sulphur, much lower in phosphorus than most of the Nova Scotia ores and free from titanium. There are a number of varieties, including hematite, limonite, ankerite, siderite and specular ores. At the blast furnace ankerite (limestone containing a small percentage of iron) is used as a flux and coal is brought from Springhill, in Cumberland County, and from Pictou County.

The furnace has been out of blast for some time owing to the miners' strike at Springhill.

The company has recently completed a first-class steel casting department, with a capacity of 5,000 tons per annum.

The authorized capital of the company is $1,000,000. The officers and directors are: T. J. Drummond, president; Edgar McDougall, Vice-President; George E. Drummond, John J. Drummond, and James T. McCall; Secretary-Treasurer, F. G. O'Grady.

The Lake Superior Corporation.

The Algoma Steel Company, the Lake Superior Iron and Steel Company and the Algoma Iron Works are all subsidiary companies of the Lake Superior Corporation, which, through other subsidiary companies, also owns the famous Helen Iron Mine at Michipicoten, and other mines, extensive timber limits, the great electric power plants on both sides of the Soo, the street car lines in the Soo towns, an extensive electric lighting system, a ground wood pulp mill, a sulphite mill, reduction works, a copper-nickel converter plant and nickel matte smelter, an electric furnace, a saw mill, a veneer mill, a brick plant, the Algoma Central and Hudson Bay Railway, the Manitoulin and North Shore Railway, and a number of steamships.

The present iron and steel plant includes two blast furnaces, having a capacity of 300 tons each per day; a Bessemer steel department with two converters, having a capacity of 800 tons ingots per day; three 40-ton basic stationery open hearth furnaces, with a capacity of 300 tons ingots per day, a 34-inch blooming mill and 24-inch rail mill, with a capacity of 1,000 tons of steel rails per day; a foundry and machine shop. There are now under construction, and will be completed this summer, new blast furnaces with a capacity of 500 tons per day; one 12-inch rolling mill; one 18-inch rolling mill; three additional open-hearth furnaces of 40 tons capacity each; a rod mill, billet equipment, complete machinery for the manufacture of spikes, bolts, nuts, railway fastenings and tie plates, and two batteries of the Koppers' by-product coke ovens, with a capacity of 1,300 tons of blast furnace coke per day, with a complete by-product plant for the production of tar and ammonia sulphate. In connection with the construction of the new blast furnaces, four gas blowing engines of 2500 H.P. each, operated on blast furnace gas, are being installed to replace steam blowing engines and four gas engines of the same capacity with 1500 K.W. generators to supply electric power to operate the two new rolling mills, and power for direct current motor, 1500 H.P. which is being installed to operate the blooming mill in place of steam engine, it being the intention to have all mills operated electrically. New ore and coal docks are being constructed, equipped with the most modern ore handling and coal unloading machinery, and new machinery for the loading of steel rails on vessels. The total length of the ore docks is 2,000 feet and coal docks 1,200 feet; all being connected with deep water above the Soo rapids.

The Helen Iron Mine is about 11 miles from the Lake Superior port of Michipicoten with which it is connected by a railway belonging to the corporation. From Michipicoten the ore is carried on the corporation's own boats to the works at the Soo which are about 125 miles distant. Considerable quantities of the ore are sold to other companies in Canada and the United States. The ore bed from which shipments have been chiefly made is a hard, red hematite containing about 60 per cent. of iron, low in sulphur and containing about .125 phosphorus. Dr. Bell of the Geological Survey, some years ago said it contained at least 26,000,000 tons of ore and probably many millions more. The corporation recently drove out under Lake Boyer, adjoining the Helen mine, and struck into a body of Bessemer ore of exceptionally good quality carrying about .02 to .03 phosphorus. Development work has been begun and there are believed to be large quantities of this ore.

The works at the Soo use in addition to the Helen ore a considerable quantity of Bessemer ore from Minnesota and Michigan, which is brought across Lake Superior by boat at a very low rate. The corporation owns large areas of limestone property on St. Joseph Island and Cockburn Island, a distance of about forty miles from the works, which can be brought in by boat at a very low cost. In addition they are interested in large limestone deposits in Northern Michigan, forty miles from the works, the limestone being shipped to the Soo by rail at a low freight rate. This limestone runs about 98% in fluxing qualities. The property also contains a high grade dolomite, which is used in the open hearth furnaces. Coal has to be imported from the United States and is handled from Lake Erie ports to the works by boat during the season of navigation.

The capital stock of the Lake Superior Corporation is $40,000,000 and its bonded indebtedness $13,000,000. The directors are:—T. J. Drummond, President, J. Tatnall Lee, W. K. Whigham, J. Fraser Taylor, T. Gibson, F. McOwen, H. M. Price, R. L. Austin, Jos. S. Dale, H. M. Coppell, John T. Ferry and J. S Lovell.

The Hamilton Steel and Iron Company.

The works of the Hamilton Steel and Iron Company are at Hamilton, Ont. The plant includes two coke blast furnaces with a capacity of 550 tons per day, four open hearth steel furnaces with an annual capacity of 100,000 tons located on the shore of Burlington Bay at the east end of Hamilton, and puddling furnaces, rolling mills and forging department on Queen Street near the Grand Trunk Station at the west end of the city.

The coke comes from Connellsville, Pa., the iron ore from Michipicoten and the Michigan iron ranges, the limestone from Dundas, Ont., a few miles from the works.

While all the materials except limestone have to be brought from a distance, Hamilton is very favourably situated for the assemblage of coke and iron ore from outside points, having first class rail and water communication. Cheap electric power can be obtained from Niagara or from the Cataract Power Company which transmits power to Hamilton from De Cew Falls, a few miles from St. Catharines. Cheap natural gas is available, being brought to Hamilton from wells in the vicinity.

The capitalization of the Hamilton Steel and Iron Company is $3,000,000. There are no bonds or preferred stock. The directors are: Charles S. Wilson, President; Robert Hobson, Vice-President and General Manager; William Southam, John Milne, George Lynch Staunton, Charles E. Doolittle, H. H. Champ, E. B. Osler, M.P. and W. D. Matthews.

The Atikokan Iron Company.

The Atikokan Iron Company is one of the Mackenzie and Mann enterprises. The works are located on the water front at Port Arthur, Ont., and include a blast furnace having a capacity of 100 tons per day, but so constructed that the capacity can at small cost be increased to 200 tons, 100 beehive coke ovens, with a total daily capacity of 150 tons of coke, and 16 Roberts ore roasting furnaces.

The ore used is all brought from the Atikokan Iron Mine of the company on the line of the Canadian Northern Railway, about 130 miles from Port Arthur. It has been proven that there are at least five million tons of ore and the quantity available is believed to be very much larger. The ore is magnetite. There are three veins, two of which are said to contain no phosphorus, while the third contains too much phosphorus for Bessemer use.

The high percentage of sulphur in the ore was at first considered very objectionable, but it has been found that in the Roberts roasting furnaces the sulphur can be reduced from 2.5 per cent. in the raw ore to .75 in the roasted ore at a cost of less than ten cents per ton, and the moisture is expelled from the ore in the process. Experiments in roasting have been made for three years with most gratifying results and the company are so well satisfied with the success of the process that they propose in the near future to increase their blast furnace capacity, using only Atikokan ore. This Roberts roasting plant was the second installed, but there are now several in successful operation in the United States and England.

The plant can roast 600 tons of ore per day and as the blast furnace at Port Arthur cannot use nearly that much considerable quantities of the roasted ore will be sold. It has been found that it can be profitably exported to the United States in spite of the duty. Owing to the moisture having been expelled in the process of roasting, the magnetite ore can be smelted as easily as hematite ore. A very fine quality of foundry pig iron is produced at the Port Arthur furnace from the roasted Atikokan ore.

Gas from the blast furnace is used for the blowing engines and for roasting the ore.

Coal is brought from West Virginia because it is very low in sulphur, while Kelly Island in Lake Erie supplies the limestone, low rates of transportation being secured on ore boats which would otherwise return empty, from lower lake ports to Lake Superior iron ore shipping ports.

The capital of the company is $1,000,000. The directors are:—William Mackenzie, President, D. D. Mann, Z. A. Lash, Hugh Sutherland, A. S. White, and J. Dix Fraser, General Manager.

THE USE OF COKE-OVEN GAS AS FUEL.

Paper Read Before the Mining Society of Nova Scotia By Thomas J. Brown, General Superintendent of the Nova Scotia Steel & Coal Co., Sydney Mines, N.S.

Greater economy in the use of fuel is a question always of the utmost interest to consumers. As our coal mines grow larger, haulages become longer, shafts deeper, and the many drawbacks in connection with the extraction of coal become more extensive and expensive, this question of economy in fuel becomes each day a more important one to all concerned.

In the early history of coal mining in this country, very little attention was paid to this very important item. Particularly was this true at the different collieries; as they were producing the fuel themselves, it was natural for them not to place the same amount of importance on the question of economy in the use of fuel as other consumers who had to pay more for their fuel.

Strange to say, these conditions are greatly changed, and I believe to-day that the coal operators are doing as much as anyone, if not more, towards introducing economical methods in connection with their operations, and towards the introduction of the most modern equipment as regards their power-plants, to enable them to make use of all the heat units possible, and to consume the lower grade fuels that were at one time so generally consigned to the waste dumps.

The most up-to-date and modern water-tube boilers have taken the place of the old exterior fired, egg-end, cylindrical type. High steel stacks and forced or induced draft fans have taken the place of the old 60 to 80 ft. square brick stacks so evident some years ago. Selfstokers, travelling chain grates, feed-water heaters, economizers and all the other contrivances so well known to the modern engineer, have been introduced, all with a view of further economizing the use of fuel. And, personally, I think a still greater change has taken place in the fact that nearly all plants in the early days did not have sufficient boiler power to efficiently do the work required; and that to-day engineers see the great advisability of having more power than is necessary to do the actual work, and in this way enable them to use inferior fuel, and to do the work with greater ease and less strains on the power plants than was the custom in former days.

Not only does the engineer of to-day see this, but he has, after a great deal of opposition, been able to make the governing bodies of nearly all the big cor-

porations to-day see the advisability of the great saving to be made by making the original investment for power-plant large enough to put in place a plant of sufficient power to enable them to avail themselves of the economies to be made in this way.

If a stranger visits any of the great metallurgical centres of the United States, and particularly the State of Pennsylvania, he is at once struck by the enormous quantities of escaping gas from coke-ovens, to be seen all through the country. To the man who appreciates the power and the commercial value contained in this escaping gas it is appalling. When one thinks of the ridiculously small percentage of efficiency that is extracted from each pound of coal, and when one sees this enormous waste, one cannot help but wonder why we have not reached the point where the use of this waste gas has become more general.
